1000 FIP (Federation Internationale Pharmaceutique) against higher dosages of 3000 FIP and 4500 FIP. A total of 75 patients were randomized to one of the three dosage arms, and 68 of these patients were finally analyzed in the modified intention-to-treat population. Patients involved underwent two surgery sessions: one study period being conducted under treatment with bromelain and the other with placebo. Postoperative swelling determined by a 3D face scanning system was defined as the primary endpoint; further efficacy parameters were maximum swelling, pain, difficulty in swallowing, and use of analgesics. A superiority of treatment with 3000 FIP and 4500 FIP versus 1000 FIP could not be demonstrated. The analysis of pooled bromelain treatments versus placebo did, however, show a clear trend in favor of bromelain for all assessments. Adverse events did not occur more frequently under bromelain therapy compared with placebo."

According to the news editors, the research concluded: "This study thus clearly supports the clinical relevance of treatment of postoperative conditions with bromelain, and the recommended daily dose was sufficiently effective in this trial and indication."

The news editors report that additional information may be obtained by contacting K.H. Bormann, Hannover Med Sch, Dept. of Oral & Maxillofacial Surg, D-30625 Hannover, Germany. Additional authors for this research include K. Weber, H. Kloppenburg, A. Koch, P. Meiser and N.C. Gellrich.

Keywords for this news article include: Hannover, Germany, Europe, Cysteine Endopeptidases, Enzymes and Coenzymes, Peptide Hydrolases, Bromelains, Placebos, Therapy, School of Medicine.

**Molecular Nutrition**

**Studies from School of Public Health Yield New Information about Molecular Nutrition (Influence of maternal hypercholesterolemia and phytosterol intervention during gestation and lactation on dyslipidemia and hepatic lipid metabolism in ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Molecular Nutrition are presented in a new report. According to news reporting originating from Buffalo, New York, by NewsRx correspondents, research stated, "Scope: Although there is a normal physiological rise in maternal lipids during pregnancy, excessive maternal hyperlipidemia during pregnancy increases cardiovascular disease risk for both the mother and offspring. There are limited safe lipid-lowering treatment options for use during pregnancy, therefore, we evaluated the influence of maternal phytosterol (PS) supplementation on lipid and lipoprotein metabolism in mothers and progeny."

Financial support for this research came from National Center for Complementary and Integrative Health.
Our news editors obtained a quote from the research from the School of Public Health, "Female Syrian golden hamsters were randomly assigned to three diets throughout prepregnancy, gestation, and lactation (n = 6/group): (i) Chow (Chow), (ii) chow with 0.5% cholesterol (CH), and (iii) chow with 0.5% CH and 2% PS (CH/PS). Compared with newly weaned pups from Chow dams, pups from dams fed the CH-enriched diet demonstrated increases (p < 0.05) in total-C, LDL-C, HDL-C, and total LDL and VLDL particle number. Pups from CH-fed mothers also exhibited higher hepatic CH concentration and differential mRNA expression pattern of CH regulatory genes. Pups from PS-supplemented dams demonstrated reductions (p < 0.05) in serum total-C, non-HDL-C, and LDL-C but also increased triglycerides compared with pups from CH-fed dams. Maternal PS supplementation reduced (p < 0.05) hepatic CH and increased the abundance of HMG-CoAr and LDLr protein in newly weaned pups compared with the CH group."

According to the news editors, the research concluded: "Results suggest that maternal PS supplementation is largely effective in normalizing CH in pups born to mothers with hypercholesterolemia, however, the cause and long-term influence of increased triglyceride is not known."

The news editors report that additional information may be obtained by contacting T.C. Rideout, SUNY Buffalo, Sch Public Hlth & Hlth Profess, Dept. of Exercise & Nutr Sci, Buffalo, NY 14228, United States. Additional authors for this research include A. Iqbal, A. Raslawsky, R.W. Browne, M.S. Patel and T.C. Rideout.

**Studies from Scripps Research Institute in the Area of Myotonic Dystrophy Reported (Development of pharmacophore models for small molecules targeting RNA: Application to the RNA repeat expansion in myotonic dystrophy type 1)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Musculoskeletal Diseases and Conditions - Myotonic Dystrophy. According to news originating from Jupiter, Florida, by NewsRx correspondents, research stated, "RNA is an important drug target, but current approaches to identify bioactive small molecules have been engineered primarily for protein targets. Moreover,
the identification of small molecules that bind a specific RNA target with sufficient potency remains a challenge."

Funders for this research include National Institutes of Health, Muscular Dystrophy Association.

Our news journalists obtained a quote from the research from Scripps Research Institute, "Computer-aided drug design (CADD) and, in particular, ligand-based drug design provide a myriad of tools to identify rapidly new chemical entities for modulating a target based on previous knowledge of active compounds without relying on a ligand complex. Herein we describe pharmacophore virtual screening based on previously reported active molecules that target the toxic RNA that causes myotonic dystrophy type 1 (DM1). DM1-associated defects are caused by sequestration of muscleblind-like 1 protein (MBNL1), an alternative splicing regulator, by expanded CUG repeats (r(CUG)(exp)). Several small molecules have been found to disrupt the MBNL1-r(CUG)(exp) complex, ameliorating DM1 defects. Our pharmacophore model identified a number of potential lead compounds from which we selected 11 compounds to evaluate."

According to the news editors, the research concluded: "Of the 11 compounds, several improved DM1 defects both in vitro and in cells."

The news correspondents report that additional information may be obtained from M.D. Disney, Scripps Florida, Scripps Res Inst, Dept. of Chem, Jupiter, FL 33458, United States. Additional authors for this research include A.L. Gonzalez, S.G. Rzuczek and M.D. Disney.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.bmcl.2016.10.037. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Gastric Cancer**

**Studies from Second Affiliated Hospital of Harbin Medical University Provide New Data on Gastric Cancer (Aberrant expression of the candidate tumor suppressor gene DAL-1 due to hypermethylation in gastric cancer)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gastric Cancer. According to news reporting originating in Harbin, People's Republic of China, by NewsRx journalists, research stated, "By allelotyping for loss of heterozygosity (LOH), we previously identified a deletion region that harbors the candidate tumor suppressor gene DAL-1 at 18p11.3 in sporadic gastric cancers (GCs). The expression and function of DAL-1 in GCs remained unclear."

The news reporters obtained a quote from the research from the Second Affiliated Hospital of Harbin Medical University, "Here, we demonstrated that the absence of or notable decreases in the expression of DAL-1 mRNA and protein was highly correlated with CpG hypermethylation of the DAL-1 promoter in primary GC tissues and in GC cell lines. Furthermore, abnormal DAL-1 subcellular localization was also observed in GC cells. Exogenous DAL-1 effectively inhibited cancer cell proliferation, migration, invasion and epithelial to mesenchymal transition (EMT); exogenous DAL-1 also promoted apoptosis in GC AGS cells. When endogenous DAL-1 was knocked down in GC HGC-27 cells, the cells appeared highly aggressive. Taken together, these findings provide solid evidence that aberrant expression of DAL-1 by hypermethylation in the promoter region results in tumor suppressor gene behavior that plays important roles in the malignancy of GCs."

According to the news reporters, the research concluded: "Understanding the role of it played in the molecular pathogenesis of GC, DAL-1 might be a potential biomarker for molecular diagnosis and evaluation of the GC."

For more information on this research see: Aberrant expression of the candidate tumor suppressor gene DAL-1 due to hypermethylation in gastric cancer. Scientific Reports, 2016;6():21755. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news correspondents report that additional information may be obtained by contacting H. Wang, Dept. of Hepatopancreatobiliary Surgery, the Second Affiliated Hospital of Harbin Medical University, Harbin 150081, People's Republic of China. Additional authors for this research include M. Xu, X. Cui, Y. Liu, Y. Zhang, Y. Sui, D. Wang, L. Peng, D. Wang and J. Yu.

stated, "We determined the characteristics of Chinese men undergoing initial prostate biopsy and evaluated the relationship between prostate specific antigen levels and prostate cancer/high grade prostate cancer detection in a large Chinese multicenter cohort. This retrospective study included 13,904 urology outpatients who had undergone biopsy for the indications of prostate specific antigen greater than 4.0 ng/ml or prostate specific antigen less than 4.0 ng/ml but with abnormal digital rectal examination results."

Our news journalists obtained a quote from the research from Second Military Medical University, "The prostate specific antigen measurements were performed in accordance with the standard procedures at the respective institutions. The type of assay used was documented and recalibrated to the WHO standard. The incidence of prostate cancer and high grade prostate cancer was lower in the Chinese cohort than the Western cohorts at any given prostate specific antigen level. Around 25% of patients with a prostate specific antigen of 4.0 to 10.0 ng/ml were found to have prostate cancer compared to approximately 40% in U.S. clinical practice. Moreover, the risk curves were generally flatter than those of the Western cohorts, that is risk did not increase as rapidly with higher prostate specific antigen. The relationship between prostate specific antigen and prostate cancer risk differs importantly between Chinese and Western populations, with an overall lower risk in the Chinese cohort. Further research should explore whether environmental or genetic differences explain these findings or whether they result from unmeasured differences in screening or benign prostate disease."

According to the news editors, the research concluded: "Caution is required for the implementation of prostate cancer clinical decision rules or prediction models for men in China or other Asian countries with similar genetic and environmental backgrounds."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.juro.2016.08.103. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Atrial Fibrillation

Studies from Second University of Naples Describe New Findings in Atrial Fibrillation (The Role of the Atrial Electromechanical Delay in Predicting Atrial Fibrillation in Myotonic Dystrophy Type 1 Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Atrial Fibrillation have been published. According to news reporting originating in Naples, Italy, by NewsRx journalists, research stated, "Paroxysmal atrial tachyarrhythmias frequently occur in myotonic dystrophy type 1 (DM1) patients. The aim of the current study was to evaluate the atrial electromechanical-delay (AEMD) in a DM1-population with normal cardiac function and its relationship to atrial fibrillation (AF) onset."

The news reporters obtained a quote from the research from the Second University of Naples, "Fifty DM1 patients (28 male; mean age 34.2 ? 11.4 years) and 50 healthy subjects used as controls, matched for age and gender, were studied for the occurrence of atrial fibrillation during a 4-year follow-up, through 30-day external loop recorder (ELR) monitoring performed every 6 months. Intra-AEMD and inter-AEMD of both atrium were measured through tissue-Doppler echocardiography. Compared to the healthy control group, the DM1 group showed a statistically significant increase in inter-AEMD and intraleft-AEMD. Dividing the DM1-group into 2 subgroups (patients with or without AF), the inter-AEMD and intraleft-AEMD were significantly higher in the subgroup with AF compared to the subgroup without AF. A cut off value of 39.2 milliseconds for intraleft-AEMD had a sensitivity of 90% and a specificity of 90% in identifying DM1 patients with AF risk. A cut off value of 57.7 milliseconds for inter-AEMD had a sensitivity of 84.2% and a specificity of 93.5% in identifying this category of patients. Our results showed that the echocardiographic atrial electromechanical delay indices (intraleft and inter-AEMD) were significantly increased in DM1 subjects with normal cardiac function."

According to the news reporters, the research concluded: "Intraleft and inter-AEMD represent noninvasive, inexpensive, useful and simple parameters to assess the AF risk in DM1 patients."

Our news correspondents report that additional information may be obtained by contacting V. Russo, Chair of Cardiology, Second University of Naples - Monaldi Hospital, Naples, Italy. Additional authors for this research include A. Rago, C. Ciardiello, M.G. Russo, P. Calabro, L. Politano and G. Nigro.

Studies from Seoul National University Add New Findings in the Area of Spinal Ependymoma (Genetic differences on intracranial versus spinal cord ependymal tumors: a meta-analysis of genetic researches)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nervous System Diseases and Conditions - Spinal Ependymoma. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Although ependymomas occur in both the brain and the spine, the prognosis is quite varied by tumor location. Spinal ependymomas usually follow a relatively benign course with more favorable prognosis than that of the intracranial ependymomas."

Financial support for this research came from National Research Foundation of Korea.

Our news journalists obtained a quote from the research from Seoul National University, "The aim of this study is to evaluate the genetic differences between spinal ependymomas and their intracranial counterparts using a meta-analysis. We searched PubMed, Embase, Web of Science, and the Cochrane library. Comparative or single arm genetic studies that enrolled patients with both intracranial and spinal ependymoma were included. The frequency of genetic aberration was calculated in each group. We calculated the odds ratio (OR) with 95% confidence intervals (CIs) for direct comparative studies and the logit event rate (LER) and 95% CI for single arm studies. Twenty-five studies comprising of 380 spinal ependymomas and 964 intracranial ependymomas were compared to determine the association of the genetic differences of ependymomas at different locations. There were 25 comparable genetic aberrations between spinal and intracranial ependymomas. Among the genes, the NF2 mutation was significantly associated with the spinal ependymomas rather than with the intracranial ependymomas (spinal tumor: LER -0.750, 95% CI -1.233 to -0.266, intracranial tumor: LER -3.080, 95% CI -3.983 to -2.177). Intracranial ependymomas were found to be significantly associated with EPB41L3 deletion (OR 0.34; 95% CI 0.14-0.80) and HIC1 methylation (OR 0.12; 95% CI 0.02-0.68). The genetic aberrations of spinal ependymomas are quite different from those of intracranial ependymomas. The difference in prognosis of ependymoma by location may be associated with genetic difference."

According to the news editors, the research concluded: "A more detailed understanding of them may enable the development of targeted therapy and the estimation of prognosis."

For more information on this research see: Genetic differences on intracranial versus spinal cord ependymal tumors: a meta-analysis of genetic researches. European Spine Journal, 2016;25(12):3942-3951. European Spine Journal can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Biological Factors - Biological Toxins

Studies from Seoul National University College of Medicine Add New Findings in the Area of Biological Toxins (Staphylococcal enterotoxin IgE sensitization in late-onset severe eosinophilic asthma in the elderly)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Biological Factors - Biological Toxins. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "Asthma in the elderly (aged (>=) 65 years old) is a significant concern with high morbidity, but the pathophysiology remains unclear particularly in late-onset asthma. Recent studies suggest staphylococcal enterotoxin IgE (SE-IgE) sensitization to be a risk factor for asthma in general populations; however, the associations have not been examined in late-onset elderly asthma."

Financial support for this research came from Ministry of Health and Welfare.

Our news journalists obtained a quote from the research from the Seoul National University College of Medicine, "We aimed to examine the associations of SE-IgE sensitization with late-onset asthma in the elderly, using a database of elderly asthma cohort study. A total of 249 elderly patients with asthma and 98 controls were analysed. At baseline, patients were assessed for demographics, atopy, induced sputum profiles and comorbidities including chronic rhinosinusitis (CRS). Serum total IgE and SE-IgE levels were measured. Asthma severity was assessed on the basis of asthma outcomes during a 12-month follow-up period. At baseline, serum SE-IgE concentrations were significantly higher in patients with asthma than in controls [median 0.16 (interquartile range 0.04-0.53) vs. 0.10 (0.01-0.19), p<0.001]. Elderly asthma patients with high SE-IgE levels had specific characteristics of having more severe asthma, sputum eosinophilia and CRS, compared to those with lower SE-IgE levels. In multivariate logistic regression analyses, the associations between serum SE-IgE concentrations and severe asthma were significant, independently of covariables [SE-IgE-high (>=) 0.35 kU/L) vs. negative (<0.10 kU/L) group: odds ratio 7.47, 95% confidence interval 1.86-30.03, p=0.005]. Multiple correspondence analyses also showed that high serum SE-IgE level had close relationships with severe asthma, CRS and sputum eosinophilia together. This is the first report on the significant associations of SE-IgE sensitization with late-onset asthma in the elderly, particularly severe eosinophilic asthma with CRS comorbidity."

According to the news editors, the research concluded: "Our findings indicate a potential implication of SE in the high morbidity burden of elderly asthma and suggest clues to the pathogenesis of severe late-onset eosinophilic asthma in the elderly."
For more information on this research see: Staphylococcal enterotoxin IgE sensitization in late-onset severe eosinophilic asthma in the elderly. *Clinical & Experimental Allergy*, 2016;46(3):411-21. (Wiley-Blackwell - www.wiley.com; Clinical & Experimental Allergy - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1365-2222)

Our news journalists report that additional information may be obtained by contacting W.J. Song, Dept. of Internal Medicine, Seoul National University College of Medicine, Seoul, South Korea. **Myeloid Cells**

**Studies from Seoul National University Further Understanding of Myeloid Cells (GM-CSF Grown Bone Marrow Derived Cells Are Composed of Phenotypically Different Dendritic Cells and Macrophages)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Myeloid Cells. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Granulocyte-macrophage colony stimulating factor (GM-CSF) has a role in inducing emergency hematopoiesis upon exposure to inflammatory stimuli. Although GM-CSF generated murine bone marrow derived cells have been widely used as macrophages or dendritic cells in research, the exact characteristics of each cell population have not yet been defined."

Our news editors obtained a quote from the research from Seoul National University, "Here we discriminated GM-CSF grown bone marrow derived macrophages (GM-BMMs) from dendritic cells (GM-BMDCs) in several criteria. After C57BL/6J mice bone marrow cell culture for 7 days with GM-CSF supplementation, two main populations were observed in the attached cells based on MHCII and F4/80 marker expressions. GM-BMMs had MHCII(low)F4/80(high) as well as CD11c(+)CD11b(high)CD80(-)CD64(+)+MerTK(+) phenotypes. In contrast, GM-BMDCs had MHCII(high)F4/80(low) and CD11c(high)CD8 alpha(-)CD11b(+)CD80(+)CD64(-)MerTK(low) phenotypes. Interestingly, the GM-BMM population increased but GM-BMDCs decreased in a GM-CSF dose-dependent manner. Functionally, GM-BMMs showed extremely high phagocytic abilities and produced higher IL-10 upon LPS stimulation. GM-BMDCs, however, could not phagocytose as well, but were efficient at producing TNF alpha, IL-1 beta, IL-12p70 and IL-6 as well as inducing T cell proliferation. Finally, whole transcriptome analysis
revealed that GM-BMMs and GM-BMDCs are overlap with in vivo resident macrophages and dendritic cells, respectively."

According to the news editors, the research concluded: "Taken together, our study shows the heterogeneity of GM-CSF derived cell populations, and specifically characterizes GM-CSF derived macrophages compared to dendritic cells."

The news editors report that additional information may be obtained by contacting S.H. Seok, Seoul National University, Coll Med, Dept. of Microbiol & Immunol, Seoul 03080, South Korea. Additional authors for this research include D. Jung, G.J. Gu and S.H. Seok.

Keywords for this news article include: Seoul, South Korea, Asia, Mononuclear Phagocyte System, Antigen-Presenting Cells, Connective Tissue Cells, Dendritic Cells, Immune System, Bone Research, Myeloid Cells, Bone Marrow, Macrophages, Immunology, Phagocytes, Seoul National University.

**Chemistry - Biochemistry**

**Studies from Seoul National University in the Area of Biochemistry Described (Differentially expressed genes in iron-induced prion protein conversion)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Chemistry - Biochemistry is the subject of a report. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "The conversion of the cellular prion protein (PrPC) to the protease-resistant isoform is the key event in chronic neurodegenerative diseases, including transmissible spongiform encephalopathies (TSEs). Increased iron in prion-related disease has been observed due to the prion protein-ferritin complex."

Funders for this research include Korea Centers for Disease Control & Prevention, Ministry of Health and Welfare, South Korea, Research Institute for Veterinary Science, College of Veterinary Medicine, Seoul National University.

Our news journalists obtained a quote from the research from Seoul National University, "Additionally, the accumulation and conversion of recombinant PrP (rPrP) is specifically derived from Fe(III) but not Fe(II). Fe(III)-mediated PK-resistant PrP (PrPres) conversion occurs within a complex cellular environment rather than via direct contact between rPrP and Fe(III). In this study, differentially expressed genes correlated with prion degeneration by Fe(III) were identified using Affymetrix micro arrays. Following Fe(III) treatment, 97 genes were differentially expressed, including 85 upregulated genes and 12 downregulated genes (>= 1.5-fold change in expression). However, Fe(II) treatment produced moderate alterations in gene expression without inducing dramatic alterations in gene expression profiles. Moreover, functional grouping of identified genes indicated that the differentially regulated genes were
highly associated with cell growth, cell maintenance, and intra- and extracellular transport. These findings showed that Fe(III) may influence the expression of genes involved in PrP folding by redox mechanisms."

According to the news editors, the research concluded: "The identification of genes with altered expression patterns in neural cells may provide insights into PrP conversion mechanisms during the development and progression of prion-related diseases."

For more information on this research see: Differentially expressed genes in iron-induced prion protein conversion. *Biochemical and Biophysical Research Communications*, 2016;480(4):734-740. *Biochemical and Biophysical Research Communications* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. ### Enzymes and Coenzymes

**Studies from Shaanxi University of Technology Describe New Findings in Enzymes and Coenzymes** [Echinacoside and Cistanche tubulosa (Schenk) R. wight ameliorate bisphenol A-induced testicular and sperm damage in rats through gonad axis regulated ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Enzymes and Coenzymes. According to news reporting originating from Shaanxi, People's Republic of China, by NewsRx correspondents, research stated, "Ethnopharmacological relevance: Male infertility has been increasing over the last decades and being a pressing health problem nowadays. Cistanche tubulosa (CT) is a traditional Chinese medicine used to boost male sexual function."

Financial supporters for this research include Shaanxi Collaborative Innovation Center, State Administration of Foreign Experts Affairs, Key Construction Program of International Cooperation Base in S&T.

Our news editors obtained a quote from the research from the Shaanxi University of Technology, "Echinacoside (ECH) is one of the major compounds exist in CT and might be a potential agent to protect testis and sperm injury. Aim of the study: To investigate the mechanisms behind the possible protective effects of CT and ECH against testicular and sperm toxicity. CT was identified by 5.8 s gene sequencing. The major compositions (echinacoside and acteoside) of CT were quantified by HPLC method. The adult male Sprague-Dawley rats were exposed to BPA, CT or ECH for 42 consecutive days. The sperm parameters were observed by..."
dark-field microscope; serum hormone levels (FSH, LH and testosterone) were tested by radio immunoassay; LDH-x activity were evaluated using commercial kits; the expressions of the key steroidogenic enzymes were evaluated by qRT-PCR, heat map, immunofluorescence and western blot. The CT and ECH treatments against BPA-induced testicular and sperm toxicity showed that CT and ECH have reversed BPA-induced abnormality in sperm characteristics, testicular structure and normalized serum testosterone. This was concomitant with the increased expression of LDH-x as well as the key steroidogenic enzymes including StAR, CYP11A1, 3 beta-HSD, 17 beta-HSD and CYP17A1, suggesting that CT and ECH enhanced testosterone biosynthesis."

According to the news editors, the research concluded: "CT and ECH attenuated poor sperm quality and testicular toxicity in rats through up-regulation steroidogenesis enzymes and ECH is the active compound of CT as a potential natural reproductive agent."

The news editors report that additional information may be obtained by contacting X.Y. Zhang, Shaanxi Univ Technol, Coll Biol Sci & Engn, Chinese German Joint Lab Nat Prod Res Qinling Bas, Hanzhong 723000, Shaanxi, People's Republic of China. Eye Diseases and Conditions - Age-Related Macular...

Studies from Shaheed Beheshti University of Medical Sciences Have Provided New Information about Age-Related Macular Degeneration (Evaluation of CC-cytokine ligand 2 and complementary factor H Y402H polymorphisms and their interactional ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Eye Diseases and Conditions - Age-Related Macular Degeneration have been presented. According to news reporting from Tehran, Iran, by NewsRx journalists, research stated, "PurposeTo evaluate the association of CC-cytokine ligand 2 CCL2-2518 (rs1024611) single nucleotide polymorphism, complement factor H (CFH Y402H) and their possible interaction in developing advanced age-related macular degeneration (AMD). MethodsIn this case-control study, DNA samples from 266 patients with advanced AMD and 229 healthy controls were genotyped for CCL2 polymorphism and also 254 patients and 164 healthy controls were genotyped for CFH polymorphism."

The news correspondents obtained a quote from the research from the Shaheed
Beheshti University of Medical Sciences, "The possible associations of these polymorphisms with susceptibility to AMD independently and in different joint combinations were evaluated. Results: The genotype frequency for CFH was found to be significantly different between AMD and normal controls (31.5% versus 20.7%, OR=3.56, p<0.001 for CC and 52.4% versus 41.5%, OR=2.96, p<0.001 for CT genotype). However, no significant association between CCL2 polymorphism and AMD was observed in this cohort (OR=1.15 and OR=0.8, p=0.172). Interestingly, studying the joint effects of two genotypes (TT genotype of CFH Y402H and AG genotype of CCL2-2518) showed more significant protective effect against AMD (p=0.0001), while the risk effect of CC and CT genotypes of CFH was only visible in the presence of AA genotype of CCL2-2518 (p=0.044 and p=0.05). Conclusion: Complement factor H Y402H polymorphism is strongly associated with advanced type AMD. Although this study revealed no association of CCL2-2518 with AMD, the risk effect of CFH genotypes was only visible in the presence of AA genotype of CCL2-2518.

According to the news reporters, the research concluded: "AG genotype of CCL2-2518 in combination with TT genotype of CFH Y402H showed significant protective effect against AMD."

Hematologic Diseases and Conditions...

Studies from Shandong University Describe New Findings in Thrombocytopenia (Participation of B-cell-activating factor receptors in the pathogenesis of immune thrombocytopenia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hematologic Diseases and Conditions -
Thrombocytopenia have been published. According to news reporting out of Shandong, People's Republic of China, by NewsRx editors, research stated, "ESSENTIALS: Dysfunctional B-cell-activating factor (BAFF) system is related to many autoimmune diseases. The regulatory functions of BAFF/BAFF receptors were investigated in an in vitro coculture system."

Funders for this research include Tai Shan Scholar Foundation, Clinical Medicine Center Foundation of Shandong Province, Leading Medical Professionals Foundation of Shandong Province, National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Shandong University, "Different regulatory roles of BAFF were investigated via different receptors in immune thrombocytopenia. The upregulated BAFF receptors on autoreactive lymphocytes lead to their hypersensitivity to BAFF. The pathogenesis of immune thrombocytopenia (ITP) remains enigmatic. B-cell-activating factor (BAFF) and its receptors (BAFF receptor [BAFF-R], transmembrane activator and calcium modulator and cyclophilin ligand interactor [TACI], and B-cell maturation antigen) play central roles in the integrated homeostatic regulation of lymphocytes. To investigate the pathologic roles of BAFF receptors in regulating the bioactivities of lymphocytes in ITP. An in vitro culture system was established by stimulating CD14(-) peripheral lymphocytes with platelet-preloaded dendritic cells in the presence of recombinant human BAFF (rhBAFF; 20 ng mL(-1)). The functions of BAFF receptors were specifically blocked with blocking antibodies. BAFF-R, besides prolonging the survival of B cells in both patients and healthy controls, prominently promoted the survival of CD8(+) T cells and the proliferation of B cells in patients with ITP. TACI, as a positive regulator, not only promoted the proliferation of CD4(+) and CD8(+) T cells, but also significantly enhanced the secretion of interleukin-4 in patients with ITP, but not in controls. Besides revealing the pathologic roles of BAFF receptors, these results also indicate that lymphocytes of patients with ITP have enhanced antiapoptotic or proliferative capacity as compared with those from healthy controls when exposed under similar stimulation of rhBAFF. Further study demonstrated that activated autoreactive B cells and CD4(+) T cells from patients with ITP showed significantly higher expression of BAFF-R or TACI than those from healthy controls. Both BAFF-R and TACI are pathogenic participants in ITP."

According to the news editors, the research concluded: "Their dysregulated expression in patients with ITP may lead to hyperreactivity of activated autoreactive lymphocytes in response to rhBAFF, and thus is highly significant in the pathogenesis of ITP."

Our news journalists report that additional information may be obtained by contacting Y.N. Min, Hematology Oncology Center, Qilu Hospital, Shandong University, Jinan, Shandong, People's Republic of China. Additional authors for this research include C.Y. Wang, X.X. Li, Y. Hou, J.H. Qiu, J. Ma, L.L. Shao, X. Zhang, Y.W. Wang, J. Peng, M. Hou and Y. Shi.

Oncology - Kidney Cancer

Studies from Shandong University Have Provided New Data on Kidney Cancer (Silencing Livin induces apoptotic and autophagic cell death, increasing chemotherapeutic sensitivity to cisplatin of renal carcinoma cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Kidney Cancer. According to news reporting originating from Jinan, People's Republic of China, by NewsRx correspondents, research stated, "Renal cell carcinoma (RCC) accounts for 3% of all adult malignancies and is the most lethal urological cancer. Livin is a member of the inhibitor of apoptosis protein (IAP) family, which is associated with tumor resistance to radiotherapy and chemotherapy."

Financial supporters for this research include Shandong Key Research and Development Project, Medicine and Healthcare Technology Development Project of Shandong Province, Natural Science Foundation of Shandong Province (CN).

Our news editors obtained a quote from the research from Shandong University, "Clinical data also showed that patients with high tumor grades and stages have higher expression levels of Livin in RCC cells. Autophagy is a survival mechanism activated in response to nutrient deprivation. A possible role of Livin in the autophagy of RCC cells has not been investigated; therefore, this pioneer study was carried out. Livin was silenced in RCC cells (slow virus infection [SVI]-shLivin cells) by lentiviral transfection. Then, mRNA and protein expression levels in the transfected cells were assessed by quantitative fluorescence PCR and Western blotting, respectively. In addition, acridine orange staining and electron microscopy were used to assess autophagy in SVI-shLivin cells. The cisplatin IC50 values for RCC cells were measured by the CCK8 assay. Potent antitumor activities were observed in xenograft mouse models generated with Livin-silenced RCC cells in terms of delayed tumor onset and suppressed tumor growth. These results suggested that Livin silencing could increase the chemotherapeutic sensitivity of RCC cells to cisplatin and induce autophagic cell death. A possible mechanism of Bcl-2 and Akt pathway involvement was discussed specifically in this study."

According to the news editors, the research concluded: "Overall, Livin silencing induces apoptotic and autophagic cell death and increases chemotherapeutic sensitivity of RCC cells to cisplatin."

For more information on this research see: Silencing Livin induces apoptotic and autophagic cell death, increasing chemotherapeutic sensitivity to cisplatin of renal carcinoma cells. *Tumor Biology*, 2016;37(11):15133-15143. **Oncology - Thyroid Cancer**

Studies from Shanghai Jiao-Tong University Affiliated Sixth People's Hospital Yield New Data on Thyroid Cancer (Short-Term Side Effects after Radioiodine Treatment in Patients with Differentiated Thyroid Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Thyroid Cancer. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "I-131 therapy for differentiated thyroid cancer (DTC) could induce adverse effects. The purpose of this study was to report and analyze symptoms after I-131 treatment within the hospitalization and present relevant medical intervention."

The news correspondents obtained a quote from the research from Shanghai Jiao-Tong University Affiliated Sixth People's Hospital, "I-131 doses ranging from 3.7 to 9.25 GBq (100-250 mCi) were administrated for thyroid remnant ablation or treating DTC metastases. 117 patients with DTC for I-131 therapy were monitored through the video and intercommunicating with standardized questionnaire at different time points after I-131 oral administration. Adverse effects were recorded and relevant clinical factors were analyzed. Among all the 117 patients, 55 cases complained of neck's pain or swelling and 79 cases presented with gastrointestinal symptoms. Pain or swelling of salivary gland occurred in 15 patients, headache and vertigo in 10, insomnia in 9, vocal cord paralysis in 6, fatigue or general malaise in 6, and foreign body sensation in 5. Body numbness and urinary symptoms were observed in only 1 case, respectively. Those side effects were related with sex, pre-I-131 treatment TSH levels, frequency of I-131 therapy, and lymph node metastases."

According to the news reporters, the research concluded: "Short-term side effects after I-131 therapy for DTC patients varied individually; severe symptoms were not uncommon but generally did not need emergent medical intervention."

For more information on this research see: Short-Term Side Effects after Radioiodine Treatment in Patients with Differentiated Thyroid Cancer. Biomed Research International, 2016;2016():4376720.

Our news journalists report that additional information may be obtained by contacting L. **Cardiovascular Diseases and Conditions --**

**Studies from Shanghai Jiao-Tong University Describe New Findings in Atherosclerosis (miRNA-27b modulates endothelial cell angiogenesis by directly targeting Naa15 in atherogenesis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Atherosclerosis are presented in a new report. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "The CCL20/CCR6 axis has been shown to play a vital role in the pathogenesis of atherosclerosis (AS). However, the regulatory mechanism remains unclear."

The news reporters obtained a quote from the research from Shanghai Jiao-Tong University, "Here, we studied the miRNA-mediated epigenetic regulation of the CCL20/CCR6 axis in atherogenesis. CCR6(+/+)ApoE(-/-) and CCR6(-/-)ApoE(-/-) mice were fed a high-fat diet for 24 weeks. Plaque size was evaluated via ultrasound biomicroscope and hematoxylin and eosin. Protein expression were measured by Western blotting or immunofluorescence/immunohistochemistry or ELISA, and gene mRNA levels were detected by RT-PCR. Seven hundred and sixty miRNAs were screened via miRNA profiling. miRNA-27b target genes were predicted using software and verified with a dual luciferase reporter assay. The tube formation of mouse aortic endothelial cells (MAECs) was performed on Matrigel. In contrast to wild-type ApoE(-/-) mice, CCR6 deficiency led to a significantly decreased plaque size, CD31, CCR6, CCL20 expression and number of CCL20(+) macrophages in atherosclerotic plaques. Stimulation of mouse primary peritoneal macrophages (MPPMs) resulted in increased IL-23 release. miRNA-27b was the most highly expressed (5.19-fold increase) miRNA among the 760 miRNAs screened in the vessel. Naa15 was verified as miRNA-27b target gene, which was diminished in the plaques. Transfection of siRNA Naa15 or miRNA-27b mimic into MAECs caused an increase tube formation. CCR6 deletion effectively ameliorates atherosclerosis progression by reducing macrophage accumulation, resulting in reduced secretion of CCL20 and IL-23."

According to the news reporters, the research concluded: "Mechanistically, the decreased miRNA-27b regulates the activity of the CCL20/CCR6 axis by targeting Naa15, and promotes plaque stability in atherosclerosis."

For more information on this research see: miRNA-27b modulates endothelial cell angiogenesis by directly targeting Naa15 in atherogenesis. *Atherosclerosis*, 2016;254():184-192. *Atherosclerosis* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Oncology - Breast Cancer

Studies from Shanghai Jiao-Tong University Describe New Findings in Breast Cancer (Down-Regulation of Protein Kinase C-epsilon by Prolonged Incubation with PMA Inhibits the Proliferation of Vascular Smooth Muscle Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Phorbol myristate acetate (PMA) exerts a pleiotropic effect on the growth and differentiation of various cells. Protein kinase Cs (PKCs) plays a central role in mediating the effects of PMA on cells."

Our news journalists obtained a quote from the research from Shanghai Jiao-Tong University, "The present study investigated whether the down-regulation of protein kinase C-epsilon (PKC-epsilon) is involved in the inhibition of vascular smooth muscle cell (VSMC) proliferation caused by prolonged PMA incubation. Using cell counting, Cell Counting Kit-8 (CCK-8) and EdU incorporation assay on VSMCs, we evaluated the inhibitory effects of prolonged incubation of PMA, of lentiviruses carrying the short-hairpin RNAs (shRNA) of PKC-epsilon and of the PKC-epsilon inhibitor peptide on the proliferation and viability of cells. The effect of PKC-epsilon down-regulation on growth of rat breast cancer SHZ-88 cells was also measured. The prolonged incubation of VSMCs with PMA for up to 72 hours resulted in attenuated cell growth rates in a time-dependent manner. The expression of PKC-epsilon, as assessed by Western blotting, was also decreased accordingly. Notably, the number of EdU-positive cells and the cell viability of VSMCs were decreased by shRNA of PKC-epsilon and the PKC-epsilon inhibitor peptide, respectively. The proliferation of rat breast cancer SHZ-88 cells was also attenuated by lentivirus-induced shRNA silencing of PKC-epsilon. Prolonged incubation of PMA can inhibit the expression of PKC-epsilon. The effect results in the inhibition of VSMC proliferation."

According to the news editors, the research concluded: "PKC-epsilon silencing can also attenuate breast cancer cell growth, suggesting that PKC-epsilon may be a potential target for anti-cancer drugs."

For more information on this research see: Down-Regulation of Protein Kinase C-epsilon by Prolonged Incubation with PMA Inhibits the Proliferation of Vascular Smooth Cell...

The news correspondents report that additional information may be obtained from L. Wang, Shanghai Jiao Tong University, Affiliated Shanghai Peoples Hosp 6, Dept. of Anesthesiol, Shanghai 200233, People's Republic of China. Additional authors for this research include Y. Wang, Q.H. Zhou, B. Wu, A.Z. Wang, W. Jiang and L. Wang.

**Gram-Positive Bacteria - Streptomyces**

**Studies from Shanghai Jiao-Tong University Have Provided New Data on Streptomyces (Deciphering the streamlined genome of Streptomyces xiamenensis 318 as the producer of the anti-fibrotic drug candidate xiamenmycin)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Positive Bacteria - Streptomyces have been published. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Streptomyces xiamenensis 318, a moderate halophile isolated from a mangrove sediment, produces the anti-fibrotic compound xiamenmycin. The whole genome sequence of strain 318 was obtained through long-read single-molecule real-time (SMRT) sequencing, high-throughput Illumina HiSeq and 454 pyrosequencing technologies."

Our news journalists obtained a quote from the research from Shanghai Jiao-Tong University, "The assembled genome comprises a linear chromosome as a single contig of 5,961,401-bp, which is considerably smaller than other reported complete genomes of the genus Streptomyces. Based on the antiSMASH pipeline, a total of 21 gene clusters were predicted to be involved in secondary metabolism. The gene cluster responsible for the biosynthesis of xiamenmycin resides in a strain-specific 61,387-bp genomic island belonging to the left-arm region. A core metabolic network consisting of 104 reactions that supports xiamenmycin biosynthesis was constructed to illustrate the necessary precursors derived from the central metabolic pathway. In accordance with the finding of a putative ikarugamycin gene cluster in the genome, the targeted chemical profiling of polycyclic tetramate macrolactams (PTMs) resulted in the identification of ikarugamycin."

According to the news editors, the research concluded: "A successful genome mining for bioactive molecules with different skeletons suggests that the naturally minimized genome of S. xiamenensis 318 could be used as a blueprint for constructing a chassis cell with versatile biosynthetic capabilities for the production of secondary metabolites."

For more information on this research see: Deciphering the streamlined genome of Streptomyces xiamenensis 318 as the producer of the anti-fibrotic drug candidate xiamenmycin. *Scientific Reports*, 2016;6():18977. (Nature Publishing Group - www.nature.com/; Scientific

Apoptosis

Studies from Shanghai Jiao-Tong University Reveal New Findings on Apoptosis (Enhancement of triptolide-loaded micelles on tumorigenicity inhibition of human ovarian cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Apoptosis is now available. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Triptolide (TP), a diterpenoid obtained from Tripterygium wilfordii Hook.f, has shown its antitumor activities against a variety of cancers in vitro in recent years. Unfortunately, TP has a small margin between the therapeutic and toxic doses and shows serious toxicity which limits its uses in antitumor treatment."

Financial supporters for this research include National Natural Science Foundation of China, Shanghai Municipal Science and Technology Commission.

Our news editors obtained a quote from the research from Shanghai Jiao-Tong University, "In our previous study, Triptolide-loaded micelles (TP micelles), a TP drug delivery system with a sustained release behavior, had been reported to decrease TP uptake in the liver to relieve its toxicity, and increase TP distribution in the ovary to enhance its effects. This work therefore aimed at evaluating the inhibitory ability of TP micelles in the proliferation, apoptosis, invasion, and migration, and compared with free TP in SKOV3 cells. Our results showed that TP micelles inhibited the proliferation of SKOV3 in a time-and dose-dependent manner, and exhibited enhanced inhibition following 48 and 72?h treatment compared to TP. Cell cycle analysis revealed that TP and TP micelles inhibited cell proliferation by blocking their progression from the G2/M phase to the S phase. Although TP induced a significant increase in cell apoptosis, TP micelles showed a superior effect following 48 and 72?h treatment. Induction of caspase-dependent way and inhibition of NF-kB activation were found to be involved in the mechanism of TP micelles-induced apoptosis. Furthermore, the wound healing assay and transwell assay showed that both TP and TP micelles could obviously inhibit SKOV3 cells migration and invasion. Overall, TP micelles exhibited enhanced therapeutic efficacy in ovarian cancer in vitro due to its prolonged release and redistribution compared with the free TP."

According to the news editors, the research concluded: "TP micelles might lead to an
increase in tumorigenicity inhibition and a decrease in resistance and incidence simultaneously, indicating that it offers a new strategy with promising characteristics for TP chemotherapy application for ovarian cancer.”

The news editors report that additional information may be obtained by contacting Y. Wang, b Dept. of Obstetrics and Gynecology, Renji Hospital, School of Medicine, Shanghai Jiao Tong University, Shanghai 200001, People's Republic of China. Additional authors for this research include T. Liu and H. Li.

**Peptides - Glycopeptides**

**Studies from Shanghai Jiao-Tong University School of Medicine Further Understanding of Glycopeptides (Pre-Treatment Serum C-Reactive Protein Level Is An Independent Risk Factor for Development of Nephrotoxicity in Patients Receiving High-Dose ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Peptides - Glycopeptides. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "High-dose vancomycin treatment increases the likelihood of vancomycin-related nephrotoxicity. C-reactive protein (CRP) is a sensitive marker of systemic inflammation."

The news reporters obtained a quote from the research from the Shanghai Jiao-Tong University School of Medicine, "In this study, we evaluated the pre-treatment serum CRP level as a risk factor of the development of nephrotoxicity in patients receiving high total daily doses (>2.5 g) of vancomycin. Data extracted from medical records for 174 patients who received total daily doses of >2.5 g of intravenous vancomycin for a minimum of 48 h and had their serum CRP level and erythrocyte sedimentation rate tested within 24 h before vancomycin treatment were subject to final analyses. Univariate analyses showed that patients who developed nephrotoxicity during vancomycin treatment had significantly higher median vancomycin serum concentration, duration of vancomycin treatment, and the serum CRP level within 24 h before vancomycin treatment than the non-nephrotoxicity group. Multivariate logistic regression analysis showed that after adjustment for potential confounders, median vancomycin serum concentration, duration of treatment, serum CRP level within 24 h before vancomycin treatment, and nephrotoxic medication were found significantly associated with the development of nephrotoxicity. This was confirmed by multivariate hazard ratio analysis after adjustment for potential confounders."

According to the news reporters, the research concluded: "This study provides the
first evidence supporting the fact that the serum CRP level within 24 h before vancomycin treatment is an independent risk factor for the development of nephrotoxicity in patients receiving total daily doses of >2.5 g of vancomycin. Therefore, the serum CRP level within 24 h before vancomycin treatment could be a potential biomarker or prognostic factor for the development of vancomycin nephrotoxicity.”

Our news correspondents report that additional information may be obtained by contacting J. He, Dept. of Pharmacy, Ruijin Hospital, Shanghai Jiao Tong University School of Medicine, Shanghai, People's Republic of China. Additional authors for this research include E.Q. Mao, F. Jing, H.T. Jiang, W.H. Yang and E.Z. Chen.

Life Science Research - Apoptosis and Cell Death

Studies from Shanghai Jiao-Tong University School of Medicine Yield New Data on Apoptosis and Cell Death (ANP32B deficiency impairs proliferation and suppresses tumor progression by regulating AKT phosphorylation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Life Science Research - Apoptosis and Cell Death have been presented. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "The acidic leucine-rich nuclear phosphoprotein 32B (ANP32B) is reported to impact normal development, with Anp32b-knockout mice exhibiting smaller size and premature aging. However, its cellular and molecular mechanisms, especially its potential roles in tumorigenesis, remain largely unclear."

Our news journalists obtained a quote from the research from the Shanghai Jiao-Tong University School of Medicine, "Here, we utilize 'knockout' models, RNAi silencing and clinical cohorts to more closely investigate the role of this enigmatic factor in cell proliferation and cancer phenotypes. We report that, compared with Anp32b wild-type (Anp32b(+/+)) littermates, a broad panel of tissues in Anp32b-deficient (Anp32b(-/-)) mice are demonstrated hypoplasia. Anp32b(-/-) mouse embryo fibroblast cell has a slower proliferation, even after oncogenic immortalization. ANP32B knockdown also significantly inhibits in vitro and in vivo growth of cancer cells by inducing G1 arrest. In line with this, ANP32B protein has higher expression in malignant tissues than adjacent normal tissues from a cohort of breast cancer patients, and its expression level positively correlates with their histopathological grades."
Moreover, ANP32B deficiency downregulates AKT phosphorylation, which involves its regulating effect on cell growth."

According to the news editors, the research concluded: "Collectively, our findings suggest that ANP32B is an oncogene and a potential therapeutic target for breast cancer treatment."

For more information on this research see: ANP32B deficiency impairs proliferation and suppresses tumor progression by regulating AKT phosphorylation. *Cell Death & Disease*, 2016;7():e2082. (Nature Publishing Group - www.nature.com/; Cell Death & Disease - www.nature.com/cddis/)

**Mutagenesis**

**Studies from Shanghai Jiao-Tong University Yield New Data on Mutagenesis [Targeted AIDID-mediated mutagenesis (TAM) enables efficient genomic diversification in mammalian cells]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Mutagenesis is the subject of a report. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "A large number of genetic variants have been associated with human diseases. However, the lack of a genetic diversification approach has impeded our ability to interrogate functions of genetic variants in mammalian cells."

Our news journalists obtained a quote from the research from Shanghai Jiao-Tong University, "Current screening methods can only be used to disrupt a gene or alter its expression. Here we report the fusion of activation-induced cytidine deaminase (AID) with nuclease-inactive clustered regularly interspaced short palindromic repeats (CRISPR)-associated protein 9 (dCas9) for efficient genetic diversification, which enabled high-throughput screening of functional variants. Guided by single guide (sg) RNAs, dCas9-AID-P182X (AIDx) directly changed cytidines or guanines to the other three bases independent of AID hotspot motifs, generating a large repertoire of variants at desired loci. Coupled with a uracil-DNA glycosylase inhibitor, dCas9-AIDx converted targeted cytidines specifically to thymines, creating specific point mutations. By targeting BCR-ABL with dCas9-AIDx, we efficiently identified known and new mutations conferring imatinib resistance in chronic myeloid leukemia cells."

According to the news editors, the research concluded: "Thus, targeted AID-
mediated mutagenesis (TAM) provides a forward genetic tool to screen for gain-of-function variants at base resolution."

Our news journalists report that additional information may be obtained by contacting X. Chang, Shanghai Jiao Tong University, Sch Med, Collaborat Innovat Center Syst Biomed, Shanghai, People's Republic of China. Additional authors for this research include J.Y. Zhang, W.J. Yin, Z.C. Zhang, Y. Song and X. Chang.

**Pregnancy Complications - Gestational Diabetes**

**Studies from Shanghai Jiao-Tong University in the Area of Gestational Diabetes Described (Maternal BMI, gestational diabetes, and weight gain in relation to childhood obesity: The mediation effect of placental weight)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pregnancy Complications - Gestational Diabetes have been published. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "High prepregnancy body mass index (BMI), excessive gestational weight gain (GWG), and gestational diabetes mellitus (GDM) are associated with the risk of childhood obesity. This study aims to examine the extent to which these effects may be mediated through the placenta."

Our news editors obtained a quote from the research from Shanghai Jiao-Tong University, "Data included 33,893 mothers and their singleton infants from birth to 7 years old (total 154,590 visits) in the Collaborative Perinatal Project, a U.S. multicenter prospective cohort study from 1959 to 1976. The placenta weight was determined after removing cord and membranes. We performed sequential generalized estimating equation-linear models excluding and including placental weight to evaluate its mediation effect. In this population, 21.7% of mothers had overweight or obesity, 17.3% had excessive GWG, and 350 (1%) had diagnosed GDM; in addition, 7.2% children had obesity. After adjustment for prepregnancy BMI and other covariates, childhood BMI was 0.23 (95% CI: 0.05, 0.40) kg/m(2) higher for children born to mothers with GDM versus those without GDM. Inclusion of placental weight in the model attenuated the association by 52% to 0.11 (95% CI: -0.06, 0.28) and similarly attenuated the associations with childhood BMI for GWG by 25% and maternal prepregnancy BMI by 17%.

According to the news editors, the research concluded: "Placental weight partly mediates the effects of prepregnancy BMI, excessive GWG, and GDM on childhood BMI."

For more information on this research see: Maternal BMI, gestational diabetes, and weight gain in relation to childhood obesity: The mediation effect of placental weight. *Obesity*, 2016;24(4):938-46. (Nature Publishing Group - www.nature.com/; Obesity -

**Studies from Shanghai Jiao-Tong University in the Area of Type 1 Diabetes Mellitus Reported (Vessel Dilation Attenuates Endothelial Dysfunction Following Middle Cerebral Artery Occlusion in Hyperglycemic Rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Type 1 Diabetes Mellitus. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Dynamically observe cerebral vascular changes in hyperglycemic rats in vivo and explore the effect of diabetes on endothelial function after ischemic stroke. Diabetes affects both large and small vessels in the brain, but the dynamic process and mechanism are unclear."

Financial supporters for this research include National Natural Science Foundation of China, Shanghai Committee of Science and Technology.

The news reporters obtained a quote from the research from Shanghai Jiao-Tong University. "We investigated the structural and functional changes of brain vasculature in living hyperglycemic rats and their impact on stroke outcomes via a novel technique: synchrotron radiation angiography. We also examined the effect of prolonged fasudil treatment on arterial reactivity and hemorrhagic transformation. Adult Sprague Dawley rats were treated by streptozotocin to induce type 1 diabetes. These hyperglycemic rats received fasudil pretreatment and then underwent transient middle cerebral artery occlusion. We found that diabetes caused arteries narrowing in the circus Willis as early as 2 weeks after streptozotocin injection (p <0.05). These vessels were further constricted after middle cerebral artery occlusion. L-NAME could induce regional constrictions and impaired relaxation in hyperglycemic animals. Furthermore, hemorrhagic transformation was also increased in the hyperglycemic rats compared to the control (p <0.05). In fasudil-treated rats, the internal carotid artery narrowing was ameliorated and L-NAME-induced regional constriction was abolished. Importantly, stroke prognosis was improved in fasudil-treated rats compared to the control (p <0.05). Our dynamic angiographic data demonstrated that diabetes could impair the cerebral arterial reactivity."

According to the news reporters, the research concluded: "Prolonged fasudil
treatment could attenuate arterial dysfunction and improve the prognosis of ischemic stroke by affecting both the large and small vasculature."

For more information on this research see: Vessel Dilation Attenuates Endothelial Dysfunction Following Middle Cerebral Artery Occlusion in Hyperglycemic Rats. *Cns Neuroscience & Therapeutics*, 2016;22(4):316-24. *Cns Neuroscience & Therapeutics* can be contacted at: Blackwell Publishing Inc, 350 Main St, Malden, MA 02148, USA. **Enzymes and Coenzymes - Cysteine Endopeptidases**

**Studies from Shanghai University of Traditional Chinese Medicine Provide New Data on Cysteine Endopeptidases (Antiapoptotic effect of exercise training on ovariectomized rat hearts)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Enzymes and Coenzymes - Cysteine Endopeptidases have been published. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "The purpose of this study was to evaluate the effects of exercise training on cardiac Fas receptor-dependent and mitochondria-dependent apoptotic pathways in ovariectomized rats. Histopathological analysis, TUNEL assay, and Western blotting were performed on the excised hearts from three groups of Sprague-Dawley rats, which were divided into a sham-operated group, a bilaterally ovariectomized group (OVX), and a bilaterally ovariectomized group that underwent treadmill running exercise for 60 min/day, 5 sessions/wk, for 10 wk (OVX-EX)."

The news reporters obtained a quote from the research from the Shanghai University of Traditional Chinese Medicine, "The abnormal myocardial architecture, cardiac trichome-stained fibrosis and cardiac TUNEL-positive apoptotic cells in ovariectomized rats improved after exercise training. The protein levels of tumor necrosis factor-alpha, tumor necrosis factor receptor 1, Fas ligand, Fas receptors, Fas-associated death domain, activated caspase-8 and activated caspase-3 (Fas receptor-dependent apoptotic pathways), as well as t-Bid, Bad, Bak, Bax, cytosolic cytochrome c, activated caspase-9, and activated caspase-3 (mitochondria-dependent apoptotic pathways) were decreased in the OVX-EX group compared with the OVX
group. Exercise training suppressed ovariectomy-induced cardiac Fas receptor-dependent and mitochondria-dependent apoptotic pathways in ovariectomized rat models.

According to the news reporters, the research concluded: "These findings might indicate a new therapeutic effect for exercise training to prevent cardiac apoptosis in menopausal or bilaterally oophorectomized women."

**Pentanoic Acids**

**Studies from Shengjing Hospital Yield New Information about Pentanoic Acids (Development and Validation of a Simple and Rapid UPLC-MS Assay for Valproic Acid and Its Comparison With Immunoassay and HPLC Methods)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Pentanoic Acids. According to news reporting originating from Shenyang, People's Republic of China, by NewsRx correspondents, research stated, "Valproic acid (VPA), a widely used antiepileptic drug, has a narrow therapeutic range of 50-100 mcg/mL and shows large individual variability. It is very important to monitor the trough concentration of VPA using a reliable method."

Our news editors obtained a quote from the research from Shengjing Hospital, "Therefore, the aim of this study was to develop and validate a rapid ultraperformance liquid chromatographic-mass spectrometry (UPLC-MS) method for quantification of VPA in human serum and to compare with fluorescence polarization immunoassay (FPIA), chemiluminescence microparticle immunoassay (CMIA), and high-performance liquid chromatography (HPLC) methods. The method included extraction of VPA in serum by deproteination with acetonitrile. The analysis was performed using an EC-C18 column (2.7 mm, 4.6 ? 50 mm) under isocratic conditions with a mobile phase of acetonitrile/water (containing 0.1% formic acid) (45/55, vol/vol) at a flow rate of 0.6 mL/min. The detection was performed on a triple-quadrupole tandem mass spectrometer using an electrospray probe in the negative ionization mode. The method was validated by studies of selectivity, linearity, lower limit of
quantification, accuracy, precision, recovery, matrix effect, and stability. Furthermore, all the 4 methods including FPIA, CMIA, and HPLC were subsequently used to assay the VPA concentration in 498 clinical serum samples collected from patients who received VPA. These methods were compared by Deming regression and Bland-Altman analysis. The retention time of VPA was 2.09 minutes. The calibration curve was linear over the concentration range of 1-200 mcg/mL, with a lower limit of quantification of 1 mcg/mL. The interday and intraday precision (RSD %) was less than 4.6% and 4.5%, respectively, and the accuracy (RE %) was below 7.9%. The recoveries and matrix effect of VPA at concentrations of 2, 50, and 160 mcg/mL met the requirement for the analysis of biological samples. No obvious degradation of VPA was observed under various storage conditions including room temperature for 12 hour, 3 freeze-thaw cycles, and -20?C for 3 months. Regression analysis showed that the correlation coefficients for the UPLC-MS versus FPIA, CMIA, and HPLC were 0.989, 0.988, and 0.987, respectively. The results of agreement tests between UPLC-MS and other methods showed that the mean difference of UPLC-MS and FPIA was -1.4 mcg/mL and 95% confidence interval of -7.7 to 4.9 mcg/mL, and the values for UPLC-MS and CMIA were -0.8 mcg/mL and -7.5 to 5.8 mcg/mL, for UPLC-MS and HPLC were 1.1 mcg/mL and -5.7 to 7.9 mcg/mL. The rapid UPLC-MS method we developed showed a good analytical performance required for therapeutic drug monitoring, leading to potential improvements in patient care and laboratory management.

According to the news editors, the research concluded: "Compared with the FPIA, CMIA, and HPLC methods, the UPLC-MS method correlated well and displayed comparable VPA concentrations."

For more information on this research see: Development and Validation of a Simple and Rapid UPLC-MS Assay for Valproic Acid and Its Comparison With Immunoassay and HPLC Methods. *Therapeutic Drug Monitoring*, 2016;38(2):246-52. (Lippincott Williams and Wilkins - www.lww.com; Therapeutic Drug Monitoring - journals.lww.com/drug-monitoring/pages/default.aspx)

The news editors report that additional information may be obtained by contacting M. Zhao, Dept. of Pharmacy, Shengjing Hospital of China Medical University, Shenyang, Liaoning Province, People's Republic of China. Additional authors for this research include G. Li, F. Qiu, Y. Sun, Y. Xu and L. Zhao.

report. According to news reporting originating in Otsu, Japan, by NewsRx journalists, research stated, "Eosinophil infiltration is a histological feature of autoimmune pancreatitis (AIP). However, little is known about the mechanisms underlying eosinophilic infiltration."

The news reporters obtained a quote from the research from the Shiga University of Medical Sciences, "In this study, we aimed to investigate the expression of the eosinophil chemotactic protein, eotaxin-3, in human pancreatic myofibroblasts. Enzyme-linked immunosorbent assays and quantitative polymerase chain reactions were used to quantify eotaxin-3 protein and messenger RNA levels, respectively. Eotaxin-3 expression was induced by T helper type 2 cytokines, interleukin-4 (IL-4) and IL-13, in time-and dose-dependent manners. Both IL-4 and IL-13 induced the rapid phosphorylation of STAT6 (signal transducer and activator of transcription 6), and STAT6-specific small interfering RNA significantly blocked IL-4-and IL-13-induced eotaxin-3 expression, indicating involvement of STAT6 signaling pathways in eotaxin-3 induction. In contrast, SOCS (suppressor of cytokine signaling) protein-specific small interfering RNA experiments suggested that the SOCS family proteins are negative regulators of IL-4-and IL-13-induced eotaxin-3 expression in pancreatic myofibroblasts. Interferon-g significantly inhibited IL-4-and IL-13-induced eotaxin-3 expression, and this response was mediated by STAT1 activation. Pancreatic myofibroblasts may be a cellular source of eotaxin-3 in the pancreas."

According to the news reporters, the research concluded: "The T helper type 2 cytokines, IL-4 and IL-13, are critical factors for the induction of eotaxin-3 in the pancreas."

For more information on this research see: Eotaxin-3 (CCL26) Expression in Human Pancreatic Myofibroblasts. Pancreas, 2016;45(3):420-4. (Lippincott Williams and Wilkins - www.lww.com; Pancreas - journals.lww.com/pancreasjournal/pages/default.aspx)

Studies from Sichuan Agricultural University Yield New Information about Chromatography (Simultaneous Determination of beta-Cypermethrin and Its Metabolite 3-Phenoxybenzoic Acid in Microbial Degradation Systems by HPLC-UV)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Science - Chromatography is the subject of a report. According to news reporting originating from Sichuan, People's Republic of China, by NewsRx correspondents, research stated, "The wide use of pesticides in agriculture is necessary to guarantee adequate food production worldwide. However, pesticide residues have caused global..."
Our news editors obtained a quote from the research from Sichuan Agricultural University, "In this study, we could identify beta-cypermethrin (beta-CY) and its degradation product 3-phenoxybenzoic acid (3-PBA) by liquid chromatograph-mass spectrometry. Few studies on the simultaneous determination of beta-CY and its metabolites have been carried out so far; hence, we established a high-performance liquid chromatography method to determine the concentrations of both beta-CY and 3-PBA simultaneously in microbial degradation systems. In this study, a novel beta-CY degrading strain, Bacillus licheniformis B-1, was isolated from a tea garden soil, utilizing beta-CY as a growth substrate. Good linear relationships between beta-CY and 3-PBA were observed and the concentrations of reference solutions were between 0.50 and 60.00 μg/mL. Satisfactory stability and intra-and interday precision were obtained. The limits of detection were 0.06 and 0.13 μg/mL for beta-CY and 3-PBA, respectively, and the corresponding limits of quantification were 0.21 and 0.34 μg/mL, respectively. Spiking recoveries for beta-CY varied from 98.38 to 105.80%, with relative standard deviations (RSDs) varying from 1.49 to 3.93%. Spiking recoveries for 3-PBA varied from 99.59 to 101.20%, with RSDs varying from 0.58 to 3.64%.

According to the news editors, the research concluded: "The proposed method has advantages of simplicity, rapidity, high accuracy, good separation and reproducibility; thus, it is ideally suitable for simultaneous determination of beta-CY and 3-PBA in microbial degradation systems."

Lung Diseases and Conditions - Pulmonary Embolism

Studies from Sichuan University Yield New Data on Pulmonary Embolism (The Efficacy and Safety of Combination of Intravenous and Topical Tranexamic Acid in Revision Hip Arthroplasty: A Randomized, Controlled Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Pulmonary Embolism. According to news reporting from Chengdu, People's Republic of China, by NewsRx journalists, research stated, "Revision total hip arthroplasty (THA) is associated with substantial blood loss and a high probability of blood transfusion in the perioperative
This study aimed to evaluate the efficacy and safety of combination of intravenous (IV) and topical tranexamic acid (TXA) in revision THA."

The news correspondents obtained a quote from the research from Sichuan University, "Eighty-four consecutive patients undergoing revision THA were randomized into combined group and IV-TXA group. Patients in the combined group were given intravenously 15 mg/kg TXA as a preoperative, and topical TXA solution was applied at a concentration of 3 g TXA per 100-mL saline during the different procedure points. Patients in the IV-TXA group were given intravenously 15mg/kg TXA alone. The mean total blood loss, drainage volume, and maximum hemoglobin drop were significantly lower in the combined group than the IV-TXA group (P < .001, P< .001, P<.001, respectively). Compared with the IV-TXA group, the amount of blood transfusions and number of blood transfusions required were decreased dramatically in the combined group (P = .027, P< .001, respectively). One deep vein thrombosis and 4 calf muscular vein thrombosis in the combined group and 3 calf muscular vein thrombosis in the IV-TXA were detected by the Doppler ultrasound. No pulmonary embolism was observed and no significant differences were found in other complications between the 2 groups."

According to the news reporters, the research concluded: "This study showed that combined administration of IV and topical TXA in revision THA can effectively decrease total blood loss and number of blood transfusions required without increasing the risk of deep vein thrombosis or/pulmonary embolism compared with IV-TXA alone."

Our news journalists report that additional information may be obtained by contacting B. Shen, Sichuan University, West China Med Sch, West China Hosp, Dept. of Orthopaed Surg, Chengdu, Sichuan, People's Republic of China. Additional authors for this research include Y. Zeng, T.M. Yang, H.B. Si, F. Cao and B. Shen.

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Hypertension are discussed in a new report. According to news reporting originating from Chengdu, People's Republic of China, by NewsRx correspondents, research stated, "The aim of this study was to assess the prognostic value of hyperuricemia in patients with established hypertension by systematic review and meta-analysis of cohort studies."

Financial support for this research came from National Health and Family Planning Commission of the People's Republic of China.

Our news editors obtained a quote from the research from Sichuan University, "MEDLINE, Embase, and the Chinese Biomedical Literature Database were searched through January 2015. Seventeen cohort studies were included and their methodological quality was moderate to high, with Newcastle-Ottawa Scale scores ranging from 6 to 9. Random-effects model meta-analyses showed that in terms of adjusted categorical data, hyperuricemia significantly correlated with cardiovascular diseases in hypertensive patients (hazard ratio [HR], 1.51; 95% confidence interval [CI], 1.13-2.03), all-cause mortality (HR, 1.12; 95%CI, 1.02-1.23), and diabetes (HR, 1.84; 95% CI, 1.02-3.30) but not with stroke (HR, 0.85; 95%CI, 0.57-1.27); while, in terms of adjusted continuous data, the corresponding pooled HRs were 1.17 (95% CI, 1.07-1.27), 1.05 (95% CI, 0.98-1.13), 1.28 (95% CI, 1.18-1.38), and 1.06 (95% CI, 0.98-1.16), respectively."

According to the news editors, the research concluded: "The findings of our meta-analysis suggest that hyperuricemia could slightly increase the risk of cardiovascular diseases and diabetes in patients with hypertension."

The news editors report that additional information may be obtained by contacting J. Li, Sichuan University, West China Hosp, Dept. of Evidence Based Med & Clin Epidemiol, Chengdu 610041, People's Republic of China. Additional authors for this research include X.Q. Zhou, J. Wang, X.Y. Wu, Y.L. Li, L. Wang, H. Huang and J. Li.

**Immune System Diseases and Conditions - HIV/AIDS**

**Studies from Simon Fraser University in the Area of HIV/AIDS Reported (Prevalence, type, and correlates of trauma exposure among adolescent men and women in Soweto, South Africa: implications for HIV**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immune System Diseases and Conditions - HIV/AIDS is now available. According to news reporting from Burnaby, Canada, by NewsRx journalists, research stated, "Youth trauma exposure is associated with syndemic HIV risk. We measured lifetime prevalence, type, and correlates of trauma experience by gender among adolescents living in the HIV hyper-endemic setting of Soweto, South Africa."

The news correspondents obtained a quote from the research from Simon Fraser University, "Using data from the Botsha Bophelo Adolescent Health Survey (BBAHS), prevalence of 'ever' experiencing a traumatic event among adolescents (aged 14-19) was assessed using a modified Traumatic Event Screening InventoryChild (TESI-C) scale (19 items, study alpha = 0.63). We assessed self-reported number of potentially traumatic events (PTEs) experienced overall and by gender. Gender-stratified multivariable logistic regression models assessed independent correlates of 'high PTE score' (>= 7 PTEs). Overall, 767/830 (92%) participants were included (58% adolescent women). Nearly all (99.7%) reported experiencing at least one PTE. Median PTE was 7 [Q1, Q3: 5-9], with no gender differences (p = 0.19). Adolescent men reported more violent PTEs (e.g., 'seen an act of violence in the community') whereas women reported more nonviolent HIV/AIDS-related PTEs (e.g., 'family member or someone close died of HIV/AIDS'). High PTE score was independently associated with high food insecurity among adolescent men and women (aOR = 2.63, 95% CI = 1.36-5.09; aOR = 2.57, 95% CI = 1.55-4.26, respectively). For men, high PTE score was also associated with older age (aOR = 1.40/year, 95% CI = 1.21-1.63); and recently moving to Soweto (aOR = 2.78, 95% CI = 1.14-6.76). Among women, high PTE score was associated with depression using the CES-D scale (aOR = 2.00, 95% CI = 1.31-3.03, ) and inconsistent condom use vs. no sexual experience (aOR = 2.69, 95% CI = 1.66-4.37). Nearly all adolescents in this study experienced trauma, with gendered differences in PTE types and correlates, but not prevalence. Exposure to PTEs were distributed along social and gendered axes. Among adolescent women, associations with depression and inconsistent condom use suggest pathways for HIV risk."

According to the news reporters, the research concluded: "HIV prevention interventions targeting adolescents must address the syndemics of trauma and HIV through the scale-up of gendertransformative, youth-centred, trauma-informed integrated HIV and mental health services."

Our news journalists report that additional information may be obtained by contacting A. Kaida, Simon Fraser University, Fac Hlth Sci, Burnaby, BC V5A 1S6, Canada. Nutritional and Metabolic Diseases and Conditions...

Studies from Singapore National University Update Current Data on Diabetic Angiopathies (Biomarkers of Diabetic Retinopathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Diabetic Angiopathies are discussed in a new report. According to news reporting originating in Singapore, Singapore, by NewsRx journalists, research stated, "Diabetic retinopathy (DR), a leading cause of acquired vision loss, is a microvascular complication of diabetes. While traditional risk factors for diabetic retinopathy including longer duration of diabetes, poor blood glucose control, and dyslipidemia are helpful in stratifying patient's risk for developing retinopathy, many patients without these traditional risk factors develop DR; furthermore, there are persons with long diabetes duration who do not develop DR."

The news reporters obtained a quote from the research from Singapore National University, "Thus, identifying biomarkers to predict DR or to determine therapeutic response is important. A biomarker can be defined as a characteristic that is objectively measured and evaluated as an indicator of normal biological processes, pathogenic processes, or pharmacologic responses to a therapeutic intervention. Incorporation of biomarkers into risk stratification of persons with diabetes would likely aid in early diagnosis and guide treatment methods for those with DR or with worsening DR. Systemic biomarkers of DR include serum measures including genomic, proteomic, and metabolomics biomarkers. Ocular biomarkers including tears and vitreous and retinal vascular structural changes have also been studied extensively to prognosticate the risk of DR development. The current studies on biomarkers are limited by the need for larger sample sizes, cross-validation in different populations and ethnic groups, and time-efficient and cost-effective analytical techniques."

According to the news reporters, the research concluded: "Future research is important to explore novel DR biomarkers that are non-invasive, rapid, economical, and accurate to help reduce the incidence and progression of DR in people with diabetes."

For more information on this research see: Biomarkers of Diabetic Retinopathy. Current Diabetes Reports, 2016;16(12):65-79. Current Diabetes Reports can be contacted at: Current Medicine Group, 400 Market Street, Ste 700, Philadelphia, PA 19106, USA. Lung Diseases and Conditions - Asthma

Studies from Singapore National University Yield New Data on Asthma (Blomia tropicalis-Specific TCR Transgenic Th2 Cells Induce Inducible BALT and Severe Asthma in Mice by an IL-4/IL-13-Dependent Mechanism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lung Diseases and Conditions - Asthma is the subject of a report. According to news reporting out of Singapore, Singapore, by NewsRx editors, research stated, "Previous studies have highlighted the importance of lung-draining lymph nodes in the respiratory allergic immune response, whereas the lung parenchymal immune system has been largely neglected. We describe a new in vivo model of respiratory sensitization to Blomia tropicalis, the principal asthma allergen in the tropics, in which the immune response is focused on the lung parenchyma by transfer of Th2 cells from a novel TCR transgenic mouse, specific for the major B. tropicalis allergen Blo t 5, that targets the lung rather than the draining lymph nodes."

Our news journalists obtained a quote from the research from Singapore National University, "Transfer of highly polarized transgenic CD4 effector Th2 cells, termed BT-II, followed by repeated inhalation of Blo t 5 expands these cells in the lung > 100-fold, and subsequent Blo t 5 challenge induced decreased body temperature, reduction in movement, and a fall in specific lung compliance unseen in conventional mouse asthma models following a physiological allergen challenge. These mice exhibit lung eosinophilia; smooth muscle cell, collagen, and goblet cell hyperplasia; hyper IgE syndrome; mucus plugging; and extensive inducible BALT. In addition, there is a fall in total lung volume and forced expiratory volume at 100 ms."

According to the news editors, the research concluded: "These pathophysiological changes were substantially reduced and, in some cases, completely abolished by administration of neutralizing mAbs specific for IL-4 and IL-13 on weeks 1, 2, and 3. This IL-4/IL-13-dependent inducible BALT model will be useful for investigating the pathophysiological mechanisms that underlie asthma and the development of more effective drugs for treating severe asthma."

For more information on this research see: Blomia tropicalis-Specific TCR Transgenic Th2 Cells Induce Inducible BALT and Severe Asthma in Mice by an IL-4/IL-13-Dependent Mechanism. Journal of Immunology, 2016;197(10):3771-3781. Journal of Immunology can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. Studies from Soonchunhyang University Reveal New Findings on Amyotrophic Lateral Sclerosis (Imbalance of mitochondrial dynamics in Drosophila models of amyotrophic lateral sclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Amyotrophic Lateral Sclerosis is the subject of a report. According to news reporting originating from Asan, South Korea, by NewsRx correspondents, research stated, "Amyotrophic lateral sclerosis (ALS) is the most common neurodegenerative disease, characterized by progressive and selective loss of motor neurons in the brain and spinal cord. DNA/RNA-binding proteins such as TDP-43, FUS, and TAF15 have been linked with the sporadic and familial forms of ALS."

Financial supporters for this research include Ministry of Education, Soonchunhyang University Research Fund.

Our news editors obtained a quote from the research from Soonchunhyang University, "However, the exact pathogenic mechanism of ALS is still unknown. Recently, we found that ALS-causing genes such as TDP-43, FUS, and TAF15 genetically interact with mitochondrial dynamics regulatory genes. In this study, we show that mitochondrrial fission was highly enhanced in muscles and motor neurons of TDP-43, FUS, and TAF15-induced fly models of ALS. Furthermore, the mitochondrial fission defects were rescued by co-expression of mitochondrial dynamics regulatory genes such as Marf, Opa1, and the dominant negative mutant form of Drp1. Moreover, we found that the expression level of Marf was decreased in ALS-induced flies."

According to the news editors, the research concluded: "These results indicate that the imbalance of mitochondrial dynamics caused by instability of Marf is linked to the pathogenesis of TDP-43, FUS, and TAF15-associated ALS."

For more information on this research see: Imbalance of mitochondrial dynamics in Drosophila models of amyotrophic lateral sclerosis. *Biochemical and Biophysical Research Communications*, 2016;481(3-4):259-264. *Biochemical and Biophysical Research Communications* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Studies from Sophiahemmet University Yield New Information about Clinical Nursing (District nurses' perspectives on detecting mental health problems and promoting mental health among community-dwelling seniors with multimorbidity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nursing - Clinical Nursing are presented in a new report. According to news originating from Stockholm, Sweden, by NewsRx correspondents, research stated, "Aims and objectives. To describe district nurses' perspectives on detecting mental health problems and promoting mental health among homebound older people with multimorbidity."

Financial supporters for this research include National Health Care Science Postgraduate School, Vetenskapsradet, Svenska Sallskapet for Medicinsk Forskning, Karolinska Institutet Research Foundation, Stockholm.

Our news journalists obtained a quote from the research from Sophiahemmet University, "Mental health problems among older people with multiple chronic conditions, that is, multimorbidity, are challenging issues. These patients' homes often serve as arenas in which district nurses can promote health. Mental health promotion must be studied in greater depth within primary care because older people with multimorbidity are particularly prone to developing poor mental health, which can go undetected and untreated. A descriptive, qualitative study using semi-structured interviews and content analysis. Twenty-five district nurses completed individual or focus group interviews. Data were analysed using qualitative content analysis. Most district nurses stated that detecting mental health problems and promoting mental health were important tasks but that they typically focused on more practical home health care tasks. The findings revealed that district nurses focused on assessment, collaboration and social support as means of detecting mental health problems and promoting mental health. The district nurses described various factors and actions that appeared to be important prerequisites for their involvement in primary mental health care. Nevertheless, there were no established goals for mental health promotion, and district nurses often seemed to depend on their collaboration with other actors. Our findings indicated that district nurses cannot bear the primary responsibility for the early detection of mental health problems and early interventions to promote mental health within this population. Relevance to clinical practice. The findings of this study indicated that workforce training and collaboration between different care providers are important elements in the future development of this field."

According to the news editors, the research concluded: "Early detection and early treatment of mental health-related issues should also be stated as explicit objectives in the provision of care to community-dwelling older people with multimorbidity."

For more information on this research see: District nurses' perspectives on detecting mental health problems and promoting mental health among community-dwelling seniors with

**Oncology - Gliomas**

**Studies from Sorbonne University in the Area of Gliomas Described (Seizures and gliomas--towards a single therapeutic approach)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gliomas have been published. According to news reporting originating from Paris, France, by NewsRx correspondents, research stated, "Epilepsy often develops in patients with glioma, and the two conditions share common pathogenic mechanisms. Altered expression of glutamate transporters, including the cystine-glutamate transporter (xCT) system, increases concentrations of extracellular glutamate, which contribute to epileptic discharge, tumor proliferation and peripheral excitotoxicity."

Our news editors obtained a quote from the research from Sorbonne University, "Furthermore, mutation of the isocitrate dehydrogenase 1 gene in low-grade gliomas causes production of D-2-hydroxyglutarate, a steric analogue of glutamate. Dysregulation of intracellular chloride promotes glioma cell mitosis and migration, and γ-aminobutyric acid (GABA) signalling suppresses proliferation. In neurons, however, chloride accumulation leads to aberrant depolarization on GABA receptor activation, thereby promoting epileptic activity. The molecular target of rapamycin (mTOR) pathway and epigenetic abnormalities are also involved in the development of tumours and seizures. Antitumour therapy can contribute to seizure control, and antiepileptic drugs might have beneficial effects on tumours. Symptomatic treatment with antiepileptic drugs carries risks of adverse effects and drug interactions. In this Review, we discuss the potential for single therapeutic agents, such as the xCT blocker sulfasalazine, the chloride regulator bumetanide, and the histone deacetylase inhibitor valproic acid, to manage both gliomas and associated epilepsy. We also provide guidance on the evidence-based use of antiepileptic drugs in brain tumours."

According to the news editors, the research concluded: "The development of solo therapies to treat both aspects of gliomas promises to yield more-effective treatment with fewer risks of toxicity and drug interactions."

The news editors report that additional information may be obtained by contacting G. Huberfeld, Sorbonne University, UPMC University Paris 06, F-75005 Paris, France. The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nrneurol.2016.26. This DOI is a link to an online electronic document that is either free or for purchase.

Biological Factors - Mycotoxins

Studies from South Central University for Nationalities Have Provided New Data on Mycotoxins (Aflatoxin B1 impairs mitochondrial functions, activates ROS generation, induces apoptosis and involves Nrf2 signal pathway in primary broiler ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biological Factors - Mycotoxins. According to news reporting originating from Wuhan, People's Republic of China, by NewsRx correspondents, research stated, "Aflatoxin B1 (AFB1) is known as a mycotoxin that causes various health problems in animals, but the precise mechanism of AFB1 on mitochondrial functions and apoptosis in primary broiler hepatocytes (PBHs) is not clear. The objective of this study was to investigate the effects of AFB1 on the mitochondrial functions, reactive oxygen species (ROS) generation, apoptosis and nuclear factor erythroid 2-like factor 2 (Nrf2)-related signal pathway in PBHs."

Our news editors obtained a quote from the research from South Central University for Nationalities, "Here, the mitochondrial membrane potential (MMP), ROS generation, antioxidative genes and apoptosis in PBHs induced by AFB1 were investigated. The results showed that AFB1 evoked mitochondrial ROS generation, decreased MMP and induced apoptosis in PBHs. AFB1 increased the percentage of apoptotic cells, and expression of caspase-9 and caspase-3, upregulated messenger RNA (mRNA) expression of Nrf2 and downregulated mRNA expressions of NAD(P)H: quinine oxidoreductase 1, superoxide dismutase and Heme oxygenase 1 in PBHs. The expression of Bax was also observed in cytoplasm."

According to the news editors, the research concluded: "These findings suggested AFB1 results in a significant impairment of mitochondrial functions, activates ROS generation, induces apoptosis, and is involved in Nrf2 signal pathway through mitochondria ROS-dependent signal pathways in PBHs."

Oncology - Colon Cancer

Studies from Southeast University Have Provided New Data on Colon Cancer (A tumor suppressive role of IncRNA GAS5 in human colorectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Colon Cancer have been presented. According to news originating from Xuzhou, People's Republic of China, by NewsRx correspondents, research stated, "It is already known that long non-coding RNA growth arrest-specific 5 (GAS5) is downregulated in human colorectal cancer (CRC) cells inhibiting cell proliferation. We further analyzed its involvement in cell cycle distribution and apoptosis induction."

Our news journalists obtained a quote from the research from Southeast University, "We measured the expression level of GAS5 in CRC tissues and cell lines with the corresponding non-tumoral cells. We also analyzed the roles of GAS5 in modulation of cell growth, cell cycle distribution and apoptosis by the CCK-8 method and flow cytometry. Western blots were performed to evaluate the protein level of cyclin D1 and p21 after overexpression of GAS5 Results: GAS5 expression was significantly reduced in CRC samples and cell lines. Overexpression of GAS5 induced cell growth arrest and induced cell apoptosis in vitro. Meanwhile, we found that the growth suppressive role of GAS5 might be attributed to the inhibition of G1-S phase transition, reflected by the downregulation of cyclin D1 and upregulation of p21."

According to the news editors, the research concluded: "Our results demonstrate that GAS5 is a crucial tumor suppressor in human CRC cells."

For more information on this research see: A tumor suppressive role of IncRNA GAS5 in human colorectal cancer. Open Life Sciences, 2016;11(1):105-109. Open Life Sciences can be contacted at: De Gruyter Open Ltd, Bogumila Zuga 32A St, 01-811 Warsaw, Poland.

The news correspondents report that additional information may be obtained from L. Jin, Southeast Univ, Affiliated Hosp, Coll Med, Dept. of Oncol SurgXuzhou Cent Hosp, Xuzhou 221009, People's Republic of China. Additional authors for this research include J.J. Li, K.N. Zhang, Q.Z. Tian and L. Jin.

Studies from Southern Medical University Provide New Data on Science (Prognostic Value of Ezrin in Various Cancers: A Systematic Review and Updated Meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Science have been published. According to news reporting out of Guangzhou, People's Republic of China, by NewsRx editors, research stated, "More and more studies have investigated the effects of Ezrin expression level on the prognostic role in various tumors. However, the results remain controversial rather than conclusive."

Our news journalists obtained a quote from the research from Southern Medical University, "Here, we performed a systematic review and meta-analysis to evaluate the correlation of Ezrin expression with the prognosis in various tumors. The pooled hazard ratios (HR) with the corresponding 95% confidence intervals (95% CI) were calculated to evaluate the degree of the association. The overall results of fifty-five studies with 6675 patients showed that elevated Ezrin expression was associated with a worse prognosis in patients with cancers, with the pooled HRs of 1.86 (95% CI: 1.51-2.31, p<0.001) for overall survival (OS), 2.55 (95% CI: 2.14-3.05, p<0.001) for disease-specific survival (DFS) and 2.02 (95% CI: 1.13-3.63, p=0.018) for disease-specific survival (DSS)/metastasis-free survival (MFS) by the random, fixed and random effect model respectively. Similar results were also observed in the stratified analyses by tumor types, ethnicity background and sample source. This meta-analysis suggests that Ezrin may be a potential prognostic marker in cancer patients."

According to the news editors, the research concluded: "High Ezrin is associated with a poor prognosis in a variety of solid tumors."

For more information on this research see: Prognostic Value of Ezrin in Various Cancers: A Systematic Review and Updated Meta-analysis. Scientific Reports, 2015;5():17903. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting J. Li, Dept. of Traumatology and Orthopedics, Nanfang Hospital, Southern Medical University, Guangzhou 510515, People's Republic of China. Additional authors for this research include K. Wei, H. Yu, D. Oncology - Liver Cancer

Studies from Southern Medical University Reveal New Findings on Liver Cancer (Intraoperative Identification of Liver Cancer Microfoci Using a Targeted Near-Infrared Fluorescent Probe for Imaging-Guided Surgery)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Liver Cancer. According to news reporting out of Guangzhou, People's Republic of China, by NewsRx editors, research stated, "Difficulties in the highly sensitive detection of tumor microfoci represent a critical obstacle toward improved surgical intervention in liver cancer. Conventional preoperative imaging methods and surgeons' subjective experience are limited by their inability to effectively detect tumor lesions measuring less than 2 mm; however, intraoperative fluorescence molecular imaging may overcome this limitation."

Our news journalists obtained a quote from the research from Southern Medical University, "Here, we synthesised an arginine-glycine-aspartic acid (RGD)-conjugated mesoporous silica nanoparticle (MSN) highly loaded with indocyanine green (ICG) dye that could accurately delineate liver cancer margins and provide excellent tumour-to-normal tissue contrast intraoperatively. The increased ICG loading capacity and tumor specificity enabled the identification of residual microtumours and satellite lesions measuring less than 1 mm in living mice. Histological analysis validated the sensitivity and accuracy of this approach."

According to the news editors, the research concluded: "We believe this technique utilising a new fluorescent nanoprobe with intraoperative optical imaging may offer a more sensitive and accurate method for liver cancer resection guidance, resulting in better surgical outcomes."

For more information on this research see: Intraoperative Identification of Liver Cancer Microfoci Using a Targeted Near-Infrared Fluorescent Probe for Imaging-Guided Surgery. Scientific Reports, 2016;6():21959. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting C. Zeng, Dept. of Hepatobiliary Surgery, Zhujiang Hospital, Southern Medical University, Guangzhou 510280, People's Republic of China. Additional authors for this research include W. Shang, K. Wang, C. Chi, X. Jia, C. Fang, D. Yang, J. Ye, C. Fang and J. Tian.

Oncology - Squamous Cell Carcinoma

Studies from Southern Medical University Update Current Data on Squamous Cell Carcinoma (FRMD4A: A potential therapeutic target for the treatment of tongue squamous cell carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Squamous Cell Carcinoma. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "The aim of the present study was to identify agents capable of inhibiting the invasion and metastasis of tongue squamous cell carcinoma and thereby improve the outcomes of patients suffering from tongue cancer. FRMD4A antibodies
were used to probe 78 paraffin-embedded specimens of tongue squamous cell carcinoma and 15 normal tongue tissues, which served as controls."

Our news editors obtained a quote from the research from Southern Medical University, "Immunohistochemical methods were then used for analysis. Clinical pathological parameters were obtained, and the association between FRMD4A expression in the samples and the pathological parameters was analyzed. The human tongue cancer cell line CAL27 was used to study the effects of FRMD4A. CAL27 cells were transfected with small-interfering RNA against FRMD4A (FRMD4A-siRNA) and the mRNA and protein levels of FMRD4A were then evaluated by RT-qPCR and western blot analysis, respectively. The proliferation and cell-cycle assays of CAL27 cells were evaluated using the CCK8 method and flow cytometry. The invasion and migration of the cells were measured using a Matrigel invasion chamber and a scratch assay, respectively. The results showed FRMD4A overexpression in tongue squamous cell carcinoma, and the positive reaction was predominately located in the cytoplasm. Tumor clinical stage and lymph node metastasis showed a statistically significant correlation with FRMD4A expression. Transient silencing of the FRMD4A gene for 24 and 48 h significantly decreased the mRNA and protein expression of FRMD4A, respectively. Silencing FRMD4A gene reduced the proliferation of CAL27 cells and led to cell cycle arrest in the G1 phase, as well as significantly suppressing the migration and invasion capacity of CAL27 cells. The findings of the present study suggest that FRMD4A expression correlates with the development of tongue squamous cell carcinoma."

According to the news editors, the research concluded: "For this reason, FRMD4A merits further study as it may be suitable for use as a therapeutic agent in antitumor treatment regimens."

Skin Diseases and Conditions - Psoriasis

Studies from Spanish National Research Council (CSIC) in the Area of Psoriasis Described [Overexpression of Glucocorticoid-induced Leucine Zipper (GILZ) increases susceptibility to Imiquimod-induced psoriasis and involves cutaneous activation of ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Skin Diseases and Conditions -
Psoriasis. According to research originating in Valencia, Spain, by NewsRx journalists, psoriasis vulgaris is a chronic inflammatory skin disease affecting millions of people. Its pathophysiology is complex and involves a skin compartment with epidermal and immune cells which produce cytokines, e.g. belonging to the IL-23-Th17-cell axis.

The news reporters obtained a quote from the research from Spanish National Research Council (CSIC), "Glucocorticoids (GCs) are the most common therapeutics used in cutaneous inflammatory disorders and GC-induced leucine zipper (GILZ) has emerged as a mediator of GCs due to its anti-inflammatory actions, theoretically lacking GC side-effects. We evaluated whether GILZ may provide a better therapeutic index in comparison to GCs during the onset and progression of psoriasis by generating and characterizing a mouse model with generalized overexpression of this protein (GILZ-Tg mice) and the imiquimod (IMQ) psoriasis model. Unexpectedly, in GILZ-Tg mice, the severity of IMQ-induced psoriasis-like skin lesions as well as induction of cytokines commonly up-regulated in human psoriasis (Il-17, Il-22, Il-23, Il-6, S100a8/a9, and Stat3) was significantly more pronounced relative to GILZ-Wt mice. The increased susceptibility to IMQ-induced psoriasis of GILZ-Tg mice was significantly associated with skin-specific over-activation of TGF-beta 1-mediated signaling via SMAD2/3."

According to the news reporters, the research concluded: "Our findings demonstrate that GILZ may behave as pro-inflammatory protein in certain tissues and that, similar to prolonged GC therapy, GILZ as an alternative treatment for psoriasis may also have adverse effects."

Our news correspondents report that additional information may be obtained by contacting P. Perez, IBV CSIC, E-46010 Valencia, Spain. Additional authors for this research include M. Ballegeer, J. Deckers, C. Riccardi, S. Bruscoli, T. Hochepied, C. Libert and P. Perez.

Studies from St Vincents Clinical School Reveal New Findings on Mevalonate Kinase Deficiency (Mevalonate kinase deficiency leads to decreased prenylation of Rab GTPases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Mevalonate Kinase Deficiency. According to news reporting originating in Sydney, Australia, by NewsRx journalists, research stated, "Mevalonate kinase deficiency (MKD) is
caused by mutations in a key enzyme of the mevalonate-cholesterol biosynthesis pathway, leading to recurrent autoinflammatory disease characterised by enhanced release of interleukin-1 beta (IL-1 beta). It is currently believed that the inflammatory phenotype of MKD is triggered by temperature-sensitive loss of mevalonate kinase activity and reduced biosynthesis of isoprenoid lipids required for the prenylation of small GTPase proteins."

The news reporters obtained a quote from the research from St Vincents Clinical School, "However, previous studies have not clearly shown any change in protein prenylation in patient cells under normal conditions. With lymphoblast cell lines from two compound heterozygous MKD patients, we used a highly sensitive in vitro prenylation assay, together with quantitative mass spectrometry, to reveal a subtle accumulation of unprenylated Rab GTPases in cells cultured for 3 days or more at 40 degrees C compared with 37 degrees C. This included a 200% increase in unprenylated Rab7A, Rab14 and Rab1A. Inhibition of sterol regulatory element-binding protein (SREBP) activation by fatostatin led to more pronounced accumulation of unprenylated Rab proteins in MKD cells but not parent cells, suggesting that cultured MKD cells may partially overcome the loss of isoprenoid lipids by SREBP-mediated upregulation of enzymes required for isoprenoid biosynthesis. Furthermore, while inhibition of Rho/Rac/Rap prenylation promoted the release of IL-1 beta, specific inhibition of Rab prenylation by NE10790 had no effect in human peripheral blood mononuclear cells or human THP-1 monocytic cells."

According to the news reporters, the research concluded: "These studies demonstrate for the first time that mutations in mevalonate kinase can lead to a mild, temperature-induced defect in the prenylation of small GTPases, but that loss of prenylated Rab GTPases is not the cause of enhanced IL-1 beta release in MKD."

For more information on this research see: Mevalonate kinase deficiency leads to decreased prenylation of Rab GTPases. *Immunology and Cell Biology*, 2016;94(10):994-999. *Immunology and Cell Biology* can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. Ethanolamines

Studies from St. George's University of London in the Area of Ethanolamines Described (Kv7 Channel Activation Underpins EPAC-Dependent Relaxations of Rat Arteries)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Ethanolamines. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "To establish the role of Kv7 channels in EPAC (exchange protein directly activated by cAMP)-dependent relaxations of the rat vasculature and to investigate whether this contributes to beta-adrenoceptor-mediated vasorelaxations. Approach and Results-Isolated rat renal and mesenteric arteries (RA and MA, respectively) were used for isometric tension recording to study the relaxant effects of a specific EPAC activator and the beta-adrenoceptor agonist isoproterenol in the presence of potassium channel inhibitors and cell signaling modulators."

Our news journalists obtained a quote from the research from the St. George's University of London, "Isolated myocytes were used in proximity ligation assay studies to detect localization of signaling intermediaries with Kv7.4 before and after cell stimulation. Our studies showed that the EPAC activator (8-pCPT-2Me-cAMP-AM) produced relaxations and enhanced currents of MA and RA that were sensitive to linopirdine (Kv7 inhibitor). Linopirdine also inhibited isoproterenol-mediated relaxations in both RA and MA. In the MA, isoproterenol relaxations were sensitive to EPAC inhibition, but not protein kinase A inhibition. In contrast, isoproterenol relaxations in RA were attenuated by protein kinase A but not by EPAC inhibition. Proximity ligation assay showed a localization of Kv7.4 with A-kinase anchoring protein in both vessels in the basal state, which increased only in the RA with isoproterenol stimulation. In the MA, but not the RA, a localization of Kv7.4 with both Rap1a and Rap2 (downstream of EPAC) increased with isoproterenol stimulation. EPAC-dependent vasorelaxations occur in part via activation of Kv7 channels."

According to the news editors, the research concluded: "This contributes to the isoproterenol-mediated relaxation in mesenteric, but not renal, arteries."

For more information on this research see: Kv7 Channel Activation Underpins EPAC-Dependent Relaxations of Rat Arteries. Arteriosclerosis Thrombosis and Vascular Biology, 2016;36(12):2404-2411. Arteriosclerosis Thrombosis and Vascular Biology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

The news correspondents report that additional information may be obtained from I.A. Greenwood, St. George's University London, Inst Cardiovasc & Cell Sci, Vasc Biol Res Grp, London, United Kingdom. Additional authors for this research include V. Barrese and I.A. Greenwood.

Nutritional and Metabolic Diseases and Conditions - …

Studies from St. Josef Hospital Have Provided New Information about Type 2 Diabetes (Incretin therapies: highlighting common features and differences in the modes of action of glucagon-like peptide-1 receptor agonists and dipeptidyl peptidase-4 ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting originating from Bochum, Germany, by NewsRx editors, the research stated, "Over the last few years, incretin-based therapies have emerged as important agents in the treatment of type 2 diabetes (T2D). These agents exert their effect via the incretin system, specifically targeting the receptor for the incretin hormone glucagon-like peptide 1 (GLP-1), which is partly responsible for augmenting glucose-dependent insulin secretion in response to nutrient intake (the 'incretin effect')."

Financial supporters for this research include Novo Nordisk, Boehringer Ingelheim, Novartis Pharma, MSD GmbH, Metacure, AstraZeneca, GlaxoSmithKline, Roche Pharma AG, Novo Nordisk Pharma GmbH, ToleRx.

Our news editors obtained a quote from the research from St. Josef Hospital, "In patients with T2D, pharmacological doses/concentrations of GLP-1 can compensate for the inability of diabetic b cells to respond to the main incretin hormone glucose-dependent insulinotropic polypeptide, and this is therefore a suitable parent compound for incretin-based glucose-lowering medications. Two classes of incretin-based therapies are available: GLP-1 receptor agonists (GLP-1RAs) and dipeptidyl peptidase-4 (DPP-4) inhibitors. GLP-1RAs promote GLP-1 receptor (GLP-1R) signalling by providing GLP-1R stimulation through 'incretin mimetics' circulating at pharmacological concentrations, whereas DPP-4 inhibitors prevent the degradation of endogenously released GLP-1. Both agents produce reductions in plasma glucose and, as a result of their glucose-dependent mode of action, this is associated with low rates of hypoglycaemia; however, there are distinct modes of action resulting in differing efficacy and tolerability profiles. Furthermore, as their actions are not restricted to stimulating insulin secretion, these agents have also been associated with additional non-glycaemic benefits such as weight loss, improvements in b-cell function and cardiovascular risk markers. These attributes have made incretin therapies attractive treatments for the management of T2D and have presented physicians with an opportunity to tailor treatment plans."

According to the news editors, the research concluded: "This review endeavours to outline the commonalities and differences among incretin-based therapies and to provide guidance regarding agents most suitable for treating T2D in individual patients."

The news editors report that additional information may be obtained by contacting M. Nauck, Division of Diabetology, Medical Dept. of I, St Josef Hospital (Ruhr University Bochum), Bochum, Germany.

Transfusion Medicine - Blood Transfusion

**Studies from St. Louis University Describe New Findings in Blood Transfusion (Transfusion Requirements in ESRD Patients Admitted with GI Hemorrhage Undergoing Inpatient Endoscopy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transfusion Medicine - Blood Transfusion have been published. According to news originating from St. Louis, Missouri, by NewsRx correspondents, research stated, "To date there are no studies evaluating the utilization of blood products in patients with end-stage renal disease (ESRD) with gastrointestinal (GI) hemorrhage. This study estimated transfusion needs and determined predictors available at the time of admission for patients with ESRD admitted to a university hospital with GI bleeding requiring inpatient endoscopy."

Our news journalists obtained a quote from the research from St. Louis University, "A retrospective chart review was performed on all patients with ESRD who underwent inpatient endoscopy for suspected GI bleeding between 2009 and 2015. Ninety-nine hospital admissions from 76 patients met the inclusion criteria. Patients received mean 2.9 +/- 2.6 red blood cell (RBC) units. In the multivariate analysis, increased prothrombin time, low initial hemoglobin, admission to intensive care unit, congestive heart failure, white race (P = 0.08), and syncope (P = 0.09) were independent predictors of RBC transfusion. A total of 28% received fresh frozen plasma and 8% received platelets. Prolonged prothrombin time was the only independent predictor of fresh frozen plasma transfusion (P < 0.001). Platelet transfusion was predicted by thrombocytopenia at platelet counts <100,000/mm(3) (P < 0.001) and white race. Coronary artery disease was associated with reduced platelet transfusion. Other baseline comorbidities, bleeding source, and active/recent hemorrhage on endoscopy did not predict transfusion. Desmopressin use was not associated with reduced RBC needs, even after adjusting for other covariates. Ninety-seven percent of patients survived to discharge. Patients with ESRD admitted to the hospital with GI bleeding have high blood transfusion requirements, which are predicted by variables available at the time of admission."

According to the news editors, the research concluded: "Rockall score and most other predictors of mortality did not predict transfusion."

For more information on this research see: Transfusion Requirements in ESRD Patients Admitted with GI Hemorrhage Undergoing Inpatient Endoscopy. *Southern Medical Journal*, 2016;109(12):785-791. *Southern Medical Journal* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Oncology - Colon Cancer

Studies from St. Mark's Hospital Have Provided New Information about Colon Cancer (The potential impact of local excision for T1 colonic cancer in elderly and comorbid populations: a decision analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Colon Cancer is now available. According to news reporting from Harrow, United Kingdom, by NewsRx journalists, research stated, "Population-based bowel cancer screening has resulted in increasing numbers of patients with T1 colonic cancer. The need for colectomy in this group is questioned due to the low risk of lymphatic spread and increased treatment morbidity, particularly for elderly, comorbid patients."

The news correspondents obtained a quote from the research from St. Mark’s Hospital, "This study examined the quality-of-life benefits and risks of endoscopic resection compared with results after colectomy, for low-risk and high-risk T1 colonic cancer. Decision analysis using a Markov simulation model was performed; patients were managed with either endoscopic resection (advanced therapeutic endoscopy) or colectomy. Lesions were considered high risk according to accepted national guidelines. Probabilities and utilities (perception of quality of life) were derived from published data. Hypothetical cohorts of 65-and 80-year-old, fit and unfit patients with low-risk or high-risk T1 colonic cancer were studied. The primary outcome was quality-adjusted life expectancy (QALE) in life-years (QALYs). In low-risk T1 colonic neoplasia, endoscopic resection increases QALE by 0.09 QALYS for fit 65-year-olds and by 0.67 for unfit 80-year-olds. For high-risk T1 cancers, the QALE benefit for surgical resection is 0.24 QALYs for fit 65-year-olds and the endoscopic QALE benefit is 0.47 for unfit 80-year-olds. The model findings only favored surgery with high local recurrence rates and when quality of life under surveillance was perceived poorly. Under broad assumptions, endoscopic resection is a reasonable treatment option for both low-risk and high-risk T1 colonic cancer, particularly in elderly, comorbid patients."

According to the news reporters, the research concluded: "Exploration of methods to facilitate endoscopic resection of T1 colonic neoplasia appears warranted."

For more information on this research see: The potential impact of local excision for T1 colonic cancer in elderly and comorbid populations: a decision analysis. Gastrointestinal Endoscopy, 2016;84(6):986-994. Gastrointestinal Endoscopy can be contacted at: Mosby-Elsevier, 360 Park Avenue South, New York, NY 10010-1710, USA. (Elsevier -
Arteriovenous Malformation

Studies from Stanford University Hospital Have Provided New Information about Arteriovenous Malformation (Headway Duo microcatheter for cerebral. arteriovenous malformation embolization with n-BCA)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Arteriovenous Malformation. According to news reporting originating from Stanford, California, by NewsRx correspondents, research stated, "Cerebral arteriovenous malformations (AVMs) are uncommon vascular lesions, and hemorrhage secondary to AVM rupture results in significant morbidity and mortality. AVMs may be treated by endovascular embolization, and technical advances in microcatheter design are likely to improve the success and safety of endovascular embolization of cerebral AVMs."

Our news editors obtained a quote from the research from Stanford University Hospital, "To describe our early experience with the Headway Duo microcatheter for embolization of cerebral AVMs with n-butyl-cyanoacrylate (n-BCA). Consecutive patients treated by endovascular embolization of a cerebral AVM with n-BCA delivered intra-arterially through the Headway Duo microcatheter (167 cm length) were identified. Patient demographic information, procedural details, and patient outcome were determined from electronic medical records. Ten consecutive patients undergoing cerebral AVM embolization using n-BCA injected through the Headway Duo microcatheter were identified. Presenting symptoms included headache, hemorrhage, seizures, and weakness. Spetzler Martin grades ranged from 1 to 5, and AVMs were located in the basal ganglia (2 patients), parietal lobe (4 patients), frontal lobe (1 patient), temporal lobe (1 patient), an entire hemisphere (1 patient), and posterior fossa (1 patient). 50 arterial pedicles were embolized, and all procedures were technically successful. There was one post-procedural hemorrhage that was well tolerated by the patient, and no other complications occurred. Additional AVM treatment was performed by surgery and radiation therapy. The Headway Duo microcatheter is safe and effective for embolization of cerebral AVMs using n-BCA."

According to the news editors, the research concluded: "The trackability and high
burst pressure of the Headway Duo make it an important and useful tool for the neurointerventionalist during cerebral AVM embolization."

The news editors report that additional information may be obtained by contacting J.J. Heit, Stanford Univ Hosp, Intervent Neuroradiol Div, Dept. of Radiol, Stanford, CA 94305, United States. Additional authors for this research include A.G.S. Faisal, N.A. Telischak, O. Choudhri and H.M. Do.

Peptide Proteins - Proinsulin

Studies from Stanford University School of Medicine Provide New Data on Proinsulin (Pterostilbene Ameliorates Streptozotocin-Induced Diabetes through Enhancing Antioxidant Signaling Pathways Mediated by Nrf2)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Peptide Proteins - Proinsulin have been published. According to news reporting originating in Palo Alto, California, by NewsRx journalists, research stated, "Nuclear factor erythroid 2-related factor 2 (Nrf2) remains a master regulator of cytoprotective and antioxidant genes. In this study, we investigated the antidiabetic role of pterostilbene (PTS) in streptozotocin (STZ)-induced diabetic model through Nrf2-mediated antioxidant mechanisms."

Funders for this research include Council of Scientific and Industrial Research, Department of Science and Technology, Ministry of Science and Technology.

The news reporters obtained a quote from the research from the Stanford University School of Medicine, "The ability of PTS to activate Nrf2 in MIN6 cells was assessed by dissociation of the Nrf2-Keap1 complex at different time points and by expression of ARE-driven downstream target genes of Nrf2. Immunoblot experiments examining Nrf2 activation and phosphorylation indicated that it conferred cytoprotection against STZ-induced cellular damage. In STZ-induced diabetic mice, PTS administration significantly decreased blood glucose levels through the improvement of insulin secretion. In addition, we also observed insulin-positive cells with recovered islet architecture in the pancreas of STZ-induced diabetic mice after treatment with PTS. The activation of Nrf2 and expression of its downstream target genes were observed upon PTS treatment, thereby reducing oxidative damage to pancreas. Furthermore, PTS treatment significantly reverted the abundance of key glucose metabolism
enzymes, such as hexokinase, glucose-6-phosphatase, glucose-6-phosphate dehydrogenase, and fructose-1,6-bisphosphatase, to near-normal levels in liver tissue of STZ-induced diabetic mice."

According to the news reporters, the research concluded: "These results clearly indicate that PTS maintains glucose homeostasis, suggesting the possibility that it is a future candidate for use in diabetes management."

For more information on this research see: Pterostilbene Ameliorates Streptozotocin-Induced Diabetes through Enhancing Antioxidant Signaling Pathways Mediated by Nrf2. *Chemical Research In Toxicology, 2016;29(1):47-57.* (American Chemical Society - www.acs.org; Chemical Research In Toxicology - www.pubs.acs.org/journal/crtoec)

**Oncology - Ovarian Cancer**

**Studies from Sun Yat Sen University Describe New Findings in Ovarian Cancer (MiR-760 overexpression promotes proliferation in ovarian cancer by downregulation of PHLPP2 expression)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Ovarian Cancer have been published. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Ovarian cancer is one of the most lethal gynecologic malignancies worldwide and with poor prognosis and survival rate in women. Identifying sensitive and specific molecular in carcinogenesis may improve diagnostic and therapeutic strategies for this malignancy and achieve a better clinical outcome."

Funders for this research include Natural Science Foundation of Guangdong Province, The Science and Technology Projects Foundation of Guangzhou City Huangpu District.

Our news editors obtained a quote from the research from Sun Yat Sen University, "miR-760 expression in ovarian cancer cell lines and patient tissues were determined using Real-time PCR. 145 human ovarian cancer tissue samples were analyzed by RT-PCR to investigate the association between miR-760 expression and the clinicopathological characteristics of ovarian cancer patients. Functional assays, such as MTT, anchorage-independent growth, colony formation and BRDU assay were used to determine the oncogenic role of miR-760 in human ovarian cancer progression. Furthermore, western blotting and luciferase assay were used to determine the mechanism of miR-760 promotes proliferation in ovarian cancer cells. The expression of miR-760 was markedly upregulated in ovarian cancer..."
cell lines and tissues, and high miR-760 expression was associated with an aggressive phenotype and poor prognosis with ovarian cancer patients. Upregulation of miR-7760 promoted, whereas downregulation of miR-760 inhibited the proliferation of ovarian cancer cells in vitro. Additionally, we identified PHLPP2 as a direct target of miR-760, and silencing the expression of PHLPP2 is the essential biological function of miR-760 during ovarian cancer cell proliferation. Finally, we showed a significant correlation between miR-760 and PHLPP2 expression in ovarian cancer tissues."

According to the news editors, the research concluded: "Our findings suggest that miR-760 represents a potential onco-miR and participates in ovarian cancer carcinogenesis, which highlight its potential as a target for ovarian cancer therapy."

For more information on this research see: MiR-760 overexpression promotes proliferation in ovarian cancer by downregulation of PHLPP2 expression. *Gynecologic Oncology*, 2016;143(3):655-663. *Gynecologic Oncology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Studies from Sun Yat Sen University in the Area of Type 2 Diabetes Described (Associations of polymorphisms in TXNIP and gene-environment interactions with the risk of coronary artery disease in a Chinese Han population)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting originating in Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Single nucleotide polymorphisms (SNPs) in thioredoxin-interacting protein (TXNIP) gene may modulate TXNIP expression, then increase the risk of coronary artery disease (CAD). In a two-stage case-control study with a total of 1818 CAD patients and 1963 controls, we genotyped three SNPs in TXNIP and found that the variant genotypes of SNPs rs7212 [ odds ratio (OR) = 1.26, P = 0.001] and rs7211 (OR = 1.23, P = 0.005) were significantly associated with increased CAD risk under a dominant model."

Financial support for this research came from National Basic Research Program of
The news reporters obtained a quote from the research from Sun Yat Sen University, "In haplotype analyses, compared with the reference haplotype, haplotype 'G-T' had a 1.22-fold increased risk of CAD (P = 0.003). We also observed the cumulative effects of SNPs rs7212 and rs7211 on CAD risk and the severity of coronary atherosclerosis. Moreover, the gene-environment interactions among the variant genotypes of SNP rs7212, smoking habit, alcohol drinking habit and history of type 2 diabetes were associated with a 3.70-fold increased risk of CAD (P < 0.001). Subsequent genotype-phenotype correlation analyses further observed the significant effects of SNP rs7212 on TXNIP mRNA expression, plasma TXNIP and malondialdehyde levels."

According to the news reporters, the research concluded: "Taken together, our data suggest that TXNIP SNPs may individually and cumulatively affect CAD risk through a possible mechanism for regulating TXNIP expression and gene-environment interactions."

Our news correspondents report that additional information may be obtained by contacting C. Li, Sun Yat Sen UniversityZhongshan Sch Med, Guangzhou, Guangdong, People's Republic of China. **Oncology - Gastric Cancer**

**Studies from Sungkyunkwan University Have Provided New Information about Gastric Cancer (Does the interval of screening endoscopy affect survival in gastric cancer patients? A cross-sectional study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Gastric Cancer is the subject of a report. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Gastric cancer remains the second most common cancer in Korea; however, its mortality has decreased due to earlier diagnosis. In Korea, screening endoscopy has been performed nationwide since 1999."

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Gastric Cancer is the subject of a report. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Gastric cancer remains the second most common cancer in Korea; however, its mortality has decreased due to earlier diagnosis. In Korea, screening endoscopy has been performed nationwide since 1999."

Oncology - Gastric Cancer
Our news editors obtained a quote from the research from Sungkyunkwan University. "The aim of this study was to elucidate the benefit of screening endoscopy on actual survival in gastric cancer patients and to determine the optimal interval of screening endoscopy. We analyzed 1651 patients diagnosed with gastric adenocarcinoma who underwent surgical treatment between June 2008 and December 2014. Patients were divided into 4 groups according to the interval of screening endoscopy prior to their gastric cancer diagnosis. (Group I=within 1 year, Group II= >1 but <2 years, Group III=more than 2 years, Group IV=no prior endoscopic examination). Patient demographics, clinicopathologic characteristics, and postoperative surgical outcomes including overall survival were compared. The 5-year gastric cancer-specific survival rates of groups I and II were significantly higher than groups III and IV (90.9% vs 85.4%, P=0.002, respectively). Multivariate analysis showed that screening interval was an independent factor for the diagnosis of advanced gastric cancer. The risk of advanced gastric cancer decreased in group I (odds ratio: 0.515, 95% confidence interval [CI] 0.369-0.719; P<0.001) and group II (odds ratio: 0.678, 95% CI 0.517-0.889, P=0.005). Screening endoscopy was helpful in increasing the survival of gastric cancer patients."

According to the news editors, the research concluded: "A 2-year endoscopic screening interval is suitable to detect early-stage gastric cancer."

For more information on this research see: Does the interval of screening endoscopy affect survival in gastric cancer patients? A cross-sectional study. Medicine, 2016;95(49):213-218. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Oncology - Non-Small Cell Lung Cancer

Studies from Sungkyunkwan University School of Medicine Further Understanding of Non-Small Cell Lung Cancer (Low EGFR/MET ratio is associated with resistance to EGFR inhibitors in non-small cell lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Non-Small Cell Lung Cancer. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Although activating mutations in the epidermal growth factor receptor (EGFR) gene are predictive markers for response to EGFR inhibitors, 30-40% of EGFR-mutant non-small cell lung cancer (NSCLC) patients are de novo non-responders. Hence, we sought to explore additional biomarkers of response."
The news correspondents obtained a quote from the research from the Sungkyunkwan University School of Medicine, "We conducted a prospective pilot study to characterize the expression and/or activation of key receptor tyrosine kinases (RTKs) in stage IIIB-IV NSCLC tumors. A total of 37 patients were enrolled and 34 underwent EGFR inhibitor treatment. As expected, patients bearing activating EGFR mutations showed increased progression free survival (PFS) compared to patients with wild-type EGFR status (9.3 vs 1.4 months, p=0.0629). Analysis of baseline tumor RTK profiles revealed that, regardless of EGFR mutation status, higher levels of EGFR relative to MET correlated with longer PFS. At multiple EGFR/MET ratio cut-offs, including 1, 2 and 3, median PFS according to below vs. above cut-offs were 0.4 vs. 6.1 (p=0.0001), 0.5 vs. 9.3 (p=0.0006) and 1.0 vs. 11.2 months (p=0.0008), respectively."

According to the news reporters, the research concluded: "The EGFR/MET ratio measured in tumors at baseline may help identify NSCLC patients most likely to benefit from prolonged PFS when treated with EGFR inhibitors."

For more information on this research see: Low EGFR/MET ratio is associated with resistance to EGFR inhibitors in non-small cell lung cancer. Oncotarget, 2015;6(31):30929-38.

Cyclohexanes

Studies from Suny Downstate Medicine Center Describe New Findings in Cyclohexanes (Ketamine A Cause of Urinary Tract Dysfunction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cyclohexanes are presented in a new report. According to news originating from Brooklyn, New York, by NewsRx correspondents, research stated, "Drug addiction as a result of improper use of prescribed and illicit use has been on the increase globally."

Our news journalists obtained a quote from the research from Suny Downstate Medicine Center, "The effects of such use have implications in the urologic disease space. To this end, Ketamine has been reported to affect urologic function, causing a number of voiding symptoms."

According to the news editors, the research concluded: "It may also confound the differential diagnosis of urologic diseases, such as interstitial cystitis, among others."

For more information on this research see: Ketamine A Cause of Urinary Tract Dysfunction. Clinics in Laboratory Medicine, 2016;36(4):721-744,CP3. Clinics in Laboratory
Studies from SyNergy Further Understanding of Dystonia
(Haploinsufficiency of KMT2B, Encoding the Lysine-Specific Histone Methyltransferase 2B, Results in Early-Onset Generalized Dystonia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nervous System Diseases and Conditions - Dystonia have been presented. According to news reporting out of Munich, Germany, by NewsRx editors, research stated, "Early-onset generalized dystonia represents the severest form of dystonia, a hyperkinetic movement disorder defined by involuntary twisting postures. Although frequently transmitted as a single-gene trait, the molecular basis of dystonia remains largely obscure."

Funders for this research include Else Kroner-Fresenius-Stiftung, Technische Universität Munchen, Helmholtz Zentrum Munchen, Medizinische Universität Innsbruck, Langmatz-Stiftung, German Federal Ministry of Education and Research.

Our news journalists obtained a quote from the research from SyNergy, "By whole-exome sequencing a parent-offspring trio in an Austrian kindred affected by non-familial early-onset generalized dystonia, we identified a dominant de novo frameshift mutation, c.6406delC (p.Leu2136Serfs*17), in KMT2B, encoding a lysine-specific methyltransferase involved in transcriptional regulation via post-translational modification of histones. Whole-exome-sequencing-based exploration of a further 30 German-Austrian individuals with early-onset generalized dystonia uncovered another three deleterious mutations in KMT2B—one de novo nonsense mutation (c.1633C >T [p.Arg545*]), one de novo essential splice-site mutation (c.7050-2A >G [p.Phe2321Serfs*93]), and one inherited nonsense mutation (c.2428C >T [p.Gln810*]) co-segregating with dystonia in a three-generation kindred. Each of the four mutations was predicted to mediate a loss-of-function effect by introducing a premature termination codon. Suggestive of haploinsufficiency, we found significantly decreased total mRNA levels of KMT2B in mutant fibroblasts. The phenotype of individuals with KMT2B loss-of-function mutations was dominated by childhood lower-limb-onset generalized dystonia, and the family harboring c.2428C >T (p.Gln810*) showed variable expressivity. In most cases, dystonic symptoms were accompanied by heterogeneous non-motor features. Independent support for pathogenicity of the mutations comes from the observation of high rates of dystonic presentations in KMT2B-involving microdeletion syndromes. Our findings thus establish generalized dystonia as the human phenotype associated with haploinsufficiency of KMT2B."
According to the news editors, the research concluded: "Moreover, we provide evidence for a causative role of disordered histone modification, chromatin states, and transcriptional deregulation in dystonia pathogenesis."

Our news journalists report that additional information may be obtained by contacting J. Winkelmann, SyNergy, Munich Cluster Syst Neurol, D-81377 Munich, Germany. Additional authors for this research include S. Boesch, E.M. Maier, I. Borggraefe, K. Vill, F. Laccone, V. Pilshofer, A. Ceballos-Baumann, B. Alhaddad, R. Berutti, W. Poewe, T.B. Haack, B. Haslinger, T.M. Strom and J. Winkelmann.

Drugs and Therapies - Antimalarial Agents

Studies from T. Jeanson and Co-Researchers in the Area of Antimalarial Agents Reported (Potentiation of Amitriptyline Anti-Hyperalgesic-Like Action By Astroglial Connexin 43 Inhibition in Neuropathic Rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antimalarial Agents is the subject of a report. According to news reporting originating from Lyon, France, by NewsRx correspondents, research stated, "Antidepressants, prescribed as first line treatment of neuropathic pain, have a limited efficacy and poorly tolerated side effects. Because recent studies pointed out the implication of astroglial connexins (Cx) in both neuropathic pain and antidepressive treatment, we investigated whether their blockade by mefloquine could modulate the action of the tricyclic antidepressant amitriptyline."

Our news editors obtained a quote from the research, "Using primary cultures, we found that both mefloquine and amitriptyline inhibited Cx43-containing gap junctions, and that the drug combination acted synergically. We then investigated whether mefloquine could enhance amitriptyline efficacy in a preclinical model of neuropathic pain. Sprague-Dawley rats that underwent chronic unilateral constriction injury (CCI) to the sciatic nerve (SN) were treated with either amitriptyline, mefloquine or the combination of both drugs. Whereas acute treatments were ineffective, chronic administration of amitriptyline reduced CCI-SN-induced hyperalgesia-like behavior, and this effect was markedly enhanced by co-administration of
mefloquine, which was inactive on its own. No pharmacokinetic interactions between both drugs were observed and CCI-SN-induced neuroinflammatory and glial activation markers remained unaffected by these treatments in dorsal root ganglia and spinal cord. Mechanisms downstream of CCI-SN-induced neuroinflammation and glial activation might therefore be targeted."

According to the news editors, the research concluded: "Connexin inhibition in astroglia could represent a promising approach towards improving neuropathic pain therapy by antidepressants."

For more information on this research see: Potentiation of Amitriptyline Anti-Hyperalgesic-Like Action By Astroglial Connexin 43 Inhibition in Neuropathic Rats. Scientific Reports, 2016:6():1-12. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting M. Charveriat, Theranexus, Lyon, France. Additional authors for this research include A. Duchene, D. Richard, S. Bourgoin, C. Picoli, P. Ezan, F. Mouthon, C. Giaume, M. Hamon and M. Charveriat.

Pharmacokinetics

Studies from Tata Memorial Hospital Further Understanding of Pharmacokinetics (Determination and Pharmacokinetic Study of Pirfenidone in Rat Serum by High-Performance Thin-Layer Chromatography)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Pharmacokinetics are presented in a new report. According to news reporting originating in Maharashtra, India, by NewsRx journalists, research stated, "A rapid, sensitive and selective high-performance thin-layer chromatography (HPTLC) method was developed and validated for the determination and pharmacokinetics of pirfenidone in rat serum. One-step protein precipitation by methanol is reported, and serum samples were separated by HPTLC using a simple mobile phase of toluene-methanol in the ratio of 8:2."

The news reporters obtained a quote from the research from Tata Memorial Hospital, "The retardation factor of pirfenidone in the serum sample was 0.45 with the detection performed at 315 nm. The calibration curve was linear over the range of 100-1,200 ng/spot with a lower limit of quantitation of 40 ng/spot. The mean recovery of pirfenidone in serum was in the range of 70.6-75.8%, and intra-day and inter-day precision were both <14.1%.

According to the news reporters, the research concluded: "This method was successfully applied to the pharmacokinetic study of pirfenidone in rats on oral administration
of the drug at a dose of 15.0 mg/kg."

Our news correspondents report that additional information may be obtained by contacting R.V. Chikhale, Tata Mem Hosp, ACTREC, Bombay 410210, Maharashtra, India.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/chromsci/bmw067. This DOI is a link to an online electronic document that is either free or for purchase.

**Liver Diseases and Conditions - Hepatitis B Virus**

**Studies from Tata Memorial Hospital in the Area of Hepatitis B Virus Reported (Hepatitis B-related serological events in hematopoietic stem cell transplant patients and efficacy of lamivudine prophylaxis against reactivation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Liver Diseases and Conditions - Hepatitis B Virus are discussed in a new report. According to news reporting out of Maharashtra, India, by NewsRx editors, research stated, "Reactivation of remote hepatitis B infection (RHBI) is an important cause of morbidity in hematopoietic cell transplant (HCT) patients. We analyzed the prevalence of RHBI in 205 patients who underwent HCT in our centre, serological events related to hepatitis B virus (HBV) reactivation and role of lamivudine prophylaxis in HCT patients with RHBI."

Our news journalists obtained a quote from the research from Tata Memorial Hospital, "The prevalence of RHBI was 14% (28/205 patients). Of these 28 patients, 15 received lamivudine prophylaxis (14 anti-HBcIgG positive and 1 only anti-HBs positive) while 13 did not receive lamivudine prophylaxis (12 anti-HBs positive and 1 anti-HBcIgG positive). None in prophylaxis group developed HBV reactivation while 12 of 13 in no-prophylaxis group reactivated (P < 0.001). The rate of HBV reactivation was 10% (21/205 patients), which included 9 patients with no evidence of RHBI pre-transplant. We conclude that lamivudine prophylaxis protects against HBV reactivation in HCT patients with evidence of RHBI. Lamivudine prophylaxis should be used not only in patients with anti-HBcIgG positivity but also in those with isolated anti-HBs positivity pre-transplant given the high rate of HBV reactivation in these patients."

According to the news editors, the research concluded: "HBV serology cannot identify all cases with RHBI and therefore does not preclude HBV reactivation post-transplant."

For more information on this research see: Hepatitis B-related serological events in hematopoietic stem cell transplant patients and efficacy of lamivudine prophylaxis against

Our news journalists report that additional information may be obtained by contacting N. Khattry, Tata Mem Hosp, Dept. of Med Oncol, Bone Marrow Transplant Unit, ACTREC, Bombay, Maharashtra, India. **Studies from Technical University Add New Findings in the Area of Congenital Heart Disease (Interstitial 1q23.3q24.1 Deletion in a Patient with Renal Malformation, Congenital Heart Disease, and Mild Intellectual Disability)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Congenital Diseases and Conditions - Congenital Heart Disease are discussed in a new report. According to news reporting from Dresden, Germany, by NewsRx journalists, research stated, "Interstitial deletions including chromosome region 1q23.3q24.1 are rare. Only eight patients with molecularly characterized deletions have been reported to date."

The news correspondents obtained a quote from the research from Technical University, "Their phenotype included intellectual disability/developmental delay, growth retardation, microcephaly, congenital heart disease, and renal malformations. We report on a female patient with mild developmental delay, congenital heart disease, and bilateral renal hypoplasia in whom an interstitial de novo deletion of approximately 2.7Mb in 1q23.3q24.1 was detected by array CGH. This is the smallest deletion described in this region so far."

According to the news reporters, the research concluded: "Genotype-phenotype comparison with previously published patients allowed us to propose LMX1A and RXRG as potential candidate genes for intellectual disability, PBX1 as a probable candidate gene for renal malformation, and enabled us to narrow down a chromosome region associated with microcephaly."

Our news journalists report that additional information may be obtained by
contacting L. Mackenroth, Technical University of Dresden, Inst Klin Genet, Medical Fak Carl Gustav Carus, D-01307 Dresden, Germany. Additional authors for this research include K. Hackmann, B. Klink, J.S. Weber, B. Mayer, E. Schrock and A. Tzschach.

Oncology - Bone Cancer

Studies from Technical University Further Understanding of Bone Cancer (WNT5A and Its Receptors in the Bone-Cancer Dialogue)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Bone Cancer have been published. According to news originating from Dresden, Germany, by NewsRx correspondents, research stated, "Wnt signaling is critical for tumorigenesis and skeletal remodeling. However, its contribution to the formation of metastatic bone lesions remains poorly defined."

Our news journalists obtained a quote from the research from Technical University, "One major challenge of unraveling its role in cancer progression is the high complexity of Wnt signaling, which includes numerous ligands, receptors, and inhibitors, with intricate biological effects and specific signaling pathways depending on the cellular context. In this perspective, we summarize the role of the noncanonical Wnt ligand WNT5A in the development and metastatic process of osteotropic cancer entities."

According to the news editors, the research concluded: "We focus on its tumor-suppressive function in breast cancer, tumor promoting effects in melanoma, and ambiguous role in prostate cancer, and discuss potential challenges and opportunities that may be associated with targeting Wnt signaling for cancer therapy and treatment of bone metastases."

The news correspondents report that additional information may be obtained from L.C. Hofbauer, Technical University of Dresden, Medical Center, Center Hlth Aging, Dresden, Germany. Additional authors for this research include T.D. Rachner, M. Rauner and L.C. Hofbauer.

Keywords for this news article include: Dresden, Germany, Europe, Bone Research, Bone Cancer, Oncology, Technical University.

Studies from Technical University Provide New Data on Antineoplastics (Half generations magnetic PAMAM dendrimers as an effective system for targeted gemcitabine delivery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antineoplastics are presented in a new report. According to news reporting originating in Ankara, Turkey, by NewsRx journalists, research stated, "Tumor-specific delivery of anticancer drugs by magnetic nanoparticles will maximize the efficacy of the drug and minimize side effects, and reduce systemic toxicity. The magnetic core of these nanoparticles provides an advantage for selective drug targeting as they can be targeted to the tumor site and accumulated in cancer cells by means of an external magnetic field."

The news reporters obtained a quote from the research from Technical University, "Magnetic nanoparticles can be coated with Polyamidoamine (PAMAM) dendrimer and loaded with drugs. However, biomedical applications of PAMAM dendrimers are limited due to their toxicity associated with their multiple cationic charges due to terminal -NH2 groups. Modifying the positively charged end groups with negatively charged -COOH groups, is a satisfactory strategy for obtaining less toxic PAMAM dendrimers. Gemcitabine being an analogue of deoxycytidine, is an effective anticancer drug. However, clinical benefits of Gemcitabine are limited due to its short biological half-life. The aim of this study was to obtain an effective, less toxic targeted delivery system for Gemcitabine. Half generations, between G4.5 and G7.5, of PAMAM dendrimer coated magnetic nanoparticles (DcMNPs) were synthesized and conjugated with Gemcitabine. TEM images showed nanoscale size (12-14 nm) of the nanoparticles. The zeta-potential analysis indicated a decreased negativity of surface charge in drug bound dendrimer compared to the empty nanoparticles. Gemcitabine was effectively conjugated successfully onto the surface of half-generations of PAMAM DcMNPs. It was observed Gemcitabine did not effectively bind to Generations G4 and G5. The highest drug loading was obtained for DcMNPs with Generation 5.5. Empty nanoparticles showed no significant cytotoxicity on SKBR-3 and MCF-7 cells. On the other hand, Gemcitabine loaded nanoparticles were 6.0 fold more toxic on SKBR-3 and 3.0 fold more toxic on MCF-7 cells compared to free Gemcitabine. Gemcitabine loaded on Generation 5.5 DcMNPs showed a higher stability than free Gemcitabine. About 94% of the drug was retained over 6 weeks period, at pH 7.2."

According to the news reporters, the research concluded: "Due to their targetability under magnetic field, stability, size distribution, cellular uptake and toxicity characteristics the dendrimeric nanoparticles obtained in this study can be useful a delivery system for Gemcitabine in cancer therapy."

For more information on this research see: Half generations magnetic PAMAM dendrimers as an effective system for targeted gemcitabine delivery. International Journal of Pharmaceutics, 2016;515(1-2):104-113. International Journal of Pharmaceutics can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Cardiovascular Diseases and Conditions - Vasculitis

Studies from Technical University Yield New Information about Vasculitis (Spotlight on rituximab in the treatment of antineutrophil cytoplasmic antibody-associated vasculitis: current perspectives)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Vasculitis are presented in a new report. According to news originating from Munich, Germany, by NewsRx correspondents, research stated, "A 54-year-old patient presented to his general practitioner because of strong muscle pain in both thighs. Inflammatory parameters (CRP 16.3 mg/dL) and white blood cells (15 g/L) were elevated."

Our news journalists obtained a quote from the research from Technical University, "The patient reported a weight loss of 10 kg in 4 weeks. There was no fever or any other specific symptoms. Urine dipstick examination and computed tomography of the chest were unremarkable. Because of increasing symptoms, the patient was referred to our department. Magnetic resonance tomography showed diffuse inflammatory changes of the muscles of both thighs. Neurological examination and electrophysiology revealed axonal sensorimotor neuropathy and ground-glass opacities of both lungs had occurred. Serum creatinine increased to 229 mmol/L within a few days, with proteinuria of 3.3 g/g creatinine. Kidney biopsy showed diffuse pauci-immune proliferative glomerulonephritis. Proteinase 3-specific antineutrophil cytoplasmic antibodies were markedly increased. Birmingham Vasculitis Activity Score was 35. Within 2 days, serum creatinine further increased to 495 mmol/L. Plasma exchange, high-dose glucocorticosteroids, and hemodialysis were started. The patient received cyclophosphamide 1 g twice and rituximab 375 mg/m(2) four times according to the RITUXVAS protocol. Despite ongoing therapy, hemodialysis could not be withdrawn and had to be continued over 3 weeks until diuresis normalized. Glucocorticosteroids were tapered to 20 mg after 2 months, and serum creatinine was 133 mmol/L. However, nephritic urinary sediment reappeared. Another dose of 1 g cyclophosphamide was given, and glucocorticosteroids were raised for another 4 weeks. After 6 months, the daily prednisolone dose was able to be tapered to 5 mg. Serum creatinine was 124 mmol/L, proteinuria further decreased to 382 mg/g creatinine, and the Birmingham Vasculitis Activity Score was 0. Maintenance therapy with rituximab 375 mg/m(2) every 6 months was started."

According to the news editors, the research concluded: "At the last visit after 8 months, the patient was still in remission, with only minor persistent dysesthesia of the left foot
and a persistent serum creatinine of 133 mmol/L."

The news correspondents report that additional information may be obtained from P. Moog, Abteilung fur Nephrologie, Klinikum rechts der Isar, Technische Universität München, Munich, Germany.

**Studies from Tel Aviv University Further Understanding of Science**

**Maternal immune activation produces neonatal excitability defects in offspring hippocampal neurons from pregnant rats treated with poly I:C**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Science are discussed in a new report. According to news reporting originating in Tel Aviv, Israel, by NewsRx journalists, research stated, "Maternal immune activation (MIA) resulting from prenatal exposure to infectious pathogens or inflammatory stimuli is increasingly recognized to play an important etiological role in neuropsychiatric disorders with neurodevelopmental features. MIA in pregnant rodents induced by injection of the synthetic double-stranded RNA, Poly I:C, a mimic of viral infection, leads to a wide spectrum of behavioral abnormalities as well as structural and functional defects in the brain."

The news reporters obtained a quote from the research from Tel Aviv University, "Previous MIA studies using poly I:C prenatal treatment suggested that neurophysiological alterations occur in the hippocampus. However, these investigations used only juvenile or adult animals. We postulated that MIA-induced alterations could occur earlier at neonatal/early postnatal stages. Here we examined the neurophysiological properties of cultured pyramidal-like hippocampal neurons prepared from neonatal (P0-P2) offspring of pregnant rats injected with poly I:C. Offspring neurons from poly I:C-treated mothers exhibited significantly lower intrinsic excitability and stronger spike frequency adaptation, compared to saline. A similar lower intrinsic excitability was observed in CA1 pyramidal neurons from hippocampal slices of two weeks-old poly I:C offspring. Cultured hippocampal neurons also displayed lower frequency of spontaneous firing, higher charge transfer of IPSCs and larger amplitude of miniature IPSCs."

According to the news reporters, the research concluded: "Thus, maternal immune activation leads to strikingly early neurophysiological abnormalities in hippocampal neurons."
For more information on this research see: Maternal immune activation produces neonatal excitability defects in offspring hippocampal neurons from pregnant rats treated with poly I:C. *Scientific Reports*, 2016;6():19106. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news correspondents report that additional information may be obtained by contacting E. Patrich, Dept. of Physiology & Pharmacology, Sackler Faculty of Medicine, Tel Aviv University, Tel Aviv 69978, Israel. Additional authors for this research include Y. Piontkewitz, A. Peretz, I. Weiner and B. Attali.

**Nephrology**

**Studies from Tel Aviv University Yield New Data on Nephrology**

(Prenatal diagnosis of 17q12 deletion syndrome: from fetal hyperechogenic kidneys to high risk for autism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nephrology. According to news reporting originating in Tel Aviv, Israel, by NewsRx journalists, research stated, "The linkage between 17q12 microdeletions, renal anomalies, and higher risk for neurodevelopmental disorders is well described in the literature. The current study presents prenatal diagnosis of normal-sized fetal hyperechogenic kidneys leading to the diagnosis of 17q12 deletion syndrome and autism spectrum disorder."

The news reporters obtained a quote from the research from Tel Aviv University, "Over a period of 9 years in a single referral center, seven fetuses were diagnosed with hyperechogenic renal parenchyma and were followed up prospectively. Amniocentesis for molecular diagnosis was performed in all cases, and subsequently, five fetuses were found to harbor a 17q12 deletion by chromosomal microarray analysis. Postnatal evaluation was carried out by a developmental neurologist. Five of the seven fetuses had molecular diagnosis of 17q12 deletion. One patient elected termination of pregnancy. On long-term follow-up, all of the four children showed symptoms consistent with neurodevelopmental disorders. The two fetuses with no deletion have a normal follow-up with regression of the renal hyperechogenicity."

According to the news reporters, the research concluded: "We report a strikingly high correlation between prenatal hyperechogenic kidneys, 17q12 microdeletion, and autism spectrum disorder with the advantage of optimal prenatal counseling as well as early diagnosis and intervention."

Our news correspondents report that additional information may be obtained by
Studies from Texas A&M University Add New Findings in the Area of Aorta (Strain survey and genetic analysis of vasoreactivity in mouse aorta)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Aorta have been published. According to news originating from College Station, Texas, by NewsRx correspondents, research stated, "Understanding the genetic influence on vascular reactivity is important for identifying genes underlying impaired vascular function. The purpose of this study was to characterize the genetic contribution to intrinsic vascular function and to identify loci associated with phenotypic variation in vascular reactivity in mice."

Financial support for this research came from HHS | NIH | National Heart, Lung, and Blood Institute (NHBLI).

Our news journalists obtained a quote from the research from Texas A&M University, "Concentration response curves to phenylephrine (PE), potassium chloride (KCl), acetylcholine (ACh), and sodium nitroprusside (SNP) were generated in aortic rings from male mice (12 wk old) from 27 inbred mouse strains. Significant strain-dependent differences were found for both maximal responses and sensitivity for each agent, except for SNP Max (%). Strain differences for maximal responses to ACh, PE, and KCl varied by two- to fivefold. On the basis of these large strain differences, we performed genome-wide association mapping (GWAS) to identify loci associated with variation in responses to these agents. GWAS for responses to ACh identified four significant and 19 suggestive loci. Several suggestive loci for responses to SNP, PE, and KCl (including one significant locus for KCl EC50) were also identified. These results demonstrate that intrinsic endothelial function, and more generally vascular function, is genetically determined and associated with multiple genomic loci. Furthermore, these results are supported by the finding that several genes residing in significant and suggestive loci for responses to ACh were previously identified in rat and/or human quantitative trait loci/GWAS for cardiovascular disease."

According to the news editors, the research concluded: "This study represents the first step toward the unbiased comprehensive discovery of genetic determinants that regulate intrinsic vascular function, particularly endothelial function."

For more information on this research see: Strain survey and genetic analysis of vasoreactivity in mouse aorta. Physiological Genomics, 2016;48(11):861-873. Physiological Genomics can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Gastroenterology - Colorectal Research

Studies from Texas A&M University Have Provided New Information about Colorectal Research (Plum polyphenols inhibit colorectal aberrant crypt foci formation in rats: potential role of the miR-143/protein kinase B/mammalian target of rapamycin ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gastroenterology - Colorectal Research have been presented. According to news reporting originating from College Station, Texas, by NewsRx correspondents, research stated, "The nutritional prevention of aberrant crypt foci by polyphenols may be a crucial step to dietary cancer prevention. The objective of this study was to determine the underlying mechanisms that contribute to the anti-inflammatory and antitumorigenic properties of plum (Prunus salicina L.) polyphenols, including chlorogenic acid and neochlorogenic acid, in azoxymethane (AOM)-treated rats."

Financial support for this research came from Vegetable & Fruit Improvement Center.

Our news editors obtained a quote from the research from Texas A&M University, "The hypothesis was that plum polyphenolics suppress AOM-induced aberrant crypt foci formation through alterations in the protein kinase B (AKT)/mammalian target of rapamycin (mTOR) pathway and relative micro-RNA expressions. Sprague-Dawley rats (n = 10/group) received plum beverage (1346 mg gallic acid equivalents/L) or a control beverage ad libitum for 10 weeks with subcutaneous injections of AOM (15 mg/kg) at weeks 2 and 3. Results show that the consumption of the plum beverage decreased the number of dysplastic aberrant crypt foci by 48% (P < .05) and lowered proliferation of mucosal cells by 24% (P < .05). The plum beverage decreased the activity of glutathione peroxidase, superoxide dismutase, and catalase in mucosal scrapings, as well as the superoxide dismutase activity in serum. The results were accompanied by a down-regulation of proinflammatory enzymes nuclear factor kappa B, nitric oxide synthase, cyclooxygenase-2, and vascular cell adhesion molecule 1 messenger RNA. Plum inhibited the expression of AKT and mTOR messenger RNA, phosphorylated AKT, mTOR, and hypoxiainducible factor-la protein levels, and the ratio of the phosphorylated/total protein expression of mTOR. Also, the plum beverage increased the expression of miR-143, which is involved in the regulation of AKT."

According to the news editors, the research concluded: "These results suggest that plum polyphenols may exhibit a chemopreventive potential against colon carcinogenesis by impacting the AKT/mTOR pathway and miR-143."

For more information on this research see: Plum polyphenols inhibit colorectal aberrant crypt foci formation in rats: potential role of the miR-143/protein kinase B/mammalian

Central Nervous System Diseases and Conditions -…

**Studies from Third Military Medical University Update Current Data on Brain Injuries (MG53 permeates through blood-brain barrier to protect ischemic brain injury)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Central Nervous System Diseases and Conditions - Brain Injuries is the subject of a report. According to news originating from Chongqing, People's Republic of China, by NewsRx correspondents, research stated, "Ischemic injury to neurons represents the underlying cause of stroke to the brain. Our previous studies identified MG53 as an essential component of the cell membrane repair machinery."

Our news journalists obtained a quote from the research from Third Military Medical University, "Here we show that the recombinant human (rh)MG53 protein facilitates repair of ischemia-reperfusion (IR) injury to the brain. MG53 rapidly moves to acute injury sites on neuronal cells to form a membrane repair patch. IR-induced brain injury increases permeability of the blood-brain-barrier, providing access of MG53 from blood circulation to target the injured brain tissues. Exogenous rhMG53 protein can protect cultured neurons against hypoxia/reoxygenation-induced damages. Transgenic mice with increased levels of MG53 in the bloodstream are resistant to IR-induced brain injury. Intravenous administration of rhMG53, either prior to or after ischemia, can effectively alleviate brain injuries in rats, rhMG53-mediated neuroprotection involves suppression of apoptotic neuronal cell death, as well as activation of the pro-survival RISK signaling pathway."

According to the news editors, the research concluded: "Our data indicate a physiological function for MG53 in the brain and suggest that targeting membrane repair or RISK signaling may be an effective means to treat ischemic brain injury."

For more information on this research see: MG53 permeates through blood-brain barrier to protect ischemic brain injury. Oncotarget, 2016;7(16):22474-85.

The news correspondents report that additional information may be obtained from Y.

Oncology - Cancer Risk

Studies from Thomas Jefferson University Describe New Findings in Cancer Risk (Familial prostate cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Cancer Risk. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "Prostate cancer is the most commonly diagnosed cancer among men in the United States as well as most Western countries. A significant proportion of men report having a positive family history of prostate cancer in a first-degree relative (father, brother, son), which is important in that family history is one of the only established risk factors for the disease and plays a role in decision-making for prostate cancer screening."

Our news editors obtained a quote from the research from Thomas Jefferson University, "Familial aggregation of prostate cancer is considered a surrogate marker of genetic susceptibility to developing the disease, but shared environment cannot be excluded as an explanation for clustering of cases among family members. Prostate cancer is both a clinically and genetically heterogeneous disease with inherited factors predicted to account for 40%-50% of cases, comprised of both rare highly to moderately penetrant gene variants, as well as common genetic variants of low penetrance. Most notably, HOXB13 and BRCA2 mutations have been consistently shown to increase prostate cancer risk, and are more commonly observed among patients diagnosed with early-onset disease. A recurrent mutation in HOXB13 has been shown to predispose to hereditary prostate cancer (HPC), and BRCA2 mutations to hereditary breast and ovarian cancer (HBOC). Genome-wide association studies (GWAS) have also identified approximately 100 loci that associate with modest (odds ratios <2.0) increases in prostate cancer risk, only some of which have been replicated in subsequent studies. Despite these efforts, genetic testing in prostate cancer lags behind other common tumors like breast and colorectal cancer. To date, National Comprehensive Cancer Network (NCCN) guidelines have highly selective criteria for BRCA1/2 testing for men with prostate cancer based on personal history and/or specific family cancer history. Tumor sequencing is also leading to the identification of germline mutations in prostate cancer patients, informing the scope of inheritance."

According to the news editors, the research concluded: "Advances in genetic testing for inherited and familial prostate cancer (FPC) are needed to inform personalized cancer risk
screening and treatment approaches."

The news editors report that additional information may be obtained by contacting V.N. Giri, Thomas Jefferson University, Sidney Kimmel Canc Center, Center Excellence Canc Risk Prevent & ControlDept M, Canc Risk Assessment & Clin Canc Genet ProgramDi, Philadelphia, PA 19107, United States.

**Nutritional and Metabolic Diseases and Conditions -...**

**Studies from Toho University School of Medicine Reveal New Findings on Obesity (High-fat diet feeding alters olfactory-, social-, and reward-related behaviors of mice independent of obesity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Obesity. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "High-fat diet (HFD) consumption causes obesity, which is associated with well-known increased health risks. Moreover, obesity has been associated with altered sensorimotor and emotional behaviors of humans and mice."

Financial support for this research came from JSPS KAKENHI.

Our news journalists obtained a quote from the research from the Toho University School of Medicine, "This study attempted to dissociate the influence of HFD-induced obesity on behaviors from the influence of HFD consumption itself. C57BL male mice were randomly allocated to a low-fat diet (LFD) group, an HFD-induced obesity (DIO) group, or a pair-fed HFD-feeding nonobese (HFD) group. A comprehensive behavioral test battery was performed on all three groups to assess sensorimotor functions, anxiety-and depression-like behaviors, reward-related behaviors, social behaviors, and learning/memory functions. Both the DIO and HFD groups exhibited disturbed olfaction, blunted ethanol preference, and enhanced social interactions. The DIO group exhibited blunted sucrose preference, shorter latency before falling off during the rotarod test, and a lower response to mechanical stimuli. The HFD-fed nonobese mice showed altered behaviors related to olfaction, social interactions, and rewards that were similar to those of the DIO mice."

According to the news editors, the research concluded: "This finding suggests that HFD consumption alters a variety of behaviors independent of obesity."

For more information on this research see: High-fat diet feeding alters olfactory-,

The news correspondents report that additional information may be obtained from K. Takase, Dept. of Anatomy, Toho University School of Medicine, Ota-Ku, Tokyo, Japan. Additional authors for this research include Y. Tsuneoka, S. Oda, M. Kuroda and H. Funato.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/oby.21441. This DOI is a link to an online electronic document that is either free or for purchase.

Lung Diseases and Conditions - Pneumococcal...

Studies from Toho University Update Current Data on Pneumococcal Pneumonia (Efficacy of beta-Lactam-plus-Macrolide Combination Therapy in a Mouse Model of Lethal Pneumococcal Pneumonia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lung Diseases and Conditions - Pneumococcal Pneumonia is the subject of a report. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "Community-acquired pneumonia is a common disease with considerable morbidity and mortality, for which Streptococcus pneumoniae is accepted as a leading cause. Although beta-lactam-plus-macrolide combination therapy for this disease is recommended in several guidelines, the clinical efficacy of this strategy against pneumococcal pneumonia remains controversial."

The news correspondents obtained a quote from the research from Toho University, "In this study, we examined the effects of beta-lactam-plus-macrolide combination therapy on lethal mouse pneumococcal pneumonia and explored the mechanisms of action in vitro and in vivo. We investigated survival, lung bacterial burden, and cellular host responses in bronchoalveolar lavage fluids obtained from mice infected with pneumonia and treated with ceftriaxone, azithromycin, or both in combination. Although in vitro synergy was not observed, significant survival benefits were demonstrated with combination treatment. Lung neutrophil influx was significantly lower in the ceftriaxone-plus-azithromycin-treated group than in the ceftriaxone-treated group, whereas no differences in the lung bacterial burden were observed on day 3 between the ceftriaxone-plus-azithromycin-treated group and the ceftriaxone-treated group. Notably, the analysis of cell surface markers in the ceftriaxone-plus-azithromycin combination group exhibited upregulation of presumed immune checkpoint ligand CD86 and major histocompatibility complex class II in neutrophils and CD11b-positive CD11c-positive (CD11b(+) CD11c(+)) macrophages and dendritic cells, as well as downregulation of immune checkpoint receptors cytotoxic-T lymphocyte-associated antigen 4 and programmed death 1 in T helper and T regulatory cells. Our data demonstrate that the survival benefits of ceftriaxoneplus-azithromycin therapy occur through modulation of immune checkpoints in mouse pneumococcal pneumonia."

According to the news reporters, the research concluded: "In addition, immune
checkpoint molecules may be a novel target class for future macrolide research.

For more information on this research see: Efficacy of beta-Lactam-plus-Macrolide Combination Therapy in a Mouse Model of Lethal Pneumococcal Pneumonia. Antimicrobial Agents and Chemotherapy, 2016;60(10):6146-6154. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Oncology - Breast Cancer

Studies from Tohoku Pharmaceutical University Update Current Data on Breast Cancer (Distinct effects of b1 integrin on cell proliferation and cellular signaling in MDA-MB-231 breast cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Breast Cancer is now available. According to news reporting from Miyagi, Japan, by NewsRx journalists, research stated, "An aberrant expression of integrin b1 has been implicated in breast cancer progression. Here, we compared the cell behaviors of wild-type (WT), b1 gene deleted (KO), and b1 gene restored (Res) MDA-MB-231 cells."

The news correspondents obtained a quote from the research from Tohoku Pharmaceutical University, "Surprisingly, the expression of b1 exhibited opposite effects on cell proliferation. These effects were dependent on cell densities, and they showed an up-regulation of cell proliferation when cells were cultured under sparse conditions, and a down-regulation of cell growth under dense conditions. By comparison with WT cells, the phosphorylation levels of ERK in KO cells were consistently suppressed under sparse culture conditions, but consistently up-regulated under dense culture conditions. The phosphorylation levels of EGFR were increased in the KO cells. By contrast, the phosphorylation levels of AKT were decreased in the KO cells. The abilities for both colony and tumor formation were significantly suppressed in the KO cells, suggesting that b1 plays an important role in cell survival signaling for tumorigenesis. These aberrant phenotypes in the KO cells were rescued in the Res cells."

According to the news reporters, the research concluded: "Taken together, these results clearly showed the distinct roles of b1 in cancer cells: the inhibition of cell growth and
the promotion of cell survival, which may shed light on cancer therapies.

For more information on this research see: Distinct effects of b1 integrin on cell proliferation and cellular signaling in MDA-MB-231 breast cancer cells. *Scientific Reports*, 2016;6():18430. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**Adrenal Gland Diseases and Conditions...**

**Studies from Tohoku University Add New Findings in the Area of Adrenocortical Adenoma (Expression of CYP11B2 in Aldosterone-Producing Adrenocortical Adenoma: Regulatory Mechanisms and Clinical Significance)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Adrenal Gland Diseases and Conditions - Adrenocortical Adenoma are presented in a new report. According to news reporting originating from Miyagi, Japan, by NewsRx correspondents, research stated, "Aldosterone-producing adrenocortical adenoma (APA) is responsible for the majority of cases clinically diagnosed as primary aldosteronism. Aldosterone synthase (CYP1162) is one of the enzymes that play essential roles in aldosterone synthesis and is involved in the pathogenesis of APA."

Our news editors obtained a quote from the research from Tohoku University, "Recent studies have demonstrated that various factors and regulators influence the expression and function of CYP11B2 in APA. In particular, somatic mutations, such as gain-of-function and loss-of-function mutations, have been identified in several genes, each of which encodes a pivotal protein that affects the calcium signaling pathway, the expression of CYP11B2, and aldosterone production. The gain-of-function mutations were reported in KCNJ5 that encodes G-protein activated inward rectifier K+ channel 4 (Kir3.4) and in CACNA1D, encoding calcium channel, voltage-dependent, L type, alpha subunit Cav1.3. The loss-of-function mutations were found in ATP1A1 that encodes Na+/K+ ATPase alpha subunit and in ATP2B3, encoding Ca2+ ATPase. Furthermore, the aberrant expression of gonadotropin-releasing hormone receptor is associated with the overexpression of CYP11B2 and overproduction of aldosterone in APA with activating mutations in CTNNB1 encoding beta-catenin. On the other hand, CYP11B2 also catalyzes the conversion of cortisol to 18-hydroxycortisol and subsequently converts 18-hydroxycortisol to 18-oxocortisol. The recent studies have identified 18-oxocortisol as an important and distinct biomarker to diagnose primary aldosteronism."
According to the news editors, the research concluded: "In this review, we summarize the recent findings on CYP11B2 and discuss the molecular pathogenesis of APA and the clinical significance of CYP11B2."

The news editors report that additional information may be obtained by contacting Y. Nakamura, Tohoku University, Grad Sch Med, Dept. of Pathol, Sendai, Miyagi, Japan. Additional authors for this research include Y. Yamazaki, Y. Tezuka, F. Satoh and H. Sasano.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1620/tjem.240.183. This DOI is a link to an online electronic document that is either free or for purchase.

**Immunology - Cytokine Receptors**

**Studies from Tohoku University Further Understanding of Cytokine Receptors [Brefeldin A-Inhibited Guanine Nucleotide-Exchange Factor 1 (BIG1) Governs the Recruitment of Tumor Necrosis Factor Receptor-Associated Factor 2 (TRAF2) to Tumor Necrosis ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunology - Cytokine Receptors. According to news reporting from Miyagi, Japan, by NewsRx journalists, research stated, "Tumor necrosis factor receptor-associated factor 2 (TRAF2) is a critical mediator of tumor necrosis factor-alpha (TNF-alpha) signaling. However, the regulatory mechanisms of TRAF2 are not fully understood."

The news correspondents obtained a quote from the research from Tohoku University. "Here we show evidence that TRAF2 requires brefeldin A-inhibited guanine nucleotide-exchange factor 1 (BIG1) to be recruited into TNF receptor 1 (TNFR1) signaling complexes. In BIG1 knockdown cells, TNF-alpha-induced c-Jun N-terminal kinase (JNK) activation was attenuated and the sensitivity to TNF-alpha -induced apoptosis was increased. Since these trends correlated well with those of TRAF2 deficient cells as previously demonstrated, we tested whether BIG1 functions as an upstream regulator of TRAF2 in TNFR1 signaling. As expected, we found that knockdown of BIG1 suppressed TNF-alpha-dependent ubiquitination of TRAF2 that is required for JNK activation, and impaired the recruitment of TRAF2 to the TNFR1 signaling complex (complex I). Moreover, we found that the recruitment..."
of TRAF2 to the death-inducing signaling complex termed complex II was also impaired in BIG1 knockdown cells. These results suggest that BIG1 is a key component of the machinery that drives TRAF2 to the signaling complexes formed after TNFR1 activation.

According to the news reporters, the research concluded: "Thus, our data demonstrate a novel and unexpected function of BIG1 that regulates TNFR1 signaling by targeting TRAF2."

For more information on this research see: Brefeldin A-Inhibited Guanine Nucleotide-Exchange Factor 1 (BIG1) Governs the Recruitment of Tumor Necrosis Factor Receptor-Associated Factor 2 (TRAF2) to Tumor Necrosis Factor Receptor 1 (TNFR1) Signaling Complexes. *International Journal of Molecular Sciences*, 2016;17(11):1600-1614. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Heart Disorders and Diseases - Heart Attack

**Studies from Tokyo Metropolitan Bokutoh Hospital Provide New Data on Heart Attack (Prognostic effect of estimated glomerular filtration rate in patients with cardiogenic shock or cardiac arrest undergoing percutaneous veno-arterial ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "Veno-arterial extracorporeal membrane oxygenation (VA-ECMO) can improve survival in patients with cardiogenic shock or cardiac arrest. We investigated the association between initial renal function and clinical outcome in patients undergoing VA-ECMO for cardiogenic shock and cardiac arrest."

The news correspondents obtained a quote from the research from Tokyo Metropolitan Bokutoh Hospital, "This was a single-center, retrospective cohort study of 287 patients who underwent ECMO at our hospital from January 2005 to December 2014. We excluded 70 patients with non-cardiogenic events. The remaining 217 patients were divided into 2 groups according to initial estimated glomerular filtration rate (eGFR): Initial high eGFR (non-renal failure: non-RF) group: eGFR >= 60 ml/min/1.73 m(2) (n = 73) and initial low eGFR (RF) group: eGFR < 60 ml/min/1.73 m(2) (n = 144). Clinical outcome was defined as all-cause death at 30 days after extracorporeal life support. VA-ECMO was begun in 87% of patients for cardiogenic shock and cardiac arrest. The non-RF group was significantly younger (51.6 vs. 62.6 years), had lower
body mass index (22.8 vs. 24.7 kg/m(2)), lower blood urea nitrogen (14.4 vs. 23.9 mg/dl), and lower K (4.0 vs. 4.5 mEq/L, all p< 0.05) than the RF group. Incidence of all-cause death at 30 days was significantly lower in the non-RF than RF group (49% vs. 76%, p< 0.0001). Initial low eGFR was an independent predictor of mortality after adjustment for multiple cofounders (OR: 4.08, 95% CI: 1.77-9.42, p< 0.001). Kaplan-Meier curve showed better outcome in the non-RF versus RF group (p = 0.0009)."

According to the news reporters, the research concluded: "An initial low eGFR may predict worse clinical outcome in patients undergoing VA-ECMO for cardiogenic shock and cardiac arrest."

For more information on this research see: Prognostic effect of estimated glomerular filtration rate in patients with cardiogenic shock or cardiac arrest undergoing percutaneous veno-arterial extracorporeal membrane oxygenation. *Journal of Cardiology*, 2016;68(5-6):439-446.

Our news journalists report that additional information may be obtained by contacting D. Abe, Tokyo Metropolitan Bokutoh Hosp, Dept. of Cardiol, Tokyo, Japan. Additional authors for this research include D. Abe, T. Iwama, K. Sugiyama, A. Akashi, Y. Hamabe, K. Aonuma and A. Sato.

**Gram-Positive Bacteria - Staphylococcus epidermidis**

**Studies from Tokyo University of Pharmacy and Life Sciences Reveal New Findings on Staphylococcus epidermidis (Methicillin-Resistant Staphylococcus epidermidis Is Part of the Skin Flora on the Hands of Both Healthy Individuals and Hospital ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Positive Bacteria - Staphylococcus epidermidis are discussed in a new report. According to news originating from Hachioji, Japan, by NewsRx correspondents, research stated, "Staphylococcus epidermidis, a major skin flora on hands, acts as a reservoir of various antimicrobial resistance determinants including staphylococcal cassette chromosome mec (SCCmec) and contributes to multidrug resistance for S. aureus. The aim of this study was understanding the characteristics of commensal S. epidermidis on the hands of hospital workers and healthy individuals."

Our news journalists obtained a quote from the research from the Tokyo University of Pharmacy and Life Sciences, "A total of 23 hospital workers (physicians, nurses, and hospital pharmacists), 13 community pharmacists, and 24 healthy individuals (students) were studied. Commensal bacteria on hands were recovered using a glove-juice method. For methicillin-
resistant S. epidermidis (MRSE), we performed SCCmec typing, pulsed-field gel electrophoresis (PFGE), and determined the antimicrobial susceptibility. The detection rates of MRSE in community pharmacists (92.3%) and students (87.5%) were higher than those in hospital workers (66.7 to 81.8%). SCCmec type IV strains were predominant in both hospital workers and students. PFGE analysis strongly suggested that the MRSE of hospital workers and students were normal inhabitants of each subject. The antimicrobial resistance rates and levels in MRSE of hospital workers were higher than those of students."

According to the news editors, the research concluded: "Our findings showed that MRSE was frequently colonized on the hands of healthy individuals as well as hospital workers."

The news correspondents report that additional information may be obtained from N. Noguchi, Tokyo Univ Pharm & Life Sci. Dept. of Microbiol, Sch Pharm, Hachioji, Tokyo 1920392, Japan. Additional authors for this research include H. Nakaminami, C. Azuma, I. Tanaka, K. Nakase, N. Matsunaga, K. Okuyama, K. Yamada, K. Utsumi, T. Fujii and N. Noguchi.

Truncus Arteriosus

Studies from Tokyo Women's Medical University Have Provided New Data on Truncus Arteriosus (Long-term Outcomes after Truncus Arteriosus Repair: A Single-center Experience for More than 40 Years)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Truncus Arteriosus. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "This study aimed to analyze long-term survival and functional outcomes after truncus arteriosus repair in a single institution with more than 40 years of follow-up. Medical records were analyzed retrospectively in 52 patients who underwent the Rastelli procedure for truncus arteriosus repair between 1974 and 2002."

The news correspondents obtained a quote from the research from Tokyo Women's Medical University, "Thirty-five patients survived the initial repair. The median age at the initial operation was 2.8 months (range, 0.1-123 months) and the body weight was 3.9 kg (range, 1.6 to 15.0 kg). The median age at follow-up was 23.6 years (range, 12.4 to 44.5 years). The median
The follow-up duration was 23.4 years (range, 12.3 to 40.7 years). The actuarial survival rate was 97% at 10 years and 93% at both 20 years and 40 years after the initial operation. At follow-up, most patients were in New York Heart Association (NYHA) functional classes I (73%) and II (24%). Thirty-six percent of patients had full-time jobs, 40% were students, and 21% were unemployed. Most patients (97%) had undergone conduit reoperations. Freedom from reoperation for right ventricular (RV) outflow and pulmonary artery (PA) stenosis was 59% at 5 years, 28% at 10 years, and 3% at 20 years after the initial operation. Freedom from catheter interventions for RV outflow and PA stenosis was 59% at 5 years, 47% at 10 years, and 38% at 20 years after the initial operation. Freedom from truncal valve replacement was 88% at 5 years, 85% at 10 years, and 70% at 20 years after the initial operation.

According to the news reporters, the research concluded: "In this single-center retrospective study, with long-term follow-up after repair of truncus arteriosus, long-term survival and functional outcomes were acceptable, despite the requirement for reoperation and multiple catheter interventions for RV outflow and PA stenosis in almost all patients, and the frequent requirement for late truncal valve operations."

Erythropoiesis

Studies from Tokyo Women's Medical University Have Provided New Information about Erythropoiesis (Modulation of circulating endothelial progenitor cells by erythropoiesis-stimulating agents in patients with chronic kidney disease stage G5 and 5D)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Erythropoiesis are presented in a new report. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Circulating endothelial progenitor cells (EPCs) play a pivotal role in vasculogenesis and promote angiogenesis by secreting growth factors. Recent studies have suggested that erythropoietin (EPO) may accelerate not only angiogenesis but also vasculogenesis, beyond erythropoiesis."

Our news journalists obtained a quote from the research from Tokyo Women's Medical University, "The aim of this study was to investigate whether two erythropoiesis-stimulating agents (ESAs) modulate vascular-related factors and EPC mobilization in patients with chronic kidney disease stage G5 and dialysis (CKD G5 and 5D). We conducted a 12-week
prospective study in 63 patients; 21 patients received recombinant human erythropoietin (rhEPO) (EPO group, 4,565.5 +/- 1,994.4 IU/week), 21 patients received darbepoetin (DA) (DA group, 40.1 +/- 13.8 µg/week), and 21 patients received no ESAs (no-ESA group). Vascular mediators, including EPCs, vascular endothelial growth factor, matrix metalloproteinase-2 (MMP-2), high-sensitivity C-reactive protein, and asymmetric dimethyl arginine, were measured at 0 and 12 weeks. EPCs were measured by flow cytometry as CD45(low)CD34(+) CD133(+) cells. We also performed a subanalysis of dialysis (5D) patients (n = 32) in the three groups. In the EPO group, EPC count increased significantly from 0 to 12 weeks in a dose-dependent manner (r = 0.62, p = 0.005), and the increase was more conspicuous in the subgroup of dialysis 5D patients. In the DA group, the EPC number did not change at 12 weeks. Neither rhEPO nor DA affected the serum levels of the aforementioned biomarkers other than EPC.

According to the news editors, the research concluded: "We speculate that the pleiotropic effects of rhEPO and DA beyond their hematopoietic effects may differ between CKD G5 and 5D patients."

For more information on this research see: Modulation of circulating endothelial progenitor cells by erythropoiesis-stimulating agents in patients with chronic kidney disease stage G5 and 5D. Clinical Nephrology, 2016;86(5):242-252. Clinical Nephrology can be contacted at: Dustri-Verlag Dr Karl Feistle, Bahnhofstrasse 9 Postfach 49, D-82032 Deisenhofen-Muenchen, Germany.

between 1985 and 2014, intramural coronary arteries were detected in 15 of them. Coronary arteries were managed using 2 techniques: the double-button method in 5 patients (with unroofing and trapdoor incision in 1 patient) and the Imai technique in 10 patients. There were 3 hospital deaths and 3 deaths after discharge, 5 of which showed coronary complications. Actual survival and freedom from coronary complications at 15 years were 70% and 67%, respectively, with the Imai technique and 40% and 20%, respectively, with the double-button method. Late coronary intervention was performed for a long intramural coronary artery stenosis in 1 patient who underwent the Imai technique. In the others, late aortography showed good patency of the aortopulmonary window and growth of the coronary pouch after the Imai technique. The Imai technique can be an option for coronary management in the presence of high-risk coronary anatomy, particularly distal intramural coronary artery stenosis and inseparable coronary arteries with an almost single orifice.

According to the news editors, the research concluded: "Adequate neopulmonary artery augmentation must be performed to prevent right ventricular outflow stenosis."

The news correspondents report that additional information may be obtained from H. Koshiyama, Tokyo Women's Medical University, Dept. of Cardiovasc Surg, Tokyo, Japan. Additional authors for this research include M. Nagashima, G. Matsumura, T. Hiramatsu, T. Nakanishi and K. Yamazaki.

**Gram-Positive Bacteria - Staphylococcus aureus**

**Studies from Tripura University in the Area of Staphylococcus aureus Reported (3-Amino-4-aminoximidofurazan derivatives: small molecules possessing antimicrobial and antibiofilm activity against Staphylococcus aureus and Pseudomonas aeruginosa)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Positive Bacteria - Staphylococcus aureus. According to news reporting originating from Agartala, India, by NewsRx correspondents, research stated, "The therapeutic treatment of microbial infections involving biofilm becomes quite challenging because of its increasing antibiotic resistance capacities. Towards this direction, in the present study we have evaluated the antibiofilm property of synthesized 3-amino-4-aminoximidofurazan compounds having polyamine skeleton."

Funders for this research include Indian Council of Medical Research, Department of Biotechnology.

Our news editors obtained a quote from the research from Tripura University, "These
derivatives were synthesized by incorporating furazan and biguanide moieties. Different 3-amino-4-aminoximidofurazan derivatives (PI1-4) were synthesized via protic acid catalysis and subsequently characterized by (1) H NMR and (13) C NMR spectra, recorded at 400 and 100 MHz respectively. We have tested the antimicrobial and antibiofilm activities of these synthetic derivatives (PI1-4) against both Staphylococcus aureus and Pseudomonas aeruginosa. The compounds so tested were also compared with standard antibiotics namely Tobramycin (Ps. aeruginosa) and Azithromycin (Staph. aureus) which were used as a positive control in all experimental sets. All these compounds (PI1-4) exhibited moderate to significant antimicrobial activities against both micro-organisms wherein compound PI3 showed maximum activity. Biofilm inhibition of both micro-organisms was then evaluated by crystal violet and safranin staining, estimation of biofilm total protein and microscopy methods using sub-MIC dose of these compounds. Results showed that all compounds executed anti biofilm activity against both Staph. aureus and Ps. aeruginosa wherein compound PI3 exhibited maximum activity. In relation with microbial biofilm inhibition, we have observed reduction in bacterial motility, proteolytic activity and secreted exo-polysaccharide (EPS) from both Staph. aureus and Ps. aeruginosa when they were grown in presence of these compounds. While addressing the issue of toxicity on host, we have observed that these molecules exhibited minimum level of R.B.C degradation. These findings establish the antibacterial and anti biofilm properties of 3-amino-4-aminoximidofurazan derivatives (PI1-4)."

According to the news editors, the research concluded: "Therefore, our current findings demonstrate that 3-amino-4-aminoximidofurazan derivatives (PI1-4) may hold promise to be effective biofilm and microbial inhibitors that may be clinically significant." For more information on this research see: 3-Amino-4-aminoximidofurazan derivatives: small molecules possessing antimicrobial and antibiofilm activity against Staphylococcus aureus and Pseudomonas aeruginosa. Journal of Applied Microbiology, 2016;120(4):842-59. (Wiley-Blackwell - www.wiley.com/; Journal of Applied Microbiology - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1365-2672)

Central Nervous System Diseases and Conditions - …

Studies from Triserv General Hospital Further Understanding of Bacterial Meningitis (Acute lethargy in a young woman due to latent disseminated cancer mimicking bacterial meningitis: a diagnostic pitfall)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Bacterial Meningitis. According to news reporting originating in Taipei, Taiwan, by NewsRx journalists, research stated, "Leptomeningeal carcinomatosis is an atypical behavior of cancer as a consequence of infiltration of malignant cells into the leptomeninges. Leptomeningeal carcinomatosis may share similar clinical manifestations with other etiologies involving the leptomeninges such as infectious meningitis or meningoencephalitis."

The news reporters obtained a quote from the research from Triserv General Hospital, "We present a diagnostic pitfall of acute leptomeningeal carcinomatosis from a latent gastric cancer in a 28-year-old woman presenting with being rapidly comatose and an initial misdiagnosis of bacterial meningitis. This case report aims to raise red flags suggesting that when progressive neurological deterioration mimicking infectious meningitis but with poor responses to empirical antimicrobial therapy are encountered in healthy young individuals, the rare possibility of leptomeningeal carcinomatosis should be considered in the differential diagnosis even if patients have no known malignancy."

According to the news reporters, the research concluded: "Cerebrospinal fluid cytology along with gadolinium enhancement magnetic resonance imaging may be critical in the timely diagnosis and management of these patients with overlapping clinical features."

Our news correspondents report that additional information may be obtained by contacting T.H. Ho, Triserv Gen Hosp, Dept. of Neurol, Natl Def Med Center, Taipei 114, Taiwan. Additional authors for this research include F.C. Yang, H.W. Kao, S.J. Chen, J.T. Lee, L.W. Wen, H.C. Chu and J.C. Lin.

Hemangiopericytomas

Studies from Tufts Medical Center Yield New Information about Hemangiopericytomas (Surgical resection of sinonasal hemangiopericytoma involving anterior skull base: Case reports and literature review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hemangiopericytomas are discussed in a new report. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Hemangiopericytomas are soft tissue tumors composed of pericytic cells that are characterized by their 'staghom' vascular branching and their variable clinical presentation. Fifteen to 25% of all HPC occur in the head and neck, with only 5% found in the nose or paranasal sinuses."

Our news editors obtained a quote from the research from Tufts Medical Center, "Sinonasal hemangiopericytoma (SNHPC) is considered distinct from its soft tissue counterpart - the former showing a more uniform cellular organization; has convincing pericytic differentiation and is associated with a far better prognosis. With less than 200 cases of SNHPC reported in the literature, only limited assumptions can be made about this rare tumor. The purpose of this article is to add to the growing body of literature on this disease. We report two new cases of SNHCP - both in female patients who presented with epistaxis and anosmia. Pulsatile vascular masses were visualized with nasal endoscopy - one in the left middle meatus and the second one near the cribriform plate. CT and MRI studies show enhancing masses in the left nasal cavities with thinning and erosion of the skull base. Diagnoses were confirmed by pathology which reported spindle cell neoplasm staining positively for VEGF, NSE, factor XIIIa, S-100 protein, and CD34, and negative for actin, desmin, CD31, and pankeratin, consistent with hemangiopericytoma. In one patient, embolization of the sphenopalatine and labial artery as well as pre-operative radiation therapy was performed before complete endoscopic resection was undertaken. The second patient had a tumor invading the skull base, so a craniofacial resection was performed. Both patients remained free of disease two years after surgery."

According to the news editors, the research concluded: "Review of the literature and treatment options are discussed."

The news editors report that additional information may be obtained by contacting E.E. Rebeiz, Tufts Med Center, Dept. of Otolaryngol Head & Neck Surg, Boston, MA, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.amjoto.2016.09.003. This DOI is a link to an online electronic document that is either free or for purchase.

Studies from Tulane University Have Provided New Information about Blood Pressure (Effects of early blood pressure reduction on cognitive function in patients with acute ischemic stroke)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Blood Pressure. According to news reporting out of New Orleans, Louisiana, by NewsRx editors, research stated, "The effect of early blood pressure reduction on cognitive function in patients with acute ischemic stroke remains unknown. We tested whether antihypertensive treatment would reduce cognitive impairment in patients with acute ischemic stroke."

Our news journalists obtained a quote from the research from Tulane University, "In the China Antihypertensive Trial in Acute Ischemic Stroke, patients with elevated blood pressure were randomly assigned to receive antihypertensive treatment or to discontinue all hypertensive medications within 48 h of onset. Cognitive function was measured by the Mini-Mental State Examination and Montreal Cognitive Assessment at 3 months after randomization in a subsample of 638 participants. Mean systolic blood pressure was reduced by 21.5mmHg in the antihypertensive treatment group and 13.9mmHg in the control group within 24 h after randomization (P < 0.001). Mean systolic blood pressure was 134.9mmHg in the antihypertensive treatment group and 141.6mmHg in the control group at day 14 after randomization (P < 0.001). Median Mini-Mental State Examination score was 26 and Montreal Cognitive Assessment score was 22 in both the antihypertensive treatment and control groups at 3 months. An Mini-Mental State Examination < 24 was present in 30.9% of patients in the antihypertensive treatment group compared with 29.7% in the control group (odds ratio = 1.06; 95% confidence interval 0.75-1.48; P = 0.75). Likewise, proportions of patients with Montreal Cognitive Assessment < 26 were similar between the antihypertensive treatment (70.6%) and control (70.7%) groups (odds ratio = 0.99; 95% confidence interval 0.70-1.40; P = 0.96)."

According to the news editors, the research concluded: "These data indicated that early blood pressure reduction with antihypertensive medication in patients with acute ischemic stroke had no effect on cognitive impairment at 3 months."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/174749301666009. This DOI is a link to an online electronic document that is either free or for purchase.
Oncology - Acute Myeloid Leukemia

Studies from U. Reusch and Colleagues Yield New Information about Acute Myeloid Leukemia [Characterization of CD33/CD3 Tetravalent Bispecific Tandem Diabodies (TandAbs) for the Treatment of Acute Myeloid Leukemia]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Acute Myeloid Leukemia have been presented. According to news reporting out of San Francisco, California, by NewsRx editors, research stated, "Randomized studies with gemtuzumab ozogamicin have validated CD33 as a target for antigen-specific immunotherapy of acute myelogenous leukemia (AML). Here, we investigated the potential of CD33/CD3-directed tandemdiabodies (TandAbs) as novel treatment approach for AML."

Our news journalists obtained a quote from the research, "These tetravalent bispecific antibodies provide two binding sites for each antigen to maintain the avidity of a bivalent antibody and have a molecular weight exceeding the renal clearance threshold, thus offering a longer half-life compared to smaller antibody constructs. We constructed a series of TandAbs composed of anti-CD33 and anti-CD3 variable domains of diverse binding affinities and profiled their functional properties in CD33(+) human leukemia cell lines, xenograft models, and AML patient samples. Our studies demonstrated that several CD33/CD3 TandAbs could induce potent, dose-dependent cytolysis of CD33(+) AML cell lines. This effect was modulated by the effector-to-target cell ratio and strictly required the presence of T cells. Activation and proliferation of T cells and maximal AML cell cytolysis correlated with high avidity to both CD33 and CD3. High-avidity TandAbs were broadly active in primary specimens from patients with newly diagnosed or relapsed/refractory AML in vitro, with cytotoxic properties independent of CD33 receptor density and cytogenetic risk. Tumor growth delay and inhibition were observed in both prophylactic and established HL-60 xenograft models in immunodeficient mice. Our data show high efficacy of CD33/CD3 TandAbs in various preclinical models of human AML."

According to the news editors, the research concluded: "Together, these findings support further study of CD33/CD3 TandAbs as novel immunotherapeutics for patients with AML."

For more information on this research see: Characterization of CD33/CD3 Tetravalent Bispecific Tandem Diabodies (TandAbs) for the Treatment of Acute Myeloid Leukemia. Clinical Cancer Research, 2016;22(23):5829-5838. Clinical Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Studies from U. Salvadori and Colleagues Provide New Data on Iron-Deficiency Anemia (Ferric carboxymaltose reduces the number of red blood cell units transfused and allows transfusion independence to be obtained in patients with iron deficiency ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Iron-Deficiency Anemia. According to news originating from Bozen Bolzano, Italy, by NewsRx correspondents, research stated, "The aim of this study was to evaluate the effectiveness of ferric carboxymaltose (FCM) in patients with iron deficiency anemia (IDA) secondary to gastrointestinal chronic blood loss (CBL), who received chronic transfusion support. We retrospectively evaluated 38 patients with IDA (hemoglobin [Hb] < 10 g/dL and ferritin < 12 ng/mL or transferrin saturation [TSAT] < 16%) refractory or intolerant to oral iron therapy that necessitated transfusion support in the previous 12 months."

Our news journalists obtained a quote from the research, "They were treated with FCM (500-2500 mg). The primary endpoint was to evaluate the reduction of transfusion requirements (red blood cell [RBC] units) after FCM treatment. The median age of the cohort was 78 years, with a male: female ratio of 22:16. Before FCM treatment a median of 6 RBC units had been transfused. At the treatment (T0) the median value of Hb was 8.7 g/dL, the TSAT 6%, and ferritin 12 ng/mL. The median FCM dose was 1000 mg. At 5 weeks from T0 the median Hb level was 11 g/dL, with a median increase of 2.4 g/dL. With a median follow-up of 326 days, the median transfusion requirement was 0 RBC units, significantly lower than before T0 (p < 0.001). Overall 17 patients still necessitated transfusion support. Twenty-three patients needed retreatment with FCM for recurrence of IDA: 10 of them obtained a response again. The percentage of transfusion-independent patients at median follow-up was equal to 52%." According to the news editors, the research concluded: "In patients with IDA secondary to CBL, FCM significantly reduces the need of transfusions and achieves transfusion independence in half of the cases."

For more information on this research see: Ferric carboxymaltose reduces the number of red blood cell units transfused and allows transfusion independence to be obtained in patients with iron deficiency anemia secondary to gastrointestinal chronic blood loss. Transfusion, 2016;56(11):2720-2726. Transfusion can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-Blackwell - www.wiley.com/; Transfusion -

**Drugs and Therapies - Anxiolytics Sedatives and Hypnotics**

**Studies from UFRGS Add New Findings in the Area of Anxiolytics Sedatives and Hypnotics (Prolonged Infusion of Dexmedetomidine in Critically-ill Children)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Anxiolytics Sedatives and Hypnotics. According to news originating from Porto Alegre, Brazil, by NewsRx correspondents, research stated, "To describe main indications, doses, length of infusion and side effects related to dexmedetomidine infusion. Observational and retrospective study evaluating dexmedetomidine use in pediatric intensive care unit."

Our news journalists obtained a quote from the research from UFRGS, "77 children received dexmedetomidine infusion longer than 6 hours for mechanical ventilation weaning (32.5%), post-neurosurgery and post-upper airway surgery (24.7%), non-invasive ventilation (13%), refractory tachycardia (6.5%) and other causes (23.3%). After 6 hours of infusion, significant decrease in mean arterial pressure and heart rate was observed in all groups. Six children (8%) required withdrawal of drug because of possible side effects: hypotension, bradycardia and somnolence."

According to the news editors, the research concluded: "Dexmedetomidine may be used as sedative in critically ill children without much side effects."

For more information on this research see: Prolonged Infusion of Dexmedetomidine in Critically-ill Children. *Indian Pediatrics*, 2016;53(11):987-989. *Indian Pediatrics* can be contacted at: Springer India, 7TH Floor, Vijaya Building, 17, Barakhamba Road, New Delhi, 110 001, India. (Springer - www.springer.com; Indian Pediatrics - www.springerlink.com/content/0019-6061/)

Studies from Umea University in the Area of Anxiolytics Sedatives and Hypnotics Described (Home alone-The effects of isolation on uptake of a pharmaceutical contaminant in a social fish)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Anxiolytics Sedatives and Hypnotics. According to news reporting originating from Umea, Sweden, by NewsRx correspondents, research stated, "A wide range of biologically active pharmaceutical residues is present in aquatic systems worldwide. As uptake potential and the risk of effects in aquatic wildlife are directly coupled, the aim of this study was to investigate the relationships between stress by isolation, uptake and effects of the psychiatric pharmaceutical oxazepam in fish."

Our news editors obtained a quote from the research from Umea University, "To do this, we measured cortisol levels, behavioral stress responses, and oxazepam uptake under different stress and social conditions, in juvenile perch (Percafluviatilis) that were either exposed (1.03 μg l(-1)) or not exposed to oxazepam. We found single exposed individuals to take up more oxazepam than individuals exposed in groups, likely as a result of stress caused by isolation. Furthermore, the bioconcentration factor (BCF) was significantly negatively correlated with fish weight in both social treatments. We found no effect of oxazepam exposure on body cortisol concentration or behavioral stress response. Most laboratory experiments, including standardized bioconcentration assays, are designed to minimize stress for the test organisms, however wild animals experience stress naturally."

According to the news editors, the research concluded: "Hence, differences in stress levels between laboratory and natural environments can be one of the reasons why predictions from artificial laboratory experiments largely underestimate uptake of oxazepam, and other pharmaceuticals, in the wild."

For more information on this research see: Home alone-The effects of isolation on uptake of a pharmaceutical contaminant in a social fish. Aquatic Toxicology, 2016;180():71-77. Aquatic Toxicology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Studies from University College Reveal New Findings on Retinitis Pigmentosa (Variant haploinsufficiency and phenotypic non-penetrance in PRPF31-associated retinitis pigmentosa)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Eye Diseases and Conditions - Retinitis Pigmentosa. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "Retinitis pigmentosa (RP) is a genetically heterogenous group of inherited disorders, characterized by death of the retinal photoreceptor cells, leading to progressive visual impairment. One form of RP is caused by mutations in the ubiquitously expressed splicing factor, PRPF31, this form being known as RP11."

The news reporters obtained a quote from the research from University College, "An intriguing feature of RP11 is the presence of non-penetrance, which has been observed in the majority of PRPF31 mutation-carrying families. In contrast to variable expressivity, which is highly pervasive, true non-penetrance is a very rare phenomenon in Mendelian disorders. In this article, the molecular mechanisms underlying phenotypic non-penetrance in RP11 are explored."

According to the news reporters, the research concluded: "It is an elegant example of how our understanding of monogenic disorders has evolved from studying only the disease gene, to considering a mutation on the genetic background of the individual - the logical evolution in this genomic era."

Our news correspondents report that additional information may be obtained by contacting A.M. Rose, UCL Inst Ophthalmol, Dept. of Genet, London EC1V 9EL, United Kingdom.

Mesotheliomas

Studies from University Health Network in the Area of Mesotheliomas Reported (SORORIN and PLK1 as potential therapeutic targets in malignant pleural mesothelioma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Mesotheliomas is now available. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated,
"Malignant pleural mesothelioma (MPM) is an aggressive type of cancer of the thoracic cavity commonly associated with asbestos exposure and a high mortality rate. There is a need for new molecular targets for the development of more effective therapies for MPM."

Our news editors obtained a quote from the research from University Health Network, "Using quantitative reverse-transcriptase polymerase chain reaction (qRT-PCR) and an RNA interference-based screening, we examined the SORORIN gene as potential therapeutic targets for MPM in addition to the PLKI gene, which is known for kinase of SORORIN. Following in vitro investigation of the effects of target silencing on MPM cells, cell cycle analyses were performed. SORORIN expression was analyzed immunohistochemically using a total of 53 MPM samples on tissue microarray. SORORIN was found to be overexpressed in the majority of clinical MPM samples and human MPM cell lines as determined by qRT-PCR. Gene suppression of each SORORIN and PLK1 led to growth inhibition in MPM cell lines. Knockdown of SORORIN showed an increased number of G2M-phase population and a larger nuclear size, suggesting mitotic arrest. High expression of SORORIN (SORORIN-H) was found in 50.9% of all the MPM cases, and there is a tendency towards poorer prognosis for the SORORIN-H group but the difference is not significant. Suppression of SORORIN with PLK1 inhibitor BI 6727 showed a combinational growth suppressive effect on MPM cell growth."

According to the news editors, the research concluded: "Given high-dose PLK1 inhibitor induced drug-related adverse effects in several clinical trials, our results suggest inhibition SORORIN-PLK1 axis may hold promise for the treatment of MPMs."

For more information on this research see: SORORIN and PLK1 as potential therapeutic targets in malignant pleural mesothelioma. International Journal of Oncology, 2016;49(6):2411-2420. International Journal of Oncology can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

consequences of off-label antiretroviral (ARV) use in an HIV-infected paediatric cohort."

Our news journalists obtained a quote from the research from University Hospital 12 de Octubre, "In this multicentre cohort study involving 318 HIV-infected children and adolescents from the Madrid Cohort, all off-label prescriptions from March 1988 to March 2012 were recorded from the clinical records. The reasons for prescribing ARV off-label, the side effects and the consequences of incorrect dosing of ARVs are discussed. Among the 318 patients of the cohort, 221 (69%) received off-label ARVs according to EMA licensing at the time of prescription, representing 23% (540) of the 2,353 prescribed ARVs. The main reason for starting an off-label drug was treatment failure. Adverse events led to treatment discontinuation in 12% of the prescriptions. Problems taking the drug led to withdrawal in 5%, more likely when formulation was not suitable for age (P <0.05). Up to 10% were overdosed and 10% underdosed, defined as 25% above or below the current recommended dose, respectively. Treatment failure occurred significantly more frequently among underdosed compared to overdosed patients (50% versus 26%; P<0.05). Off-label use of ARVs was common in our HIV-1 paediatric patients. Adverse events were common but rarely led to withdrawal. Suitable formulation is important in younger children."

According to the news editors, the research concluded: "Pharmacokinetic studies are needed as frequent incorrect dosing may occur when prescribing off-label and underdosing may lead to treatment failure."

The news correspondents report that additional information may be obtained from E. Fernandez-Cooke, Hospital 12 Octubre, Dept. of Pedi at, Madrid, Spain. Additional authors for this research include P. Rojas, A. Holguin, M.I.G. Tome, S.J. de Ory, M.J. Mellado, M.L. Navarro, P. Rojo and J.T. Ramos.

Keywords for this news article include: Madrid, Spain, Europe, Viral Sexually Transmitted Diseases and Conditions, Immune System Diseases and Conditions, Primate Lentiviruses, Vertebrate Viruses, Antiretrovirals, HIV Infections, Retroviridae, RNA Viruses, Pediatrics, HIV/AIDS, University Hospital 12 de Octubre.

Cardiovascular Research

Studies from University Hospital Describe New Findings in Cardiovascular Research (Effects of perinatal, late foetal, and early embryonic insults on the cardiovascular phenotype in experimental animal models and humans)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Research. According to news reporting from Lausanne, Switzerland, by NewsRx journalists, research stated, "Cardiovascular diseases are the main cause of mortality and morbidity in Western countries, but the underlying mechanisms are still poorly understood. Genetic polymorphisms, once thought to represent a major determinant of cardiovascular risk, individually and collectively,
only explain a tiny fraction of phenotypic variation and disease risk in humans."

The news correspondents obtained a quote from the research from University Hospital, "It is now clear that non-genetic factors, i.e., factors that modify gene activity without changing the DNA sequence and that are sensitive to the environment can cause important alterations of the cardiovascular phenotype in experimental animal models and humans. Here, we will review recent studies demonstrating that distinct pathological events during the perinatal (transient perinatal hypoxemia), late foetal (preeclampsia), and early embryonic (assisted reproductive technologies) periods induce profound alterations of the cardiovascular phenotype in humans and experimental animals."

According to the news reporters, the research concluded: "Moreover, we will provide evidence that epigenetic modifications are contributing importantly to this problem and are conferring the potential for its transmission to subsequent generations."

Our news journalists report that additional information may be obtained by contacting C. Sartori, CHU Vaudois, Lausanne, Switzerland. Additional authors for this research include E. Rexhaj, S.F. Rimoldi, U. Scherrer and C. Sartori.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1024/0301-1526/a000573. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Lymphoma**

**Studies from University Hospital Further Understanding of Lymphoma (Dynamics of occurrence of refractory coeliac disease and associated complications over 25 years)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Lymphoma are discussed in a new report. According to news reporting originating from Vienna, Austria, by NewsRx correspondents, research stated, "Refractory coeliac disease, enteropathy associated T-cell lymphoma and small bowel adenocarcinoma are rare but prognostically important complications in coeliac disease. To analyse potential changes in occurrence of complicated coeliac disease over the last 25 years."

Our news editors obtained a quote from the research from University Hospital, "One thousand one hundred and thirty eight patients were included and evaluated based on their time of first presentation at the Medical University of Vienna, Austria. Occurrences of refractory coeliac disease and associated malignancies were evaluated for 5-year intervals from January 1990 until December 2014 and were compared over time. Results' 2.6% (n = 29) were
diagnosed with refractory coeliac disease (females 65.6%, mean age at diagnosis 62.8 years). The proportion of those patients was 2.6%, 3.1%, 3.3%, 2.7% and 0.5% for the 5 year intervals from 1990 onwards. Thus, the number of refractory cases has been decreasing since 2000 (P = 0.024). The number of patients presenting with lymphoma (n = 7) was 0.6%, 0.4%, 1.1%, 0.8% and 0% from 1990 to 2014. Similarly the number of patients with adenocarcinoma (n = 4) decreased to 0% until 2014. Overall mortality in patients suffering from refractory disease was 48%. Of all patients diagnosed with lymphoma 71.4% died with a 5-year survival rate of 28.6%. Over the past 15 years the occurrence of complicated coeliac disease has been decreasing. This possibly reflects a higher awareness of coeliac disease and optimised diagnosis and treatment with avoidance of long-term immunological disease activity."

According to the news editors, the research concluded: "Symptomatic disease and a delay in diagnosis are risk factors for refractory coeliac disease and related cancer."

The news editors report that additional information may be obtained by contacting W. Eigner, Medical Univ Hosp Vienna, Dept. of Internal Med 3, Div Gastroenterol & Hepatol, A-1090 Vienna, Austria. Additional authors for this research include K. Bashir, C. Primas, L. Kazemi-Shirazi, F. Wrba, M. Trauner and H. Vogelsang.

Keywords for this news article include: Vienna, Austria, Europe, Coeliac Disease, Diagnostics and Screening, Risk and Prevention, Lymphatic Diseases and Conditions, Immunoproliferative Disorders, Lymphoproliferative Disorders, Hematology, Lymphomas, Oncology, University Hospital.

**Peptide Proteins - Parathyroid Hormone**

**Studies from University Hospital Have Provided New Data on Parathyroid Hormone (Effects of teriparatide on bone mineral density and quality of life in Duchenne muscular dystrophy related osteoporosis: a case report)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Peptide Proteins - Parathyroid Hormone. According to news reporting from Messina, Italy, by NewsRx journalists, research stated, "Duchenne muscular dystrophy (DMD) is an X-linked recessive muscle disease characterized by secondary osteoporosis and increased fractures. We describe the case of a 20-year-old boy with DMD suffering from back pain due to multiple vertebral fractures who was treated with teriparatide."

The news correspondents obtained a quote from the research from University Hospital, "Improvement of bone density, pain, and quality of life was achieved. DMD is an X-linked recessive muscle disease with secondary osteoporosis and related frequently occurring fractures. To date, only bisphosphonates have been used to treat osteoporosis in DMD. Black
bear parathyroid hormone has been previously reported to enhance bone mass in the dystrophin-deficient mouse. This study reports the positive effect of osteoanabolic treatment with once-daily recombinant human parathyroid hormone 1-34 (rhPTH 1-34, teriparatide) in a 20-year-old DMD boy suffering from multiple vertebral fractures causing back pain. Bone formation and resorption markers (osteocalcin and C-telopeptide of type I collagen, respectively), as expected, increased within 6 months and intensity of back pain early decreased, with no pain reported after 6 months at visual analog scale. Over a 18-month period of treatment with teriparatide, bone mineral density and quality of life, assessed by the 36-item short-form questionnaire, considerably improved and no side effects were reported."

According to the news reporters, the research concluded: "Further studies on large cohorts are warranted to test the efficacy of this promising treatment for DMD related osteoporosis."

Our news journalists report that additional information may be obtained by contacting A. Catalano, Univ Hosp Messina, Dept. of Clin & Expt Med, I-98125 Messina, Italy. Additional authors for this research include G.L. Vita, M. Russo, G. Vita, A. Lasco, N. Morabito and S. Messina.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s00198-016-3761-x. This DOI is a link to an online electronic document that is either free or for purchase.

Nutritional and Metabolic Diseases and Conditions...

Studies from University Hospital Have Provided New Information about Iron-Deficiency Anemia (Outcome of endoscopy-negative iron deficiency anemia in patients above 65 A longitudinal multicenter cohort)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Iron-Deficiency Anemia. According to news reporting out of Strasbourg, France, by NewsRx editors, research stated, "After the age of 65 years, iron deficiency anemia (IDA) requires the elimination of digestive neoplasia and is explored with upper and lower gastrointestinal (GI) endoscopy. However, such explorations are negative in 14% to 37% of patients."

Our news journalists obtained a quote from the research from University Hospital, "To further evaluate this issue, we evaluated the outcomes of patients aged over 65 years with endoscopy-negative IDA. We retrospectively analyzed the outcomes of in-patients over the age
of 65 years with IDA (hemoglobin <12 g/dL and ferritin <70 mg/L) who had negative complete upper and lower GI endoscopies in 7 tertiary medical hospitals. Death, the persistence of anemia, further investigations, and the final diagnosis for IDA were analyzed after at least 12 months by calling the patients' general practitioners and using hospital records. Between 2004 and 2011, 69 patients (74% women) with a median age of 78 (interquartile range (IQR) 75-82) years and hemoglobin and ferritin levels of 8.4 (IQR 6.8-9.9) g/dL and 14 (IQR 8-27) mg/L, respectively, had endoscopy-negative IDA, and 73% of these patients received daily antithrombotics. After a follow-up of 41 +/- 22 months, 23 (33%) of the patients were dead; 5 deaths were linked with the IDA, and 45 (65%) patients had persistent anemia, which was significantly associated with death (P=0.007). Further investigations were performed in 45 patients; 64% of the second-look GI endoscopies led to significant changes in treatment compared with 25% for the capsule endoscopies. Conventional diagnoses of IDA were ultimately established for 19 (27%) patients and included 3 cancer patients. Among the 50 other patients, 40 (58%) had antithrombotics. In endoscopy-negative IDA over the age of 65 years, further investigations should be reserved for patients with persistent anemia, and second-look GI endoscopy should be favored."

According to the news editors, the research concluded: "If the results of these investigations are negative, the role of antithrombotics should be considered."

For more information on this research see: Outcome of endoscopy-negative iron deficiency anemia in patients above 65 A longitudinal multicenter cohort. *Medicine*, 2016;95 (47):107-112. *Medicine* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

Our news journalists report that additional information may be obtained by contacting R. Clere-Jehl, Univ Hosp Strasbourg, Internal Med Endocrinol & Nutr Department, Hautepierre Hosp, Strasbourg, France. Additional authors for this research include E. Sauleau, S. Ciucu, M. Schaeffer, A. **Oncology - Breast Cancer**

**Studies from University Hospital Provide New Data on Breast Cancer (Exogenous FABP4 increases breast cancer cell proliferation and activates the expression of fatty acid transport proteins)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting originating from Reus, Spain, by NewsRx correspondents, research stated, "Adipose tissue plays an important role in tumor progression, because it provides nutrients and adipokines to proliferating cells. Fatty acid binding protein 4 (FABP4) is a key adipokine for fatty acid transport."
Our news editors obtained a quote from the research from University Hospital, "In metabolic pathologies, plasma levels of FABP4 are increased. However, the role of this circulating protein is unknown. Recent studies have demonstrated that FABP4 might have a role in tumor progression, but the molecular mechanisms involved are still unclear. In this study, we analysed the role of eFABP4 (exogenous FABP4) in breast cancer progression. MCF-7 and MDA-MB-231 breast cancer cells did not express substantial levels of FABP4 protein, but intracellular FABP4 levels increased after eFABP4 incubation. Moreover, eFABP4 enhanced the proliferation of these breast cancer cells but did not have any effect on MCF-7 and MDA-MB-231 cell migration. Additionally, eFABP4 induced the AKT and MAPK signaling cascades in breast cancer cells, and the inhibition of these pathways reduced the eFABP4-mediated cell proliferation. Interestingly, eFABP4 treatment in MCF-7 cells increased levels of the transcription factor FoxM1 and the fatty acid transport proteins CD36 and FABP5."

According to the news editors, the research concluded: "In summary, we showed that eFABP4 plays a key role in tumor proliferation and activates the expression of fatty acid transport proteins in MCF-7 breast cancer cells."

The news editors report that additional information may be obtained by contacting S. Guaita-Esteruelas, St Joan Univ Hosp, IOCS, Oncol Res Grp, Reus, Spain. Additional authors for this research include A. Bosquet, P. Saavedra, J. Guma, J. Girona, E.W.F. Lam, K. Amillano, J. Borras and L. Masana.

Keywords for this news article include: Reus, Spain, Europe, Fatty Acid Transport Proteins, Membrane Transport Proteins, Cell Proliferation, Carrier Proteins, Women's Health, Breast Cancer, Oncology, Genetics, University Hospital.

**Oncology - Ewing Sarcoma**

**Studies from University Hospital Provide New Data on Ewing Sarcoma (Primary Epidural Lumbar Ewing Sarcoma: Case Report and Review of the Literature)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Ewing Sarcoma have been published. According to news reporting originating from Madrid, Spain, by NewsRx correspondents, research stated, "Case report. We present a case of isolated primary epidural lumbar Ewing sarcoma and review the current literature on the standard management."

Our news editors obtained a quote from the research from University Hospital, "We also propose laminoplasty as safe procedure in this patient population that can provide good stabilization in young people. Primary epidural Ewing's sarcoma is a very rare entity. The best generally accepted treatment option in sarcomas is to achieve a gross total resection with safe margins followed by local radiotherapy and chemotherapy. A total resection with safe margins is
a great challenge in neurosurgical patients. We present a previously healthy 17-year-old girl who complained of right sciatica with an epidural lumbar mass at L3-L4. She underwent complete resection of the tumor and a laminoplasty, which, in our experience, is a good way to preserve stability. At surgery, an isolated and noninvasive lesion was identified. Histopathological confirmation of Ewing sarcoma was obtained by immunohistochemical study and EWSR1 gene rearrangement detection. Treatment with 6 months of chemotherapy resulted in no further identifiable lesions by PET and MRI imaging at 4 years postsurgery. The laminoplasty has remained stable. Primary epidural Ewing sarcoma is extremely rare. The detection of the EWSR1 gene rearrangement can help to diagnose these tumors. The decision on how to treat these patients is difficult and can hardly be based on data from the current literature because of the small number of patients."

According to the news editors, the research concluded: "The laminoplasty procedure can be safely performed in the setting of sarcoma of the epidural space."

For more information on this research see: Primary Epidural Lumbar Ewing Sarcoma: Case Report and Review of the Literature. *Spine*, 2016;41(6):E375-8. (Lippincott Williams and Wilkins - www.lww.com; Spine - journals.lww.com/spinejournal/pages/default.aspx)

The news editors report that additional information may be obtained by contacting J. Giner, *Dept. of Neurosurgery, University Hospital La Paz, Madrid, Spain †Dept. of Oncology, University Hospital Puerta de Hierro, Madrid, Spain ‡Dept. of Pathology, University Hospital Puerta de Hierro, Madrid, Spain. **Oncology - Multiple Myeloma**

**Studies from University Hospital Provide New Data on Multiple Myeloma**

*(Clinical features and survival of 338 multiple myeloma patients treated with hematopoietic stem cell transplantation or conventional chemotherapy)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Multiple Myeloma are discussed in a new report. According to news reporting originating in Murcia, Spain, by NewsRx journalists, research stated, "Therapeutic approaches against multiple myeloma (MM) have largely changed during the past decade. Hematopoietic stem cell transplantation (HSCT) and licensing of immunomodulators and proteasome inhibitors have resulted in better response and increased overall survival rates compared to previous conventional therapies."

Financial support for this research came from Celgene.

The news reporters obtained a quote from the research from University Hospital, "To assess the impact that these new strategies have had on outcome of patients with symptomatic
MM in Spain, we conducted an epidemiological retrospective analysis of 338 newly diagnosed patients with stage II-III MM who started first-line treatment over a 2-yr period (2003-2005) by collecting data from their medical records. Most patients had been diagnosed with secretory MM (94.4%), 41.7% stage II and 58.3% stage III. The presence of bone lesions (72.2%), as well as anemia (79.8%) and elevated beta2-microglobulin levels (62.3%), was a common finding; in contrast, hypercalcemia and elevated serum creatinine were less frequent (25% each). First-line treatment had consisted of either conventional chemotherapy (62%) or induction treatment plus autologous HSCT (38%), as per standard clinical practice. HSCT not only resulted in greater objective response rates (93% vs. 50%), but also contributed to a significant increase in 3-yr survival (85% vs. 49.7%; 95% CI, range 77-91 vs. 41-58; p<0.001). Overall, 55% of patients presented treatment-related adverse events, mainly hematological. Toxicity rates were higher among patients treated with alkylating-based regimens and in those undergoing transplantation.

According to the news reporters, the research concluded: "Data analysis shows an adequate balance between increased response rates and safety that supports the use of up-front high-dose HSCT therapy in younger patients. Most importantly, this study provides further confirmation that the introduction of HSCT has significantly prolonged survival of patients with MM."

Our news correspondents report that additional information may be obtained by contacting R. Perez, Hospital Universitario Virgen de Arrixaca, Murcia, Spain. Additional authors for this research include M.S. Duran, J. Mayans, A. Soler, I. Castillo, M. Jurado, P. Ribas, M.C. Menchaca Echevarria, M.T. Hernandez, M.D. Lopez Garcia-Carreno, A. Echeveste Gutierrez, A. Bailen Garcia, S. Lopez, J. Baquero and G. Ramirez.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ejh.12611. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Prostate Cancer

Studies from University Hospital Update Current Data on Prostate Cancer (Gonadotropin-releasing hormone antagonists versus standard androgen suppression therapy for advanced prostate cancer A systematic review with meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Prostate Cancer is now available. According to
news reporting out of Erlangen, Germany, by NewsRx editors, research stated, "To evaluate efficacy and safety of gonadotropin-releasing hormone (GnRH) antagonists compared to standard androgen suppression therapy for advanced prostate cancer. The international review team included methodologists of the German Cochrane Centre and clinical experts."

Our news journalists obtained a quote from the research from University Hospital, "We searched CENTRAL, MEDLINE, Web of Science, EMBASE, trial registries and conference books for randomised controlled trials (RCT) for effectiveness data analysis, and randomised or non-randomised controlled studies (non-RCT) for safety data analysis (March 2015). Two authors independently screened identified articles, extracted data, evaluated risk of bias and rated quality of evidence according to GRADE. 13 studies (10 RCTs, 3 non-RCTs) were included. No study reported cancer-specific survival or clinical progression. There were no differences in overall mortality (RR 1.35, 95% CI 0.63 to 2.93), treatment failure (RR 0.91, 95% CI 0.70 to 1.17) or prostate-specific antigen progression (RR 0.83, 95% CI 0.64 to 1.06). While there was no difference in quality of life related to urinary symptoms, improved quality of life regarding prostate symptoms, measured with the International Prostate Symptom Score (IPSS), with the use of GnRH antagonists compared with the use of standard androgen suppression therapy (mean score difference -0.40, 95% CI -0.94 to 0.14, and -1.84, 95% CI -3.00 to -0.69, respectively) was found. Quality of evidence for all assessed outcomes was rated low according to GRADE. The risk for injection-site events was increased, but cardiovascular events may occur less often by using GnRH antagonist. Available evidence is hampered by risk of bias, selective reporting and limited follow-up. There is currently insufficient evidence to make firm conclusive statements on the efficacy of GnRH antagonist compared to standard androgen suppression therapy for advanced prostate cancer."

According to the news editors, the research concluded: "There is need for further high-quality research on GnRH antagonists with long-term follow-up."

For more information on this research see: Gonadotropin-releasing hormone antagonists versus standard androgen suppression therapy for advanced prostate cancer A systematic review with meta-analysis. Bmj Open, 2015;5(11):e008217. (BMJ Publishing Group - group.bmj.com/; Bmj Open - bmjopen.bmj.com/)

Our news journalists report that additional information may be obtained by contacting F. Kunath, Dept. of Urology, University Hospital Erlangen, Erlangen, Germany UroEvidence, Deutsche Gesellschaft fur Urologie, Dusseldorf, Berlin, Germany. Additional authors for this research include H. Borgmann, A. Blumle, B. Keck, B. Wullich, C. Schmucker, D. Sikic, C. Roelle, S. Schmidt, A. Wahba and J.J Meerpohl.

Studies from University Hospital Update Current Data on Pulmonary Edema (Delayed renal dysfunction and flash pulmonary edema post endovascular abdominal aneurysm repair)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Lung Diseases and Conditions - Pulmonary Edema are discussed in a new report. According to news reporting out of Grenoble, France, by NewsRx editors, research stated, "After endovascular aortic repair (EVAR), the deterioration in long-term renal function is probably multifactorial. Preoperative renal failure is an independent risk factor."

Our news journalists obtained a quote from the research from University Hospital, "Postoperative renal dysfunction can be associated with inadvertent renal artery occlusion, renal artery complications as stenosis, plaque dislodgement, or dissection. Ischemic nephropathy can accelerate hypertension and circulatory congestion. We report a case of coverage of the renal arteries symptomatic with flash pulmonary edema and renal failure 15 months after EVAR, suggesting a delayed endograft migration."

According to the news editors, the research concluded: "The patient had complete resolution of symptoms and renal function after renal artery stenting with placement between endograft and aneurysm to the left renal artery."

Our news journalists report that additional information may be obtained by contacting P.L. Carron, Service de Nephrologie, Dialyse et Transplantation, Centre Hospitalier Universitaire, Grenoble, France. Additional authors for this research include N. Piliero, M. Heitz, M. Kribs, M. Rodiere, P. Jousse, S. Gunther-Calvino and F. Thony.

Studies from University Hospital Yield New Data on Vascular Medicine (Transarterial embolization of peripheral arteriovenous malformations with ethylenevinyl alcohol copolymer feasibility, technical outcomes, and clinical outcomes)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Health and Medicine - Vascular Medicine are presented in a new report. According to news reporting originating from Leuven, Belgium, by NewsRx correspondents, research stated, "The technical and clinical outcomes of catheter-directed embolization for peripheral arteriovenous malformations (AVM) using Onyx (ethylene-vinyl alcohol copolymer) are not well documented. The purpose of this study was to retrospectively assess the safety, technical outcomes and clinical outcomes of catheter-directed Onyx embolisation for the treatment of symptomatic peripheral AVMs."

Our news editors obtained a quote from the research from University Hospital, "Demographics, (pre-)interventional clinical and radiological data were assessed. Follow-up was based on hospital medical records and telephone calls to the patients' general practitioners. Radiological success was defined as complete angiographic eradication of the peripheral AVM nidus. Clinical success was defined as major clinical improvement or complete disappearance of the initial symptoms. 25 procedures were performed in 22 patients. The principal indications for treatment were pain (n = 10), limb swelling (n = 6), recurrent bleeding (n = 2), tinnitus (n = 3), and exertional dyspnoea (n = 1). Complete radiological success was obtained in eight patients (36 %); near complete eradication of the nidus was achieved in the remaining 14 patients. Adjunctive embolic agents were used in nine patients (41 %). Clinical success was observed in 18 patients (82%). Major complications were reported in two patients (9%). During follow-up, seven patients (32%) presented with symptom recurrence, which required additional therapy in three patients."

According to the news editors, the research concluded: "Catheter-directed embolisation of peripheral AVMs with Onyx resulted in major clinical improvement or complete disappearance of symptoms in the vast majority of patients, although complete angiographic exclusion of the AVMs occurred in only a minority of patients."

For more information on this research see: Transarterial embolization of peripheral arteriovenous malformations with ethylenevinyl alcohol copolymer feasibility, technical outcomes, and clinical outcomes. Neurodegenerative Diseases and Conditions -...

Studies from University Hospital Yield New Information about Amyotrophic Lateral Sclerosis (Interleukin-1 Antagonist Anakinra in Amyotrophic Lateral Sclerosis--A Pilot Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Neurodegenerative Diseases and Conditions - Amyotrophic Lateral Sclerosis. According to news reporting from Berlin, Germany, by
NewsRx journalists, research stated, "Preclinical studies show that blocking Interleukin-1 (IL-1) retards the progression of Amyotrophic Lateral Sclerosis (ALS). We assessed the safety of Anakinra (ANA), an IL-1 receptor antagonist, in ALS patients."

The news correspondents obtained a quote from the research from University Hospital, "In a single arm pilot study we treated 17 ALS patients with ANA (100 mg) daily for one year. We selected patients with dominant or exclusive lower motor neuron degeneration (LMND) presentation, as peripheral nerves may be more accessible to the drug. Our primary endpoint was safety and tolerability. Secondary endpoints included measuring disease progression with the revised ALS functional rating scale (ALSFRSr). We also quantified serum inflammatory markers. For comparison, we generated a historical cohort of 47 patients that fit the criteria for enrollment, disease characteristics and rate of progression of the study group. Only mild adverse events occurred in ALS patients treated with ANA. Notably, we observed lower levels of cytokines and the inflammatory marker fibrinogen during the first 24 weeks of treatment. Despite of this, we could not detect a significant reduction in disease progression during the same period in patients treated with ANA compared to controls as measured by the ALSFRSr. In the second part of the treatment period we observed an increase in serum inflammatory markers. Sixteen out of the 17 patients (94%) developed antibodies against ANA. This study showed that blocking IL-1 is safe in patients with ALS."

According to the news reporters, the research concluded: "Further trials should test whether targeting IL-1 more efficiently can help treating this devastating disease."

For more information on this research see: Interleukin-1 Antagonist Anakinra in Amyotrophic Lateral Sclerosis--A Pilot Study. Plos One, 2015;10(10):e0139684. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Ventilator-Associated Pneumonia. According to news originating from Iraklion, Greece, by NewsRx correspondents, research stated, "Limited data exist regarding prognostic factors and optimal antimicrobial treatment of infections caused by extensively drug-resistant Acinetobacter baumannii (XDR-AB). This retrospective cohort study included 93 adult patients who developed ventilator-associated pneumonia (VAP) due to XDR-AB in the ICU of the University Hospital of Heraklion, Greece, from October 2012 to April 2015."

Our news journalists obtained a quote from the research from University Hospital, "XDR-AB isolates were mainly susceptible to colistin (93.5%) and tigecycline (25.8%), whereas 6 (6.5%) were pandrugresistant. Prior to infection, patients had long durations of mechanical ventilation and hospital stay and multiple exposures to antibiotics. Median Charlson co-morbidity and APACHE II scores were 2 and 17, respectively. Mortality at 28 days of infection onset was high (34.4%) despite high rates of in-vitroactive empirical (81.7%) and definitive (90.3%) treatment. Active colistin-based combination therapy (n = 55) and monotherapy (n = 29) groups had similar 28-day mortality (27.6% vs. 30.9%, respectively) and Kaplan-Meier survival estimates over time. In multivariable Cox regression, advanced age (aHR = 1.05 per year increase, 95% CI 1.02-1.09), rapidly fatal underlying disease (aHR = 2.64, 95% CI 0.98-9.17) and APACHE II score (aHR = 1.06 per unit increase, 95% CI 0.99-1.14) were identified as independent predictors of 28-day mortality, but no difference in mortality hazards between the active colistin-based combination therapy and monotherapy groups was produced (aHR = 0.88, 95% CI 0.35-2.38)."

According to the news editors, the research concluded: "These results support the use of colistin as a first-line agent against VAP in settings where XDR-AB is endemic, but oppose the introduction of colistin-based combination therapy as standard treatment."

The news correspondents report that additional information may be obtained from C. Tsioutis, Univ Hosp Herakl, Dept. of Internal Med Infect Dis, Iraklion 71110, Crete, Greece. Additional authors for this research include E.I. Kritsotakis, S.A. Karageorgos, S. Stratakou, C. Psarologakis, S. Kokkini and A. Gikas.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijantimicag.2016.07.007. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Atrial Fibrillation

Studies from University Hospital in the Area of Atrial Fibrillation Described (Balance between sodium and calcium currents underlying chronic atrial fibrillation termination: An in silico intersubject variability study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Atrial Fibrillation is the subject of a report. According to news reporting from Madrid, Spain, by NewsRx journalists, research stated, "Atrial remodeling as a result of long-standing persistent atrial fibrillation (AF) induces substrate modifications that lead to different perpetuation mechanisms than in paroxysmal AF and a reduction in the efficacy of antiarrhythmic treatments. The purpose of this study was to identify the ionic current modifications that could destabilize reentries during chronic AF and serve to personalize antiarrhythmic strategies."

The news correspondents obtained a quote from the research from University Hospital, "A population of 173 mathematical models of remodeled human atrial tissue with realistic intersubject variability was developed based on action potential recordings of 149 patients diagnosed with AF. The relationship of each ionic current with AF maintenance and the dynamics of functional reentries (rotor meandering, dominant frequency) were evaluated by means of 3-dimensional simulations. Self-sustained reentries were maintained in 126 (73%) of the simulations. AF perpetuation was associated with higher expressions of I-Na and I-caL (P < .01), with no significant differences in the remaining currents. I-caL blockade promoted AF extinction in 30% of these 126 models. The mechanism of AF termination was related with collisions between rotors because of an increase in rotor meandering (1.71 +/- 2.01cm(2)) and presented an increased efficacy in models with a depressed INa (P < .01). Mathematical simulations based on a population of models representing intersubject variability allow the identification of ionic mechanisms underlying rotor dynamics and the definition of new personalized pharmacologic strategies."

According to the news reporters, the research concluded: "Our results suggest that the underlying mechanism of the diverging success of I-caL block as an antiarrhythmic strategy is dependent on the basal availability of sodium and calcium ion channel conductivities."

Our news journalists report that additional information may be obtained by contacting A. Liberos, Inst Investigac Sanitaria Gregorio Marahon, Hosp Gen Univ Gregorio Marahon, Dept. of Cardiol, Madrid, Spain. Additional authors for this research include A. Bueno-Orovio, M. Rodrigo, U. Ravens, I. Hernandez-Romero, F. Fernandez-Aviles, M.S. Guillem, B. Rodriguez and A.M. Climent.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.hrthm.2016.08.028. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Colon Cancer

Studies from University Hospital in the Area of Colon Cancer Reported (The evolving role of microsatellite instability in colorectal cancer: A review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Colon Cancer is now available. According to news reporting out of Modena, Italy, by NewsRx editors, research stated, "Microsatellite instability (MSI) is a molecular marker of a deficient mismatch repair (MMR) system and occurs in approximately 15% of colorectal cancers (CRCs), more frequently in early than late-stage of disease. While in sporadic cases (about two-thirds of MSI-H CRCs) MMR deficiency is caused by an epigenetic inactivation of MLH1 gene, the remainder are associated with Lynch syndrome, that is linked to a germ-line mutation of one of the MMR genes (MLH1, MSH2, MSH6, PMS2)."

Our news journalists obtained a quote from the research from University Hospital, "MSI-H colorectal cancers have distinct clinical and pathological features such as proximal location, early-stage (predominantly stage II), poor differentiation, mucinous histology and association with BRAF mutations. In early-stage CRC, MSI can select a group of tumors with a better prognosis, while in metastatic disease it seems to confer a negative prognosis. Although with conflicting results, a large amount of preclinical and clinical evidence suggests a possible resistance to 5-FU in these tumors. The higher mutational load in MSI-H CRC can elicit an endogenous immune anti-tumor response, counterbalanced by the expression of immune inhibitory signals, such as PD-1 or PD-L1, that resist tumor elimination."

According to the news editors, the research concluded: "Based on these considerations, MSI-H CRCs seem to be particularly responsive to immunotherapy, such as anti-PD-1, opening a new era in the treatment landscape for patients with metastatic CRC."

Our news journalists report that additional information may be obtained by contacting F. Gelsomino, Univ Hosp Modena, Div Oncol, I-41124 Modena, Italy. Additional authors for this research include M. Barbolini, A. Spallanzani, G. Pugliese and S. Cascinu.

Studies from University Hospital in the Area of Liver Cancer Described (A possible role of microRNAs as predictive markers for the recurrence of hepatocellular carcinoma after liver transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Cancer have been published. According to news reporting from Frankfurt, Germany, by NewsRx journalists, research stated, "With favourable 5-year survival rates up to 75%, liver transplantation (LT) is the treatment of choice for hepatocellular carcinoma (HCC). Nonetheless, tumor recurrence after LT remains a challenge."

The news correspondents obtained a quote from the research from University Hospital, "The aim of this retrospective study was to develop a predictive score for tumor recurrence after LT by combining clinical parameters with HCC biomarkers (microRNA). A microRNA (miRNA) microarray analysis was used to compare miRNA expression patterns in tissue samples of 40 patients with and without HCC recurrence after LT. In a screening cohort (n=18), the miRNA analysis identified significant differences in the expression of 13 miRNAs in patients with tumor recurrence. Using the most significant miRNAs in this screening cohort, we could develop a predictive score, which combined the expression levels of miR-214, miR-3187 and the Milan criteria, and we could define low-and high-risk groups for tumor recurrence and death. The above score was evaluated in a second and independent cohort (n=22). In contrast to the Milan criteria alone, this score was significantly associated with tumor recurrence."

According to the news reporters, the research concluded: "Our analysis indicated that the use of a specific miRNA expression pattern in combination with a limited tumor burden as defined by the Milan criteria may lead to a more accurate prediction of tumor recurrence."

Our news journalists report that additional information may be obtained by contacting J. Liese, Dept. of General and Visceral Surgery, University Hospital Frankfurt, Goethe University, Frankfurt, Germany. Additional authors for this research include J. Peveling-Oberhag, C. Doering, A.A. Schnitzbauer, E. Herrmann, S. Zangos, M.L. Hansmann, C. Moench, M.W. Welker, S. Zeuzem, W.O. Bechstein and F. Ulrich.

Studies from University Hospital in the Area of beta-Lactams Described

[Universal protocol for the rapid automated detection of carbapenem-resistant Gram-negative bacilli directly from blood cultures by matrix-assisted laser ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on beta-Lactams are discussed in a new report. According to news reporting originating in La Coruna, Spain, by NewsRx journalists, research stated, "Detection of carbapenemase-producing bacteria directly from blood cultures is a major challenge, as patients with bacteraemia are critically ill. Early detection can be helpful for selection of the most appropriate antibiotic therapy as well as adequate control of outbreaks."

The news reporters obtained a quote from the research from University Hospital, "In the current study, a novel matrix-assisted laser desorption/ionisation time-of-flight (MALDI-TOF)-based method was developed for the rapid, automated detection of carbapenemase-producing Enterobacteriaceae, Pseudomonas aeruginosa and Acinetobacter baumannii directly from blood cultures. Carbapenemase activity was determined in 30 min by measuring hydrolysis of imipenem (0.31 mg/mL) in blood cultures spiked with a series of 119 previously characterised isolates, 81 of which carried a carbapenemase enzyme (10 βla(KPC), 10 βla(VIM), 10 βla(NDM), 10 βla(IMP), 26 βla(OXA-48-type), 9 βla(OXA-23), 1 βla(OXA-237), 3 βla(OXA-24) and 2 βla(OXA-58)). Twenty blood cultures obtained from bacteraemic patients carrying βla(OXA-48)-producing isolates were also analysed using the same protocol. Analysis was performed using MALDI-TOF Biotyper ® Compass software, which automatically provides a result of sensitivity or resistance, calculated as the logRQ or ratio of hydrolysis of the antibiotic. This assay is simple to perform, inexpensive, time saving, universal for Gram-negative bacilli, and highly reliable (overall sensitivity and specificity of 98% and 100%, respectively)."

According to the news reporters, the research concluded: "Moreover, the protocol could be established as a standardised method in clinical laboratories as it does not require specialised training in mass spectrometry."

Our news correspondents report that additional information may be obtained by contacting G. Bou, Complejo Hosp Univ A Coruna, Microbiol Serv, La Coruna 15006, Spain. Additional authors for this research include K. Sparbier, M.J. Barba, M. Kostrzewa and G. Bou. The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijantimicag.2016.08.024. Oncology - Breast Cancer

Studies from University of Adelaide Add New Findings in the Area of Breast Cancer [Anticancer efficacy of the hypoxia-activated prodrug evofosfamide (TH-302) in osteolytic breast cancer murine models]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Breast Cancer. According to news reporting out of Woodville, Australia, by NewsRx editors, research stated, "Tumor hypoxia is a major cause of treatment failure for a variety of malignancies. However, hypoxia offers treatment opportunities, exemplified by the development of compounds that target hypoxic regions within tumors."

Funders for this research include National Health and Medical Research Council, Hospital Research Foundation, Adelaide, South Australia, National Breast Cancer Foundation, Australian Breast Cancer Research.

Our news journalists obtained a quote from the research from the University of Adelaide, "Evofosfamide (TH-302) is a prodrug created by the conjugation of 2-nitroimidazole to bromo-isophosphoramide mustard (Br-IPM). When evofosfamide is delivered to hypoxic regions, the DNA cross-linking effector, Br-IPM, is released. This study assessed the cytotoxic activity of evofosfamide in vitro and its antitumor activity against osteolytic breast cancer either alone or in combination with paclitaxel in vivo. A panel of human breast cancer cell lines were treated with evofosfamide under hypoxia and assessed for cell viability. Osteolytic MDA-MB-231-TXSA cells were transplanted into the mammary fat pad, or into tibiae of mice, allowed to establish and treated with evofosfamide, paclitaxel, or both. Tumor burden was monitored using bioluminescence, and cancer-induced bone destruction was measured using micro-CT. In vitro, evofosfamide was selectively cytotoxic under hypoxic conditions. In vivo evofosfamide was tumor suppressive as a single agent and cooperated with paclitaxel to reduce mammary tumor growth. Breast cancer cells transplanted into the tibiae of mice developed osteolytic lesions. In contrast, treatment with evofosfamide or paclitaxel resulted in a significant delay in tumor growth and an overall reduction in tumor burden in bone, whereas combined treatment resulted in a significantly greater reduction in tumor burden in the tibia of mice."

According to the news editors, the research concluded: "Evofosfamide cooperates with paclitaxel and exhibits potent tumor suppressive activity against breast cancer growth in the mammary gland and in bone."

Our news journalists report that additional information may be obtained by contacting V. Liapis, Discipline of Surgery, Breast Cancer Research Unit, Basil Hetzel Institute and Centre for Personalised Cancer Medicine, University of Adelaide Woodville, Woodville, South Australia, Australia. Oncology - Cancer Detection

Studies from University of Adelaide Yield New Data on Cancer Detection (Cancer Detection in Human Tissue Samples Using a Fiber-Tip pH Probe)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Cancer Detection is the subject of a report. According to news reporting from Adelaide, Australia, by NewsRx journalists, research stated, "Intraoperative detection of tumorous tissue is an important unresolved issue for cancer surgery. Difficulty in differentiating between tissue types commonly results in the requirement for additional surgeries to excise unremoved cancer tissue or alternatively in the removal of excess amounts of healthy tissue."

The news correspondents obtained a quote from the research from the University of Adelaide, "Although pathologic methods exist to determine tissue type during surgery, these methods can compromise postoperative pathology, have a lag of minutes to hours before the surgeon receives the results of the tissue analysis, and are restricted to excised tissue. In this work, we report the development of an optical fiber probe that could potentially find use as an aid for margin detection during surgery. A fluorophore-doped polymer coating is deposited on the tip of an optical fiber, which can then be used to record the pH by monitoring the emission spectra from this dye. By measuring the tissue pH and comparing with the values from regular tissue, the tissue type can be determined quickly and accurately. The use of a novel lift-and-measure technique allows for these measurements to be performed without influence from the inherent autofluorescence that commonly affects fluorescence-based measurements on biological samples. The probe developed here shows strong potential for use during surgery, as the probe design can be readily adapted to a low-cost portable configuration, which could find use in the operating theater."

According to the news reporters, the research concluded: "Use of this probe in surgery either on excised or in vivo tissue has the potential to improve success rates for complete removal of cancers."

Lung Diseases and Conditions - Bronchopulmonary...

Studies from University of Alabama Have Provided New Information about Bronchopulmonary Dysplasia (Of mice and men: correlations between microRNA-17 similar to 92 cluster expression and promoter methylation in severe bronchopulmonary dysplasia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Lung Diseases and Conditions - Bronchopulmonary Dysplasia have been presented. According to news originating from Birmingham, Alabama, by NewsRx correspondents, research stated, "We previously demonstrated that decreased miR-17 similar to 92 cluster expression was 1) present in lungs from human infants who died with bronchopulmonary dysplasia (BPD); 2) inversely correlated with DNA methyltransferase (DNMT) expression and promoter methylation; and 3) correlated with a subsequent diagnosis of BPD at 36 wk gestational age. We tested the hypothesis that plasma miR-17 levels would be lowest in infants who ultimately develop severe BPD."

Our news journalists obtained a quote from the research from the University of Alabama, "Secondly, we utilized our well-characterized murine model of severe BPD that combines perinatal inflammation with postnatal hyperoxia to test the hypothesis that alterations in lung miR-17 similar to 92, DNMT, and promoter methylation in our model would mirror our findings in tissues from premature human infants. Plasma was obtained during the first 5 days of life from premature infants born <= 32 wk gestation. Lung tissues were harvested from mice exposed to maternal inflammation and neonatal hyperoxia for 14 days after birth. miR-17 similar to 92 cluster expression and DNA methyltransferase expression were measured by qRT-PCR, and promoter methylation was assessed by Methyl-Profiler assay. Plasma miR-17 levels are significantly lower in the first week of life in human infants who develop severe BPD compared with mild or moderate BPD. Data from our severe BPD murine model reveal that lung miR-17 similar to 92 cluster expression is significantly attenuated, and levels inversely correlated with DNMT expression and miR-17 similar to 92 cluster promoter methylation."

According to the news editors, the research concluded: "Collectively, our data support a plausible role for epigenetically altered miR-17 similar to 92 cluster in the pathogenesis of severe BPD."

The news correspondents report that additional information may be obtained from T.E. Tipple, Univ Alabama Birmingham, Medical Sch Birmingham, Div Neonatol, Birmingham, AL, United States. Additional authors for this research include D. Dakhlallah, C.B. Marsh, L.K. Rogers and T.E. Tipple.

Central Nervous System Diseases and Conditions –…

Studies from University of Alabama Update Current Data on Subarachnoid Hemorrhage (Association of nosocomial infections with delayed cerebral ischemia in aneurysmal subarachnoid hemorrhage)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Central Nervous System Diseases and Conditions - Subarachnoid Hemorrhage. According to news reporting originating from Birmingham, Alabama, by NewsRx correspondents, research stated, "Delayed cerebral ischemia (DCI) is a recognized complication' of aneurysmal subarachnoid hemorrhage (aSAH) that contributes to poor outcome. This study seeks to determine the effect of nosocomial infection on the incidence of DCI and patient outcome."

Our news editors obtained a quote from the research from the University of Alabama, "An exploratory analysis was performed on 156 patients with aSAH enrolled in the Cerebral Aneurysm Renin Angiotensin System study. Clinical and radiographic data were analyzed with univariate analysis to detect risk factors for the development of DCI and poor outcome. Multivariate logistic regression was performed to identify independent predictors of DCI. One hundred fifty-three patients with aSAH were included. DCI was identified in 32 patients (20.9%). Nosocomial infection (odds ratio [OR] 3.5, 95% confidence interval [CI] 1.09-11.2, p = 0.04), ventriculitis (OR 25.3, 95% CI 1.39-458.7, p = 0.03), aneurysm re-rupture (OR 7.55, 95% CI 1.02-55.7, p = 0.05), and clinical vasospasm (OR 43.4, 95% CI 13.1-143.4, p<0.01) were independently associated with the development of DCI. Diagnosis of nosocomial infection preceded the diagnosis of DCI in 15 (71.4%) of 21 patients. Patients diagnosed with nosocomial infection experienced significantly worse outcomes as measured by the modified Rankin Scale score at discharge and 1 year (p < 0.01 and p = 0.03, respectively). Nosocomial infection is independently associated with DCI."

According to the news editors, the research concluded: "This association is hypothesized to be partly causative through the exacerbation of systemic inflammation leading to thrombosis and subsequent ischemia."

For more information on this research see: Association of nosocomial infections with delayed cerebral ischemia in aneurysmal subarachnoid hemorrhage. *Journal of Neurosurgery*, 2016;125(6):1383-1389. *Journal of Neurosurgery* can be contacted at: Amer Assoc Neurological Surgeons, 5550 Meadowbrook Drive, Rolling Meadows, IL 60008, USA.

Oncology - Breast Cancer

Studies from University of Alcala Reveal New Findings on Breast Cancer (Growth hormone-releasing hormone induced transactivation of epidermal growth factor receptor in human triple-negative breast cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Breast Cancer. According to news reporting originating from Alcala de Henares, Spain, by NewsRx correspondents, research stated, "Triple-negative breast cancer (TNBC) is a subset of breast cancers which is negative for expression of estrogen and progesterone receptors and human epidermal growth factor receptor-2 (HER2). Chemotherapy is currently the only form of treatment for women with TNBC."

Funders for this research include Fundacion para la Investigacion Biomedica del Hospital Universitario Principe de Asturias, University of Alcala, Medical Research Service of the Veterans Affairs Department, University of Miami.

Our news editors obtained a quote from the research from the University of Alcala, "Growth hormone-releasing hormone (GHRH) and epidermal growth factor (EGF) are autocrine/paracrine growth factors in breast cancer and a substantial proportion of TNBC expresses receptors for GHRH and EGF. The aim of this study was to evaluate the interrelationship between both these signaling pathways in MDA-MB-468 human TNBC cells. We evaluated by Western blot assays the effect of GHRH on transactivation of EGF receptor (EGFR) as well as the elements implicated. We assessed the effect of GHRH on migration capability of MDA-MB-468 cells as well as the involvement of EGFR in this process by means of wound-healing assays. Our findings demonstrate that in MDA-MB-468 cells the stimulatory activity of GHRH on tyrosine phosphorylation of EGFR is exerted by two different molecular mechanisms: i) through GHRH receptors, GHRH stimulates a ligand-independent activation of EGFR involving at least cAMP/PKA and Src family signaling pathways; ii) GHRH also stimulates a ligand-dependent activation of EGFR implicating an extracellular pathway with an important role for metalloproteinases. The cross-talk between EGFR and GHRHR may be impeded by combining drugs acting upon GHRH receptors and EGFR family members."

According to the news editors, the research concluded: "This combination of GHRH receptors antagonists with inhibitors of EGFR signalling could enhance the efficacy of both
types of agents as well as reduce their doses increasing therapeutic benefits in management of human breast cancer."

The news editors report that additional information may be obtained by contacting A.M. Bajo, Univ Alcala De Henares, Dept. of Syst Biol, Alcala De Henares 28871, Spain. Additional authors for this research include L. Munoz-Moreno, P.L. Valenzuela, J.C. Prieto, A.V. Schally, M.J. Carmena and A.M. Bajo.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.peptides.2016.11.004. This DOI is a link to an online electronic document that is either free or for purchase.

**Pain Medicine - Anesthesiology**

**Studies from University of Arizona Further Understanding of Anesthesiology (Strategies to improve first attempt success at intubation in critically ill patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Pain Medicine - Anesthesiology is now available.

According to news reporting out of Tucson, Arizona, by NewsRx editors, research stated, "Tracheal intubation in critically ill patients is a high-risk procedure. The risk of complications increases with repeated or prolonged attempts, making expedient first attempt success the goal for airway management in these patients."

Our news journalists obtained a quote from the research from the University of Arizona, "related factors often make visualization of the airway and placement of the tracheal tube difficult. Physiologic derangements reduce the patient's tolerance for repeated or prolonged attempts at laryngoscopy and, as a result, hypoxaemia and haemodynamic deterioration are common complications. Operator-related factors such as experience, device selection, and pharmacologic choices affect the odds of a successful intubation on the first attempt."

According to the news editors, the research concluded: "This review will discuss the 'difficult airway' in critically ill patients and highlight recent advances in airway management that have been shown to improve first attempt success and decrease adverse events associated with the intubation of critically ill patients."

Our news journalists report that additional information may be obtained by contacting J.M. Mosier, University of Arizona, Coll Med, Dept. of Emergency Med, Tucson, AZ 85724, United States. Additional authors for this research include J. Malo, C.D. Hypes, J.C. Sakles and J.M. Mosier.

Keywords for this news article include: Tucson, Arizona, United States, North and Central America, Anesthesiology, Pain Medicine, Critical Care, Risk and Prevention, Medical Devices, University of Arizona.

Myelomas

Studies from University of Arkansas Have Provided New Information about Myelomas (The Spectrum and Clinical Impact of Epigenetic Modifier Mutations in Myeloma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Myelomas is now available. According to news reporting originating from Little Rock, Arkansas, by NewsRx correspondents, research stated, "Epigenetic dysregulation is known to be an important contributor to myeloma pathogenesis but, unlike other B-cell malignancies, the full spectrum of somatic mutations in epigenetic modifiers has not been reported previously. We sought to address this using the results from whole-exome sequencing in the context of a large prospective clinical trial of newly diagnosed patients and targeted sequencing in a cohort of previously treated patients for comparison."

Our news editors obtained a quote from the research from the University of Arkansas, "Whole-exome sequencing analysis of 463 presenting myeloma cases entered in the UK NCRI Myeloma XI study and targeted sequencing analysis of 156 previously treated cases from the University of Arkansas for Medical Sciences (Little Rock, AR). We correlated the presence of mutations with clinical outcome from diagnosis and compared the mutations found at diagnosis with later stages of disease. In diagnostic myeloma patient samples, we identify significant mutations in genes encoding the histone 1 linker protein, previously identified in other B-cell malignancies. Our data suggest an adverse prognostic impact from the presence of lesions in genes encoding DNA methylation modifiers and the histone demethylase KDM6A/UTX. The frequency of mutations in epigenetic modifiers appears to increase following treatment most notably in genes encoding histone methyltransferases and DNA methylation modifiers."

According to the news editors, the research concluded: "Numerous mutations identified raise the possibility of targeted treatment strategies for patients either at diagnosis or relapse supporting the use of sequencing-based diagnostics in myeloma to help guide therapy as more epigenetic targeted agents become available."

For more information on this research see: The Spectrum and Clinical Impact of Epigenetic Modifier Mutations in Myeloma. Clinical Cancer Research, 2016;22(23):5783-5794. Clinical Cancer Research can be contacted at: Amer Assoc Cancer Research, 615
Oncology - Glioblastomas

Studies from University of Arkansas for Medical Sciences Yield New Information about Glioblastomas (Kynurenine Signaling Increases DNA Polymerase Kappa Expression and Promotes Genomic Instability in Glioblastoma Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Glioblastomas. According to news reporting from Little Rock, Arkansas, by NewsRx journalists, research stated, "Overexpression of the translesion synthesis polymerase hpol k in glioblastomas has been linked to poor patient prognosis; however, the mechanism promoting higher expression in these tumors remains unknown. We determined that activation of the aryl hydrocarbon receptor (AhR) pathway in glioblastoma cells leads to increased hpol k mRNA and protein levels."

Financial supporters for this research include National Center for Advancing Translational Sciences, National Cancer Institute, Division of Graduate Education, College of Medicine, University of Arkansas for Medical Sciences.

The news correspondents obtained a quote from the research from the University of Arkansas for Medical Sciences, "We blocked nuclear translocation and DNA binding by AhR in glioblastoma cells using a small-molecule and observed decreased hpol k expression. Pharmacological inhibition of tryptophan-2,3-dioxygenase (TDO), the enzyme largely responsible for activating AhR in glioblastoma, led to a decrease in the endogenous AhR agonist kynurenine and a corresponding decrease in hpol k protein levels. Importantly, we discovered that inhibiting TDO activity, AhR signaling, or suppressing hpol k expression with RNA interference led to decreased chromosomal damage in glioblastoma cells. Epistasis assays further supported the idea that TDO activity, activation of AhR signaling, and the resulting overexpression of hpol k function primarily in the same pathway to increase endogenous DNA damage."

According to the news reporters, the research concluded: "These findings indicate that upregulation of hpol k through glioblastoma-specific TDO activity and activation of AhR signaling likely contributes to the high levels of replication stress and genomic instability.
observed in these tumors."

For more information on this research see: Kynurenine Signaling Increases DNA Polymerase Kappa Expression and Promotes Genomic Instability in Glioblastoma Cells. *Chemical Research In Toxicology*, 2015;29(1):101-8. (American Chemical Society - www.acs.org; Chemical Research In Toxicology - www.pubs.acs.org/journal/crtoec)

Our news journalists report that additional information may be obtained by contacting A.C. **Gram-Negative Bacteria - Escherichia coli**

**Studies from University of Aveiro Describe New Findings in Escherichia coli (Characterization and in vitro evaluation of new bacteriophages for the biocontrol of Escherichia coli)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - Escherichia coli. According to news reporting originating in Aveiro, Portugal, by NewsRx journalists, research stated, "In the present study two new phages (phT4A and ECA2) were characterized and their efficacy was evaluated separately and in cocktail (phT4A/ECA2) to control Escherichia coli. The isolated phages, phT4A and ECA2, belonged to the Myoviridae and Podoviridae family, respectively and both are safe (no integrase and toxin codifying genes) to be used in bacterial control."

Funders for this research include FEDER, National funding through Fundacao para a Ciencia e Tecnologia (FCT).

The news reporters obtained a quote from the research from the University of Aveiro, "In general, the increase of multiplicity of infection (MOI) from 1 to 100 promoted a significant increase in the efficiency of phage phT4A and phage cocktail phT4A/ECA2. Both phages were effective against E. coli, but phage phT4A (reduction of 5.8 log CFLI/mL after 8 h treatment) was more effective than phage ECA2 phage (reduction of 4.7 log CFLI/mL after 8 h treatment). The use of a cocktail phT4A/ECA2 was significantly more effective (reductions of 6.2 log CFU/mL after 6 h treatment) than the use single phage suspensions of phT4A and ECA2 (reductions 5.3 log CFU/mL and 4.9 log CFU/mL, respectively, after 6 h treatment)."

According to the news reporters, the research concluded: "The rate of emergence of phage-resistant mutants was lower for phage phT4A when compared with phage ECA2 and phage cocktail phT4A/ECA2. The results indicate that in addition to the efficacy, the potential
development of phage-resistant mutants must also be considered in the design of phage cocktails."

For more information on this research see: Characterization and in vitro evaluation of new bacteriophages for the biocontrol of Escherichia coli. Virus Research, 2017;227():171-182. Musculoskeletal Diseases and Conditions - …

Studies from University of Barcelona Update Current Data on Rheumatic Diseases and Conditions (IgG4-related disease: Advances in the diagnosis and treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Rheumatic Diseases and Conditions have been published. According to news originating from Barcelona, Spain, by NewsRx correspondents, research stated, "IgG4-related disease is a rare immune-mediated systemic disease with the capability of involving essentially any organ. Although the presenting clinical features vary substantially according to the specialty to which patients present first, perhaps the most common clinical presentation is that of single or multiple organ enlargement, arousing suspicion of cancer."

Funders for this research include Fondo de Investigaciones Sanitarias, Ajut per a la Recerca Josep Font.

Our news journalists obtained a quote from the research from the University of Barcelona, "The disease is frequently diagnosed unexpectedly in pathological specimens or on imaging studies. The diagnostic approach is complex and includes not only IgG4-related tests (serum levels, circulating plasmablasts, and specific immunohistochemical studies), but also clinical, laboratory, and imaging tests as well as the typical histopathological features (lymphocytic infiltration, storiform fibrosis, eosinophilic infiltration, and obliterative phlebitis). IgG4-related tests should not be considered as diagnostic in the absence of an appropriate clinical scenario. Therapeutic approaches reported to date pertain primarily to glucocorticoids, but the use of these medications has not been studied in a controlled or prospective manner."

According to the news editors, the research concluded: "The most current investigational treatment approaches have focused on targeting cells of the B-cell lineage,
including B-cell-depleting agents (rituximab) and a non-depleting homodimer monoclonal antibody targeting CD19 and Fc-gamma RIIib."

The news correspondents report that additional information may be obtained from M. Ramos-Casals, University of Barcelona, Dept. of Med, Barcelona, Spain. Additional authors for this research include X. Bosch, M. Ramos-Casals and J.H. Stone.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.berh.2016.07.003. This DOI is a link to an online electronic document that is either free or for purchase.

**Nutritional and Metabolic Diseases and Conditions**

**Studies from University of Barcelona Yield New Data on Iron-Deficiency Anemia (Factors Associated with Hospitalization among Emergency Department Patients Referred for Quick Investigation of Iron-Deficiency Anemia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Iron-Deficiency Anemia. According to news reporting out of Barcelona, Spain, by NewsRx editors, research stated, "Although patients with anemia are frequently seen in emergency departments (EDs), studies on patients presenting there with symptomatic chronic anemia--usually iron-deficiency anemia (IDA) caused by occult gastrointestinal bleeding--are lacking. Awareness of predictors of hospitalization could direct the ED triage to the appropriate diagnostic setting."

Our news journalists obtained a quote from the research from the University of Barcelona, "Based on initial observations that some patients with IDA were hospitalized after ED referral and initial evaluation at a quick diagnosis unit (QDU), a new cost-effective alternative to hospitalization for diagnostic workup, this study aimed to determine the patient factors associated with hospitalization after the first QDU visit. An 8-year prospective cohort study of patients with IDA referred from the ED to the QDU of a third-level university hospital was conducted. Patients with a baseline hemoglobin level of <9 g/dL in the ED, proven iron deficiency, and no overt bleeding were included. The primary outcome was hospitalization after the initial QDU assessment. Two hundred eighty-four (7.7%) of 3692 patients were hospitalized. Inter-rater agreement of appropriateness of admissions was 90.6% (k=0.82). Overall, 90% of study patients presented to the ED with symptomatic anemia, and 87% were transfused there. On multivariate analysis, age (>=) 65 years, living alone, a post-transfusion hemoglobin level of <9 g/dL, higher age-adjusted overall comorbidity, heart failure, and poor physical health-related quality of life at first QDU visit independently predicted hospitalization."

According to the news editors, the research concluded: "While these predictors do
not necessarily reflect the need for hospitalization, they are easily evaluated during the initial ED visit and can guide the triage of similar IDA patients to the suitable setting for timely investigation.

Our news journalists report that additional information may be obtained by contacting X. Bosch, Dept. of Internal Medicine, Hospital Clinic, Institut d'Investigacions Biomediques August Pi i Sunyer, University of Barcelona, Barcelona, Spain. Additional authors for this research include E. Monclus, A. Inciarte, P. Moreno, A. Jordan and A. Lopez-Soto.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jemermed.2015.08.010. This DOI is a link to an online electronic document that is either free or for purchase.

**Congenital Diseases and Conditions - Congenital...**

**Studies from University of Barcelona in the Area of Congenital Heart Disease Described [Usefulness of Lung Ultrasound in Neonatal Congenital Heart Disease (LUSNEHDI): Lung Ultrasound to Assess Pulmonary Overflow in Neonatal Congenital Heart ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Congenital Diseases and Conditions - Congenital Heart Disease is the subject of a report. According to news reporting originating from Barcelona, Spain, by NewsRx correspondents, research stated, "This study aimed to explore the pattern of lung ultrasound (LUS) in newborns with congenital heart disease (CHD) and to investigate the accuracy of LUS assessing pulmonary overflow (PO) during the first days of life. Lung ultrasound was performed in 51 newborns during the first days of life, and newborns were classified in two groups depending on the predisposition to develop POas evaluated by the abundance of B-lines."

Our news editors obtained a quote from the research from the University of Barcelona, "The results were compared to the physical examination (PE), chest X-ray, and echocardiography. In both groups there were no differences in abundance of B-lines during the first days of life, but those with a type of CHD with a trend to develop PO had a higher B-lines score after 72 h (p < 0.05) with a good correlation with echocardiography findings and with a better sensibility than PE and chest X-ray."
According to the news editors, the research concluded: "We found that LUS is a reliable tool for the diagnosis of PO and may be useful to monitor and optimize therapy, which should be further validated in multicentre studies."

For more information on this research see: Usefulness of Lung Ultrasound in Neonatal Congenital Heart Disease (LUSNEHDI): Lung Ultrasound to Assess Pulmonary Overflow in Neonatal Congenital Heart Disease. *Pediatric Cardiology*, 2016;37(8):1482-1487. *Pediatric Cardiology* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. **Oncology - Melanoma**

**Studies from University of Bari Reveal New Findings on Melanoma [Detrimental effects of melanocortin-1 receptor (MC1R) variants on the clinical outcomes of BRAF V600 metastatic melanoma patients treated with BRAF inhibitors]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Melanoma is now available. According to news originating from Bari, Italy, by NewsRx correspondents, research stated, "Melanocortin-1 receptor (MC1R) plays a key role in skin pigmentation, and its variants are linked with a higher melanoma risk. The influence of MC1R variants on the outcomes of patients with metastatic melanoma (MM) treated with BRAF inhibitors (BRAFi) is unknown."

Funders for this research include Maria Ruggieri Association, Italian Melanoma Intergroup.

Our news journalists obtained a quote from the research from the University of Bari, "We studied the MC1R status in a cohort of 53 consecutive BRAF-mutated patients with MM treated with BRAFi. We also evaluated the effect of vemurafenib in four (V600)BRAF melanoma cell lines with/without MC1R variants. We found a significant correlation between the presence of MC1R variants and worse outcomes in terms of both overall response rate (ORR; 59% versus 95%, P=0.011 univariate, P=0.028 multivariate analysis) and progression-free survival (PFS) shorter than 6months (72% versus 33%, P=0.012 univariate, P=0.027 multivariate analysis). No difference in overall survival (OS) was reported, probably due to subsequent treatments."

According to the news editors, the research concluded: "Data invitro showed a
significant different phosphorylation of Erk1/2 and p38 MAPK during treatment, associated with a greater increase in vemurafenib IC50 in MC1R variant cell lines."

The news correspondents report that additional information may be obtained from M. Guida, University of Bari, Dept. of Basic Med Sci Neurosci & Sense Organs, Bari, Italy. Additional authors for this research include S. Strippoli, A. Ferretta, N. Bartolomeo, L. Porcelli, I. Maida, A. Azzariti, S. Tommasi, C. Grieco, S. Guida, A. Albano, V. Lorusso and G. Guida.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/pcmr.12516. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Bari, Italy, Europe, Diseases and Conditions, Nerve Tissue Proteins, Pro-Opiomelanocortin, Metastatic Melanoma, Risk and Prevention, Pituitary Hormones, Peptide Proteins, Peptide Hormones, Neuropeptides, Healthcare, Oncology, Genetics, University of Bari.

**Drugs and Therapies - Docetaxel Therapy**

**Studies from University of Basel Have Provided New Information about Docetaxel Therapy (A Cost-Effectiveness Analysis of Nivolumab versus Docetaxel for Advanced Nonsquamous NSCLC Including PD-L1 Testing)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Docetaxel Therapy have been presented. According to news reporting originating from Basel, Switzerland, by NewsRx correspondents, research stated, "Nivolumab (NW) was recently approved in several countries for patients with pretreated advanced NSCLC. NIV is not cost-effective compared with docetaxel (DOC) for the treatment of squamous NSCLC."

Our news editors obtained a quote from the research from the University of Basel, "However, its cost-effectiveness for nonsquamous NSCLC and the consequences of programmed death ligand 1 (PD-L1) testing are unknown. This literature-based health economic study used CheckMate-057 trial data to model the incremental cost-effectiveness ratio (ICER) of NIV versus DOC in the Swiss health care setting. The effect of PD-L1 positivity for patient selection was assessed. In the base case model, NIV (mean cost CHF66,208; mean effect 0.69 quality-adjusted life-years [QALYs]) compared with DOC (mean cost CHF37,618; mean effect 0.53 QALYs) resulted in an ICER of CHF177,478/QALY gained. Treating only patients with PD-L1-positive tumors (threshold >= 10%) with NIV compared with treating all patients with DOC produced a base case ICER of CHF124,891/QALY gained. Reduced drug price, dose, or treatment duration decreased the ICER partly below a willingness-to-pay threshold of CHF100,000/QALY. Health state utilities strongly influenced cost-effectiveness. Compared with DOC, NIV is not cost-effective for the treatment of nonsquamous NSCLC at current prices.
According to the news editors, the research concluded: "Price reduction or PD-L1 testing and selection of patients for NIV on the basis of test positivity improves cost-effectiveness compared with DOC."

The news editors report that additional information may be obtained by contacting K. Matter-Walstra, University of Basel, Inst Pharmaceut Med, CH-4056 Basel, Switzerland. Additional authors for this research include M. Schwenkglenks, S. Aebi, K. Dedes, J. Diebold, M. Pietrini, D. Klingbiel, R. von Moos and O. Gautschi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jtho.2016.05.032. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiology**

**Studies from University of Bologna Update Current Data on Cardiology (Risk of 22q11.2 deletion in fetuses with right aortic arch and without intracardiac anomalies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiology is the subject of a report. According to news originating from Bologna, Italy, by NewsRx correspondents, research stated, "To assess the risk of 22q11.2 deletion in fetuses with a prenatal diagnosis of right aortic arch without intracardiac anomalies (RAA-no ICA). This was a retrospective study of all fetuses with RAA-no ICA diagnosed prenatally at three referral centers, between 2004 and 2014."

Our news journalists obtained a quote from the research from the University of Bologna, "A detailed sonographic examination was performed in each case, including visualization of the thymus and of the head and neck vessels to identify the presence of an aberrant left subclavian artery (ALSA). Karyotyping and fluorescence in situ hybridization analysis for diagnosis of 22q11.2 deletion were always offered either prenatally or postnatally. Clinical and echocardiographic examinations were performed in livebirths and a postmortem examination in cases of termination of pregnancy. During the study period, 85 fetuses were diagnosed prenatally with RAA-no ICA. Genetic or clinical data were not available for three cases and these were excluded from analysis. 22q11.2 deletion was found in 7/82 cases (8.5% (95% CI, 3.8-17.3%)). The thymus was small or non-visualized in all seven cases and additional abnormal sonographic findings were present in four. Conclusion 22q11.2 deletion is present in a clinically significant proportion of fetuses with a prenatal diagnosis of RAA-no ICA."
According to the news editors, the research concluded: "In such cases, a detailed sonographic examination, with assessment of the thymus in particular, may be useful to further define the level of risk for 22q11.2 deletion."

The news correspondents report that additional information may be obtained from G. Pilu, University of Bologna, Dept. of Obstet & Gynecol, Bologna, Italy. Additional authors for this research include V. De Robertis, I. Cataneo, N. Volpe, G. Campobasso, T. Frusca, T. Ghi, D. Prandstraller, G. Pilu and P. Volpe.

**Cardiovascular Diseases and Conditions -…**

**Studies from University of Bordeaux Yield New Data on Atherosclerosis (Solid Lipid Nanoparticles for Image-Guided Therapy of Atherosclerosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Atherosclerosis is now available. According to news reporting originating from Bordeaux, France, by NewsRx correspondents, research stated, "Although the application of nanotechnologies to atherosclerosis remains a young field, novel strategies are needed to address this public health issue. In this context, the magnetic resonance imaging (MRI) approach has been gradually investigated in order to enable image-guided treatments."

Financial support for this research came from Agence Nationale de la Recherche.

Our news editors obtained a quote from the research from the University of Bordeaux, "In this contribution, we report a new approach based on nucleoside-lipids allowing the synthesis of solid lipid nanoparticles (SLN) loaded with iron oxide particles and therapeutic agents. The insertion of nucleoside-lipids allows the formation of stable SLNs loaded with prostacycline (PGI2) able to inhibit platelet aggregation."

According to the news editors, the research concluded: "The new SLNs feature better relaxivity properties in comparison to the clinically used contrast agent Feridex, indicating that SLNs are suitable for image-guided therapy."

The news editors report that additional information may be obtained by contacting K. Oumzil, University of Bordeaux, ARNA laboratory , F-33000 Bordeaux, France. Additional authors for this research include M.A. Ramin, C. Lorenzato, A. Hemadou, J. Laroche, M.J. Jacobin-Valat, S. Mornet, C.E. Roy, T. Kauss, K. Gaudin, G. Clofent-Sanchez and P.
Studies from University of Bristol Update Current Data on Developmental Biology (Hypoxia promotes production of neural crest cells in the embryonic head)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Life Science Research - Developmental Biology have been presented. According to news reporting originating from Bristol, United Kingdom, by NewsRx correspondents, research stated, "Hypoxia is encountered in either pathological or physiological conditions, the latter of which is seen in amniote embryos prior to the commencement of a functional blood circulation. During the hypoxic stage, a large number of neural crest cells arise from the head neural tube by epithelial-to-mesenchymal transition (EMT)."

Financial support for this research came from Health Research Board.

Our news editors obtained a quote from the research from the University of Bristol, "As EMT-like cancer dissemination can be promoted by hypoxia, we investigated whether hypoxia contributes to embryonic EMT. Using chick embryos, we show that the hypoxic cellular response, mediated by hypoxia-inducible factor (HIF)-1 alpha, is required to produce a sufficient number of neural crest cells. Among the genes that are involved in neural crest cell development, some genes are more sensitive to hypoxia than others, demonstrating that the effect of hypoxia is gene specific. Once blood circulation becomes fully functional, the embryonic head no longer produces neural crest cells in vivo, despite the capability to do so in a hypoxia-mimicking condition in vitro, suggesting that the oxygen supply helps to stop emigration of neural crest cells in the head."

According to the news editors, the research concluded: "These results highlight the importance of hypoxia in normal embryonic development."

The news editors report that additional information may be obtained by contacting N. Itasaki, University of Bristol, Fac Hlth Sci, Bristol BS2 8EJ, Avon, United Kingdom. Additional authors for this research include E. Keane, E. Batt, P. Karunakaran, D.F. Higgins and N. Itasaki.

Blood Diseases and Conditions - Sepsis

Studies from University of British Columbia Add New Findings in the Area of Sepsis (Increased Plasma PCSK9 Levels Are Associated with Reduced Endotoxin Clearance and the Development of Acute Organ Failures during Sepsis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Blood Diseases and Conditions - Sepsis are presented in a new report. According to news reporting from Vancouver, Canada, by NewsRx journalists, research stated, "We have recently shown that PCSK9 reduces the clearance of endotoxin and is therefore a critical regulator of the innate immune response during infection. However, plasma PCSK9 levels during human sepsis and their relationship to outcomes are not known."

The news correspondents obtained a quote from the research from the University of British Columbia, "Our objective was to determine the relationship between plasma PCSK9 levels and the rate of endotoxin clearance, and then correlate PCSK9 levels with the development of acute organ failures in a cohort of patients with sepsis. Using human hepatocyte cells, we determined the threshold at which PCSK9 is able to reduce *Escherichia coli* endotoxin uptake by cultured human hepatocytes. In a single-centre observational cohort at St. Paul's Hospital in Vancouver, Canada, we recruited 200 patients who activated our Emergency Department's sepsis protocol and measured plasma PCSK9 and lipid levels at triage and throughout the admission. Outcomes were the development of sepsis-induced cardiovascular or respiratory failure. We reviewed the literature and determined that the normal human range of PCSK9 found in plasma is 170-220 ng/ml, while levels of 250 ng/ml and above reduced *E. coli* endotoxin clearance in cultured human hepatocytes. In septic patients, the median levels associated with new-onset respiratory and cardiovascular failure were 370 (250-500) and 380 (270-530) ng/ml, respectively, versus 270 (220-380) ng/ml in patients who did not go on to develop any organ failure (p=0.003 and 0.005, respectively). Plasma PCSK9 levels are greatly increased in sepsis. At normal levels, PCSK9 has no influence upon hepatocyte bacterial endotoxin clearance, but as levels rise, there is a progressive inhibition of clearance. During sepsis, PCSK9 levels are highly correlated with the development of subsequent multiple organ failure."

According to the news reporters, the research concluded: "Inhibition of PCSK9 activity is an attractive target for treating the spectrum of sepsis and septic shock."

Our news journalists report that additional information may be obtained by contacting J.H. Boyd, Centre for Heart Lung Innovation, University of British Columbia,
Vancouver, BC, Canada. Additional authors for this research include C.D. Fjell, J.A. Russell, D. Sirounis, M.S. Cirstea and K.R Walley.

Membrane Proteins - Immunologic Receptors

Studies from University of British Columbia Have Provided New Data on Immunologic Receptors (Activin B induces human endometrial cancer cell adhesion, migration and invasion by up-regulating integrin b3 via SMAD2/3 signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Membrane Proteins - Immunologic Receptors are discussed in a new report. According to news reporting from Vancouver, Canada, by NewsRx journalists, research stated, "Endometrial cancer is the fourth most common female cancer and the most common gynecological malignancy. Although it comprises only ~10% of all endometrial cancers, the serous histological subtype accounts for ~40% of deaths due to its aggressive behavior and propensity to metastasize."

The news correspondents obtained a quote from the research from the University of British Columbia, "Histopathological studies suggest that elevated expression of activin/inhibin bB subunit is associated with reduced survival in non-endometrioid endometrial cancers (type II, mostly serous). However, little is known about the specific roles and mechanisms of activin B (bB dimer) in serous endometrial cancer growth and progression. In the present study, we examined the biological functions of activin B in type II endometrial cancer cell lines, HEC-1B and KLE. Our results demonstrate that treatment with activin B increases cell migration, invasion and adhesion to vitronectin, but does not affect cell viability. Moreover, we show that activin B treatment increases integrin b3 mRNA and protein levels via SMAD2/3-SMAD4 signaling. Importantly, siRNA knockdown studies revealed that integrin b3 is required for basal and activin B-induced cell migration, invasion and adhesion."

According to the news reporters, the research concluded: "Our results suggest that activin B-SMAD2/3-integrin b3 signaling could contribute to poor patient survival by promoting the invasion and/or metastasis of type II endometrial cancers."

For more information on this research see: Activin B induces human endometrial cancer cell adhesion, migration and invasion by up-regulating integrin b3 via SMAD2/3 signaling. Oncotarget, 2015;6(31):31659-73.

gamma-Aminobutyric Acid

Studies from University of British Columbia Reveal New Findings on gamma-Aminobutyric Acid (Differential effects of R-isovaline and the GABAB agonist, baclofen, in the guinea pig ileum)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on gamma-Aminobutyric Acid is now available. According to news reporting originating from Vancouver, Canada, by NewsRx correspondents, research stated, "R-isovaline is a non-proteinogenic amino acid which produces analgesia in a range of nociceptive assays. Mediation of this effect by metabotropic receptors for gamma-aminobutyric acid (GABA) and glutamate, demonstrated by previous work, may depend on the type of tissue or receptor system."

Financial supporters for this research include Anesthesia Memorial Fund, UBC Faculty of Medicine.

Our news editors obtained a quote from the research from the University of British Columbia, "The objective of this study was to assess the activity of R-isovaline acting at GABA (B) and group II metabotropic glutamate receptors in guinea pig ileum, which is known to exhibit well-defined responses to GABA(B) agonists such as baclofen. The effects of bath-applied R-isovaline and RS-baclofen were examined on electrically evoked contractions of guinea pig ileum and during GABA(B) antagonism by CGP52432. In separate experiments, the group II metabotropic glutamate receptor agonist, LY354740 was applied to determine the functional presence of these receptors. R-isovaline (1-100 mM) decreased the amplitude of ileal muscle contractions and increased tension. RS-baclofen reduced contraction amplitude, but decreased tension. CGP52432 did not prevent the effects of R-isovaline on contraction amplitude, but antagonized effects of RS-baclofen on contraction amplitude. The group II metabotropic glutamate receptor agonist, LY354740, produced no detectable effects on evoked contractions. R-isovaline differed significantly from RS-baclofen in its actions in the guinea pig ileum, indicated in particular by the finding that CGP52432 blocked only the effects of RS-baclofen. The ileal tissue did not respond to a group II metabotropic glutamate receptor agonist, previously shown to co-mediate R-isovaline analgesia."

According to the news editors, the research concluded: "These findings raise the possibility of a novel therapeutic target at unknown receptors for R-isovaline-like compounds in the guinea pig ileum."

For more information on this research see: Differential effects of R-isovaline and the GABAB agonist, baclofen, in the guinea pig ileum. European Journal of Pharmacology, 2016;791():85-90. Cardiovascular Diseases and Conditions - Thrombosis

Studies from University of Buenos Aires Describe New Findings in Thrombosis (Neutrophil extracellular trap formation and circulating nucleosomes in patients with chronic myeloproliferative neoplasms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Thrombosis have been published. According to news reporting out of Buenos Aires, Argentina, by NewsRx editors, research stated, "The mechanisms underlying increased thrombotic risk in chronic myeloproliferative neoplasms (MPN) are incompletely understood. We assessed whether neutrophil extracellular traps (NETs), which promote thrombosis, contribute to the procoagulant state in essential thrombocythemia, polycythemia vera and myelofibrosis (MF) patients."

Our news journalists obtained a quote from the research from the University of Buenos Aires, "Although MPN neutrophils showed increased basal reactive oxygen species (ROS), enhanced NETosis by unstimulated neutrophils was an infrequent finding, whereas PMA-triggered NETosis was impaired, particularly in MF, due to decreased PMA-triggered ROS production. Elevated circulating nucleosomes were a prominent finding and were higher in patients with advanced disease, which may have potential prognostic implication. Histone-MPO complexes, proposed as specific NET biomarker, were seldomly detected, suggesting NETs may not be the main source of nucleosomes in most patients, whereas their correlation with high LDH points to increased cell turn-over as a plausible origin. Lack of association of nucleosomes or NETs with thrombosis or activation markers does not support their use as predictors of thrombosis although prospective studies in a larger cohort may help define their potential contribution to MPN thrombosis."

According to the news editors, the research concluded: "These results do not provide evidence for relevant in vivo NETosis in MPN patients under steady state conditions, although availability of standardized NET biomarkers may contribute to further research in this field."

For more information on this research see: Neutrophil extracellular trap formation and circulating nucleosomes in patients with chronic myeloproliferative neoplasms. Scientific
Studies from University of California Add New Findings in the Area of Fatty Liver (In vivo bioluminescence imaging reveals copper deficiency in a murine model of nonalcoholic fatty liver disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Liver Diseases and Conditions - Fatty Liver are discussed in a new report. According to news reporting out of Berkeley, California, by NewsRx editors, research stated, "Copper is a required metal nutrient for life, but global or local alterations in its homeostasis are linked to diseases spanning genetic and metabolic disorders to cancer and neurodegeneration. Technologies that enable longitudinal in vivo monitoring of dynamic copper pools can help meet the need to study the complex interplay between copper status, health, and disease in the same living organism over time."

Our news journalists obtained a quote from the research from the University of California, "Here, we present the synthesis, characterization, and in vivo imaging applications of Copper-Caged Luciferin-1 (CCL-1), a bioluminescent reporter for tissue-specific copper visualization in living animals. CCL-1 uses a selective copper(I)-dependent oxidative cleavage reaction to release D-luciferin for subsequent bioluminescent reaction with firefly luciferase. The probe can detect physiological changes in labile Cu+ levels in live cells and mice under situations of copper deficiency or overload. Application of CCL-1 to mice with liver-specific luciferase expression in a diet-induced model of nonalcoholic fatty liver disease reveals onset of hepatic copper deficiency and altered expression levels of central copper trafficking proteins that accompany symptoms of glucose intolerance and weight gain."

According to the news editors, the research concluded: "The data connect copper dysregulation to metabolic liver disease and provide a starting point for expanding the toolbox of reactivity-based chemical reporters for cell-and tissue-specific in vivo imaging."

For more information on this research see: In vivo bioluminescence imaging reveals copper deficiency in a murine model of nonalcoholic fatty liver disease. Musculoskeletal Diseases and Conditions - Kyphosis

Studies from University of California Add New Findings in the Area of Kyphosis (SHBG, Sex Steroids, and Kyphosis in Older Men: The MrOS Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Musculoskeletal Diseases and Conditions - Kyphosis. According to news originating from La Jolla, California, by NewsRx correspondents, research stated, "Accentuated kyphosis is associated with adverse health outcomes, including falls and fractures. Low bone density is a risk factor for hyperkyphosis, and each vertebral fracture adds roughly 4 degrees to forward spine curvature."

Our news journalists obtained a quote from the research from the University of California, "Sex steroids, in particular low bioavailable estradiol and high sex hormone-binding globulin (SHBG), are associated with bone loss and high SHBG is associated with vertebral fractures in older men. We, therefore, hypothesized that low bioavailable estradiol and high SHBG would be associated with worse kyphosis. To test this hypothesis, we examined the cross-sectional associations between individual bioavailable sex hormones and SHBG with radiographically assessed kyphosis. Participants included 1500 men aged 65 and older from the Osteoporotic Fractures in Men (MrOS) Study, in whom baseline measures of kyphosis and sex hormones were available. Modified Cobb angle of kyphosis, calculated from T4 through T12, was assessed from supine lateral spine radiographs. Serum total estradiol and total testosterone were measured by mass spectrometry, and bioavailable sex steroids were calculated from mass action equations. After adjustment for age and other confounding variables, no association was found between bioavailable estradiol or testosterone and Cobb angle, either when kyphosis was analyzed as a continuous variable or dichotomized into highest versus lower three quartiles. In linear regression models adjusted for age and clinic site, there was a significant association between SHBG and kyphosis (parameter estimate=0.76 per SD increase, p=0.01). In the fully adjusted model, this association was weakened and of only borderline statistical significance (parameter estimate=0.61 per SD, p=0.05). Logistic models demonstrated similar findings. Although associated with bone loss, we did not demonstrate that low bioavailable estradiol
translates into worse kyphosis in older men. High SHBG is associated with bone loss and vertebral fractures."

According to the news editors, the research concluded: "Our results suggest that high SHBG may also be a risk factor for hyperkyphosis."

The news correspondents report that additional information may be obtained from G.N. Woods, University of California, La Jolla, CA 92093, United States. Additional authors for this research include M.H. Huang, P.M. Cawthon, G.A. Laughlin, J.T. Schousboe, C. McDaniels-Davidson, J.A. Cauley, E. Orwoll, E. Barrett-Connor and D.M. Kado.

**Drugs and Therapies - Clinical Pharmacology and...**

**Studies from University of California Describe New Findings in Clinical Pharmacology and Therapeutics (Leveraging big data to transform target selection and drug discovery)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Clinical Pharmacology and Therapeutics have been published. According to news reporting from San Francisco, California, by NewsRx journalists, research stated, "The advances of genomics, sequencing, and high throughput technologies have led to the creation of large volumes of diverse datasets for drug discovery. Analyzing these datasets to better understand disease and discover new drugs is becoming more common."

Financial support for this research came from National Institute of General Medical Sciences of the National Institutes of Health.

The news correspondents obtained a quote from the research from the University of California, "Recent open data initiatives in basic and clinical research have dramatically increased the types of data available to the public. The past few years have witnessed successful use of big data in many sectors across the whole drug discovery pipeline."

According to the news reporters, the research concluded: "In this review, we will highlight the state of the art in leveraging big data to identify new targets, drug indications, and drug response biomarkers in this era of precision medicine."

For more information on this research see: Leveraging big data to transform target selection and drug discovery. *Clinical Pharmacology and Therapeutics*, 2016;99(3):285-97. (Nature Publishing Group - www.nature.com/; Clinical Pharmacology and Therapeutics - www.nature.com/clpt/)

Oncology - Prostate Cancer

Studies from University of California Describe New Findings in Prostate Cancer (Development and validation of a 24-gene predictor of response to postoperative radiotherapy in prostate cancer: a matched, retrospective analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Prostate Cancer. According to news reporting originating from San Francisco, California, by NewsRx correspondents, research stated, "Postoperative radiotherapy has an important role in the treatment of prostate cancer, but personalised patient selection could improve outcomes and spare unnecessary toxicity. We aimed to develop and validate a gene expression signature to predict which patients would benefit most from postoperative radiotherapy."

Our news editors obtained a quote from the research from the University of California, "Patients were eligible for this matched, retrospective study if they were included in one of five published US studies (cohort, case-cohort, and case-control studies) of patients with prostate adenocarcinoma who had radical prostatectomy (with or without postoperative radiotherapy) and had gene expression analysis of the tumour, with long-term follow-up and complete clinicopathological data. Additional treatment after surgery was at the treating physician's discretion. In each cohort, patients who had postoperative radiotherapy were matched with patients who had not had radiotherapy using Gleason score, prostate-specific antigen concentration, surgical margin status, extracapsular extension, seminal vesicle invasion, lymph node invasion, and androgen deprivation therapy. We constructed a matched training cohort using patients from one study in which we developed a 24-gene Post-Operative Radiation Therapy Outcomes Score (PORTOS). We generated a pooled matched validation cohort using patients from the remaining four studies. The primary endpoint was the development of distant metastasis. In the training cohort (n=196), among patients with a high PORTOS (n=39), those who had radiotherapy had a lower incidence of distant metastasis than did patients who did not have radiotherapy, with a 10-year metastasis rate of 5% (95% CI 0-14) in patients who had radiotherapy (n=20) and 63% (34-80) in patients who did not have radiotherapy (n=19; hazard ratio [HR] 0.12 [95% CI 0.03-0.41], p<0.0001), whereas among patients with a low PORTOS (n=157), those who had postoperative radiotherapy (n=78) had a greater incidence of distant metastasis at 10 years than did their untreated counterparts (n=79; 57% [44-67] vs 31% [20-41]; HR 2.5 [1.6-4.1], p<0.0001), with a significant treatment interaction (p(interaction) <0.0001).
The finding that PORTOS could predict outcome due to radiotherapy treatment was confirmed in the validation cohort (n=330), which showed that patients who had radiotherapy had a lower incidence of distant metastasis compared with those who did not have radiotherapy, but only in the high PORTOS group (high PORTOS [n=82]: 4% [95% CI 0-10] in the radiotherapy group [n=57] vs 35% [95% CI 7-54] in the no radiotherapy group [n=25] had metastasis at 10 years; HR 0.15 [95% CI 0.04-0.60], p=0.0020; low PORTOS [n=248]: 32% [95% CI 19-43] in the radiotherapy group [n=108] vs 32% [95% CI 22-40] in the no radiotherapy group [n=140]; HR 0.92 [95% CI 0.56-1.51], p=0.76), with a significant interaction (p(interaction) =0.016). The conventional prognostic tools Decipher, CAPRA-S, and microarray version of the cell cycle progression signature did not predict response to radiotherapy (p(interaction) >0.05 for all). Patients with a high PORTOS who had postoperative radiotherapy were less likely to have metastasis at 10 years than those who did not have radiotherapy, suggesting that treatment with postoperative radiotherapy should be considered in this subgroup."

According to the news editors, the research concluded: "PORTOS should be investigated further in additional independent cohorts."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/S1470-2045(16)30491-0. This DOI is a link to an online electronic document that is either free or for purchase.

prevent killing of self-cells, while enabling killing of MHC I-deficient cells. But tolerance also occurs for NK cells that lack inhibitory receptors for self-MHC I, and for all NK cells in MHC I-deficient animals."

Our news editors obtained a quote from the research from the University of California, "In both cases, NK cells are unresponsive to MHC I-deficient cells and hyporesponsive when stimulated through activating receptors, suggesting that hyporesponsiveness is responsible for self-tolerance. We generated irradiation chimeras, or carried out adoptive transfers, with wild-type (WT) and/or MHC I-deficient hematopoietic cells in WT or MHC I-deficient C57BL/6 host mice. Unexpectedly, in WT hosts, donor MHC I-deficient hematopoietic cells failed to induce hyporesponsiveness to activating receptor stimulation, but did induce tolerance to MHC I-deficient grafts. Therefore, these two properties of NK cells are separable. Both tolerance and hyporesponsiveness occurred when the host was MHC I deficient. Interestingly, infections of mice or exposure to inflammatory cytokines reversed the tolerance of NK cells that was induced by MHC I-deficient hematopoietic cells, but not the tolerance induced by MHC I-deficient nonhematopoietic cells."

According to the news editors, the research concluded: "These data have implications for successful bone marrow transplantation, and suggest that tolerance induced by hematopoietic cells versus nonhematopoietic cells may be imposed by distinct mechanisms."

For more information on this research see: Differential Role of Hematopoietic and Nonhematopoietic Cell Types in the Regulation of NK Cell Tolerance and Responsiveness. *Journal of Immunology*, 2016;197(10):4127-4136. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. **Oncology - Pancreatic Cancer**

**Studies from University of California Have Provided New Data on Pancreatic Cancer (Irinotecan Delivery by Lipid-Coated Mesoporous Silica Nanoparticles Shows Improved Efficacy and Safety over Liposomes for Pancreatic Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Pancreatic Cancer are presented in a new report. According to news originating from Los Angeles, California, by NewsRx correspondents, research stated, "Urgent intervention is required to improve the 5 year survival rate of pancreatic ductal adenocarcinoma (PDAC). While the four-drug regimen, FOLFIRINOX (comprising
irinotecan, 5-fluorouracil, oxaliplatin, and leucovorin), has a better survival outcome than the more frequently used gemcitabine, the former treatment platform is highly toxic and restricted for use in patients with good performance status."

Financial supporters for this research include Hirshberg Foundation for Pancreatic Cancer Research, U.S. Public Health Service.

Our news journalists obtained a quote from the research from the University of California, "Since irinotecan contributes significantly to FOLFIRINOX toxicity (bone marrow and gastrointestinal tract), our aim was to reduce the toxicity of this drug by a custom-designed mesoporous silica nanoparticle (MSNP) platform, which uses a proton gradient for high-dose irinotecan loading across a coated lipid bilayer (LB). The improved stability of the LB-coated MSNP (LB-MSNP) carrier allowed less drug leakage systemically with increased drug concentrations at the tumor sites of an orthotopic Kras-derived PDAC model compared to liposomes. The LB-MSNP nanocarrier was also more efficient for treating tumor metastases. Equally important, the reduced leakage and slower rate of drug release by the LB-MSNP carrier dramatically reduced the rate of bone marrow, gastrointestinal, and liver toxicity compared to the liposomal carrier."

According to the news editors, the research concluded: "We propose that the combination of high efficacy and reduced toxicity by the LB-MSNP carrier could facilitate the use of irinotecan as a first-line therapeutic to improve PDAC survival."

The news correspondents report that additional information may be obtained from X. Liu, Division of NanoMedicine, Dept. of Medicine, University of California, Los Angeles, California 90095, United States. Additional authors for this research include A. Situ, Y. Kang, K.R. Villabroza, Y. Liao, C.H. Chang, T. Donahue, A.E. Nel and H. Meng.

Studies from University of California Reveal New Findings on Brachytherapy (A method for restricting intracatheter dwell time variance in high-dose-rate brachytherapy plan optimization)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Brachytherapy have been published. According to news reporting originating in San Francisco, California, by NewsRx journalists, research stated,
"To present the algorithm of a modification to the inverse planning simulated annealing (IPSA) optimization engine that allows for restriction of the intracatheter dwell time variance. IPSA was modified to allow user control of dwell time variance within each catheter through a single parameter, the dwell time deviation constraint (DTDC)."

The news reporters obtained a quote from the research from the University of California, "The minimum DTDC value (DTDC = 0) does not impose any restriction on dwell time variance, and the maximum value (DTDC = 1) restricts all dwell times within each catheter to take on the same value. The final optimization penalty function value was evaluated as a function of DTDC. The algorithm proposed fully preserves the inverse planning nature of the IPSA algorithm along with the penalty-based dose optimization workflow. Increasing DTDC creates less variance in dwell time between dwell positions in each catheter and may be used to induce a more smooth change in dwell time with dwell position in each catheter. Nonzero DTDC values always increased the optimization penalty function value. The DTDC was developed as an extension to IPSA to allow restriction of the difference in dwell time between adjacent dwell positions. This results in less variation between neighboring dwell positions which can be clinically desirable."

According to the news reporters, the research concluded: "However, the impact of this restriction needs to be considered for its clinical relevance on a case-by-case basis because considerable degradation in dose-volume histogram metrics can result for large DTDC values."

Our news correspondents report that additional information may be obtained by contacting A. Cunha, University of California, Radiat Oncol, San Francisco, CA 94115, United States. Additional authors for this research include T. Siauw, I.C. Hsu and J. Pouliot.

Mycobacterium Infections - Tuberculosis

Studies from University of California Yield New Information about Tuberculosis (Xpert MTB/RIF Assay Shows Faster Clearance of Mycobacterium tuberculosis DNA with Higher Levels of Rifapentine Exposure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Mycobacterium Infections - Tuberculosis is now available. According to news reporting originating from San Francisco, California, by NewsRx correspondents, research stated, "The Xpert MTB/RIF assay is both sensitive and specific as a diagnostic test. Xpert also reports quantitative output in cycle threshold (C-T) values, which may provide a dynamic measure of sputum bacillary burden when used longitudinally."

Financial supporters for this research include HHS | National Institutes of Health
Our news editors obtained a quote from the research from the University of California, "We evaluated the relationship between Xpert C-T trajectory and drug exposure during tuberculosis (TB) treatment to assess the potential utility of Xpert C-T for treatment monitoring. We obtained serial sputum samples from patients with smear-positive pulmonary TB who were consecutively enrolled at 10 international clinical trial sites participating in study 29X, a CDC-sponsored Tuberculosis Trials Consortium study evaluating the tolerability, safety, and antimicrobial activity of rifapentine at daily doses of up to 20 mg/kg of body weight. Xpert was performed at weeks 0, 2, 4, 6, 8, and 12. Longitudinal C-T data were modeled using a nonlinear mixed effects model in relation to rifapentine exposure (area under the concentration-time curve [AUC]). The rate of change of C-T was higher in subjects receiving rifapentine than in subjects receiving standard-dose rifampin. Moreover, rifapentine exposure, but not assigned dose, was significantly associated with rate of change in C-T (P = 0.02). The estimated increase in C-T slope for every additional 100 μg. h/ml of rifapentine drug exposure (as measured by AUC) was 0.11 C-T/week (95% confidence interval [CI], 0.05 to 0.17). Increasing rifapentine exposure is associated with a higher rate of change of Xpert C-T, indicating faster clearance of Mycobacterium tuberculosis DNA."

According to the news editors, the research concluded: "These data suggest that the quantitative outputs of the Xpert MTB/RIF assay may be useful as a dynamic measure of TB treatment response."

For more information on this research see: Xpert MTB/RIF Assay Shows Faster Clearance of Mycobacterium tuberculosis DNA with Higher Levels of Rifapentine Exposure. *Journal of Clinical Microbiology*, 2016;54(12):3028-3033. *Journal of Clinical Microbiology* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA.

Autoimmune Diseases and Conditions - Sjogren's…

Studies from University of California in the Area of Sjogren's Syndrome Reported (Epigenetic Signatures of Salivary Gland Inflammation in Sjogren's Syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Autoimmune Diseases and Conditions - Sjogren's Syndrome. According to news reporting from San Francisco, California, by NewsRx journalists, research stated, "Sjogren's syndrome (SS) is a complex multisystem autoimmune disease that results in progressive destruction of the exocrine glands. The purpose of this study was to characterize epigenetic changes in affected gland tissue and describe the relationship of these changes to known inflammatory processes."

The news correspondents obtained a quote from the research from the University of California, "A genome-wide DNA methylation study was performed on human labial salivary gland (LSG) biopsy samples obtained from 28 female members of the Sjogren's International Collaborative Clinical Alliance (SICCA) Registry. Gland tissue was methylotyped using the Illumina HumanMethylation450 BeadChip platform, followed by rigorous probe-filtering and data-normalization procedures. A genome-wide case-control study of 26 of the 28 subjects revealed 7,820 differentially methylated positions (DMPs) associated with disease status, including 5,699 hypomethylated and 2,121 hypermethylated DMPs. Further analysis identified 57 genes that were enriched for DMPs in their respective promoters; many are involved in immune response, including 2 previously established SS genetic risk loci. Bioinformatics analysis highlighted an extended region of hypomethylation surrounding PSMB8 and TAP1, consistent with an increased frequency of antigen-presenting cells in LSG tissue from the SS cases. Transcription factor motif enrichment analysis revealed the specific nature of the genome-wide methylation differences, demonstrating colocalization of SS-associated DMPs with stress- and immune response-related motifs. Our findings underscore the utility of CpG methylation as an independent probe of active disease processes in SS, offering unique insights into the composition of disease-relevant tissue."

According to the news reporters, the research concluded: "Methylation profiling implicated several genes and pathways previously thought to be involved in disease-related processes, as well as a number of new candidates."

For more information on this research see: Epigenetic Signatures of Salivary Gland Inflammation in Sjogren's Syndrome. Arthritis & Rheumatology, 2016;68(12):2936-2944. Arthritis & Rheumatology can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news journalists report that additional information may be obtained by contacting L.A. Criswell, University of California, Russell Engleman Rheumatol Res Center, San Francisco, CA 94143, United States. Additional authors for this research include H. Quach, D. Quach, A. Baker, K.E. Taylor, L.F. Barcellos and L.A. Criswell.

Studies from University of Cambridge Further Understanding of Tuberculosis (Wild-Type and Non-Wild-Type Mycobacterium tuberculosis MIC Distributions for the Novel Fluoroquinolone Antofloxacin Compared with Those for Ofloxacin, Levofloxacin, and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Mycobacterium Infections - Tuberculosis is now available. According to news originating from Cambridge, United Kingdom, by NewsRx correspondents, research stated, "Antofloxacin (AFX) is a novel fluoroquinolone that has been approved in China for the treatment of infections caused by a variety of bacterial species. We investigated whether it could be repurposed for the treatment of tuberculosis by studying its in vitro activity."

Our news journalists obtained a quote from the research from the University of Cambridge, "We determined the wild-type and non-wild-type MIC ranges for AFX as well as ofloxacin (OFX), levofloxacin (LFX), and moxifloxacin (MFX), using the microplate alamarBlue assay, of 126 clinical Mycobacterium tuberculosis strains from Beijing, China, of which 48 were OFX resistant on the basis of drug susceptibility testing on Lowenstein-Jensen medium. The MIC distributions were correlated with mutations in the quinolone resistance-determining regions of gyrA (Rv0006) and gyrB (Rv0005). Pharmacokinetic/pharmacodynamic (PK/PD) data for AFX were retrieved from the literature. AFX showed lower MIC levels than OFX but higher MIC levels than LFX and MFX on the basis of the tentative epidemiological cutoff values (ECOFFs) determined in this study. All strains with non-wild-type MICs for AFX harbored known resistance mutations that also resulted in non-wild-type MICs for LFX and MFX. Moreover, our data suggested that the current critical concentration of OFX for Lowenstein-Jensen medium that was recently revised by the World Health Organization might be too high, resulting in the misclassification of phenotypically non-wildtype strains with known resistance mutations as wild type."

According to the news editors, the research concluded: "On the basis of our exploratory PK/PD calculations, the current dose of AFX is unlikely to be optimal for the treatment of tuberculosis, but higher doses could be effective."

For more information on this research see: Wild-Type and Non-Wild-Type Mycobacterium tuberculosis MIC Distributions for the Novel Fluoroquinolone Antofloxacin Compared with Those for Ofloxacin, Levofloxacin, and Moxifloxacin. Antimicrobial Agents and Chemotherapy, 2016;60(9):5232-5237. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. The direct object identifier (DOI) for that additional information is:
Studies from University of Cambridge Have Provided New Data on Liposomes (Controlling Self-Assembly Kinetics of DNA-Functionalized Liposomes Using Toehold Exchange Mechanism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Biotechnology - Liposomes. According to news reporting originating from Cambridge, United Kingdom, by NewsRx correspondents, research stated, "The selectivity of Watson-Crick base pairing has allowed the design of DNA-based functional materials bearing an unprecedented level of accuracy. Examples include DNA origami, made of tiles assembling into arbitrarily complex shapes, and DNA-coated particles featuring rich phase behaviors."

Funders for this research include Engineering and Physical Sciences Research Council, Emmanuel College, University of Cambridge, OppenheimerFunds.

Our news editors obtained a quote from the research from the University of Cambridge, "Frequently, the realization of conceptual DNA-nanotechnology designs has been hampered by the lack of strategies for effectively controlling relaxations. In this article, we address the problem of kinetic control on DNA-mediated interactions between Brownian objects. We design a kinetic pathway based on toehold-exchange mechanisms that enables rearrangement of DNA bonds without the need for thermal denaturation, and test it on suspensions of DNA-functionalized liposomes, demonstrating tunability of aggregation rates over more than 1 order of magnitude."

According to the news editors, the research concluded: "While the possibility to design complex phase behaviors using DNA as a glue is already well recognized, our results demonstrate control also over the kinetics of such systems."

The news editors report that additional information may be obtained by contacting L. Parolini, Biological and Soft Systems, Cavendish Laboratory, University of Cambridge, JJ Thomson Avenue, Cambridge CB3 0HE, UK. Additional authors for this research include J. Kotar, L. Di Michele and B.M Moggetti.
The direct object identifier (DOI) for that additional information is:

**Mycobacterium Infections - Tuberculosis**

**Studies from University of Cape Town Have Provided New Data on Tuberculosis (Selected questions and controversies about bedaquiline: a view from the field)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Mycobacterium Infections - Tuberculosis. According to news reporting from Cape Town, South Africa, by NewsRx journalists, research stated, "Although there has been a slow decline in tuberculosis (TB) incidence worldwide, the prevalence of drug resistant TB in most high-burden countries has increased. Drug-resistant TB is associated with high mortality, is a threat to health care workers in TB endemic countries and is prohibitively costly, which diverts resources away from drug-susceptible cases."

The news correspondents obtained a quote from the research from the University of Cape Town, "Amplification of resistance means that there is an increasing proportion of patients with multidrug-resistant TB who have extensively drug-resistant TB (XDR-TB) or are programmatically untreatable. Thus, new treatment options are urgently needed. Bedaquiline (BDQ) is the first new drug specifically developed for TB to be licensed for use in almost 40 years. BDQ has sterilising activity and also shows promise as a component of new treatment-shortening regimens for drug-susceptible TB. Here we review insights from the field into the use of BDQ, issues relevant to the practising clinician, implications for the selection for antiretroviral therapy, pharmacokinetic issues relevant to clinical practice and implications for combination therapy."

According to the news reporters, the research concluded: "Given the increasing prevalence of resistance beyond XDR-TB, we also discuss how the development of resistance to BDQ can be minimised."

For more information on this research see: Selected questions and controversies about bedaquiline: a view from the field. *International Journal of Tuberculosis and Lung Disease*, 2016;20(12):S24-S32. *International Journal of Tuberculosis and Lung Disease* can be contacted at: Int Union Against Tuberculosis Lung Disease (I U A T L D), 68 Boulevard Saint-Michel, 75006 Paris, France.

Our news journalists report that additional information may be obtained by contacting K. Dheda, University of Cape Town, Dept. of Med, Lung Inst, Cape Town, South Africa. Additional authors for this research include A. Esmail, J. Limberis and G. Maartens.

Studies from University of Chicago Have Provided New Data on Science (Gene expression in local stroma reflects breast tumor states and predicts patient outcome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Science. According to news reporting out of Chicago, Illinois, by NewsRx editors, research stated, "The surrounding microenvironment has been implicated in the progression of breast tumors to metastasis. However, the degree to which metastatic breast tumors locally reprogram stromal cells as they disrupt tissue boundaries is not well understood."

Our news journalists obtained a quote from the research from the University of Chicago, "We used species-specific RNA sequencing in a mouse xenograft model to determine how the metastasis suppressor RKIP influences transcription in a panel of paired tumor and stroma tissues. We find that gene expression in metastatic breast tumors is pervasively correlated with gene expression in local stroma of both mouse xenografts and human patients. Changes in stromal gene expression elicited by tumors better predicts subtype and patient survival than tumor gene expression, and genes with coordinated expression in both tissues predict metastasis-free survival."

According to the news editors, the research concluded: "These observations support the use of stroma-based strategies for the diagnosis and prognosis of breast cancer."

Our news journalists report that additional information may be obtained by contacting Y. Gilad, University Chicago, Dept. of Human Genet, Chicago, IL 60637, United States. Additional authors for this research include C. Frankenberger, D. Rabe, G. An, Y. Gilad and M.R. Rosner.

Cytoplasmic Structures

Studies from University of Chicago in the Area of Cytoplasmic Structures Described (Role of IQGAP1 in endothelial barrier enhancement caused by OxPAPC)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cytoplasmic Structures are discussed in a new report. According to news reporting originating from Chicago, Illinois, by NewsRx correspondents, research stated, "Oxidized 1-palmitoyl-2-arachidonoyl-sn-glycero-3-phosphatidylcholine
(OxPAPC) attenuates agonist-induced endothelial cell (EC) permeability and increases pulmonary endothelial barrier function via enhancement of both the peripheral actin cytoskeleton and cell junctions mediated by Rac1 and Cdc42 GTPases. This study evaluated the role for the multifunctional Rac1/Cdc42 effector and regulator, IQ domain containing GTPase-activating protein (IQGAP1), as a molecular transducer of the OxPAPC-mediated EC barrier-enhancing signal."

Financial supporters for this research include NHLBI, HHS | NIH | National Institute of General Medical Sciences (NIGMS).

Our news editors obtained a quote from the research from the University of Chicago, "IQGAP1 knockdown in endothelial cells by gene-specific small-interfering RNA abolished OxPAPC-induced enlargement of VE-cadherin-positive adherens junctions, suppressed peripheral accumulation of actin polymerization regulators, namely cortactin, neural Wiskott-Aldrich syndrome protein (N-WASP), and actin-related protein 3, and attenuated remodeling of the peripheral actin cytoskeleton. Inhibition of OxPAPC-induced barrier enhancement by IQGAP1 knockdown was due to suppressed Rac1 and Cdc42 activation. Expression of an IQGAP1 truncated mutant showed that the GTPase regulatory domain of IQGAP1 was essential for the OxPAPC-induced membrane localization of cortactin, adherens junction proteins VE-cadherin and p120-catenin, as well as for EC permeability response. IQGAP1 knockdown attenuated the protective effect of OxPAPC against thrombin-induced cell contraction, cell junction disruption, and EC permeability."

According to the news editors, the research concluded: "These results demonstrate for the first time the role of IQGAP1 as a critical transducer of OxPAPC-induced Rac1/Cdc42 signaling to the actin cytoskeleton and adherens junctions, which promotes cortical cytoskeletal remodeling and EC barrier-protective effects of oxidized phospholipids."

For more information on this research see: Role of IQGAP1 in endothelial barrier enhancement caused by OxPAPC. American Journal of Physiology-Lung Cellular and Molecular Physiology, 2016;311(4):L800-L809. American Journal of Physiology-Lung Cellular and Molecular Physiology can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

The news editors report that additional information may be obtained by contacting K.G. Birukov, University Chicago, Dept. of Med, Sect Pulm & Crit Care Med, Chicago, IL 60637, United States. Oncology - Chronic Lymphocytic Leukemia

Studies from University of Cologne Provide New Data on Chronic Lymphocytic Leukemia (State-of-the-Art Treatment and Novel Agents in Chronic Lymphocytic Leukemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Chronic Lymphocytic Leukemia. According to news reporting originating from Cologne, Germany, by NewsRx correspondents, research stated, "Chemoimmunotherapy is the established first-line treatment of patients with chronic lymphocytic leukemia (CLL) who do not display the high-risk genetic features del(17p) and/or TP53 mutation: Physically fit patients without or with only mild comorbidities should receive fludarabine, cyclophosphamide and rituximab, while bendamustine and rituximab can be considered in fit elderly patients of over 65 years and in patients with a higher risk of infections. Patients with relevant coexisting conditions should receive chlorambucil with a CD20 antibody, preferably obinutuzumab."

Our news editors obtained a quote from the research from the University of Cologne, "Patients with a del(17p) and/or TP53 mutation respond poorly to conventional chemo(immuno) therapies. However, the recently approved BTK and PI3K inhibitors ibrutinib and idelalisib have the best efficacy ever documented in patients with these high-risk genomic alterations and/or refractory CLL. The choice between ibrutinib and idelalisib should be based on the patients' comorbidities and concomitant medications since both agents have a distinct toxicity profile, although they are generally well tolerated in the majority of patients. For treatment of patients with a late relapse, chemoimmunotherapy instead of kinase inhibitors is still a reasonable approach, but has to be determined for every patient individually."

According to the news editors, the research concluded: "Further targeted drugs and their combinations are currently being evaluated in clinical trials and have the potential to eradicate all residual CLL cells and thus lead to a cure of CLL."

For more information on this research see: State-of-the-Art Treatment and Novel Agents in Chronic Lymphocytic Leukemia. Oncology Research and Treatment, 2016;39(1-2):25-32.

The news editors report that additional information may be obtained by contacting P. Cramer, Dept. of I of Internal Medicine, Center of Integrated Oncology Cologne-Bonn and German CLL Study Group, University of Cologne, Cologne, Germany. Additional authors for this research include M. Hallek and B. Eichhorst.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000443903. This DOI is a link to an online electronic document that is either free or for purchase.

Studies from University of Colorado Have Provided New Information about Cardiovascular and Thoracic Surgery (Rapamycin Decreases the Osteogenic Response in Aortic Valve Interstitial Cells Through the Stat3 Pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Surgery - Cardiovascular and Thoracic Surgery are discussed in a new report. According to news reporting from Aurora, Colorado, by NewsRx journalists, research stated, "Calcific aortic valve disease (CAVD) is an age-related and slowly progressive valvular disorder. We have previously found that the increased inflammatory and osteogenic responses to Toll-like receptor 4 (TLR4) stimulation is correlated with lower signal transducer and activator of transcription 3 (Stat3) activity in aortic valve interstitial cells (AVICs)."

The news correspondents obtained a quote from the research from the University of Colorado, "Rapamycin, a drug used clinically, induces feedback activation of Akt. Akt in turn may upregulate Stat3. Therefore we hypothesized that rapamycin will decrease TLR4-induced osteogenic response in human AVICs through modulation of Stat3 activity. AVICs were isolated from normal valves taken from the explanted hearts of patients undergoing transplantation. Cells were treated with TLR4 ligand lipopolysaccharide (LPS) or rapamycin, or both. The osteogenic markers runt-related transcription factor 2 (RUNX2), alkaline phosphatase (ALP), and bone morphogenetic protein 2 (BMP-2), as well as activation of Stat3 and its associated signaling molecules, were analyzed. LPS induces the expression of RUNX2, ALP, and BMP-2. Rapamycin decreased both the baseline and LPS-induced expression of RUNX2, ALP, and BMP-2. Rapamycin also decreased calcium deposit formation. Rapamycin activated both Stat3 and Akt in AVICs. Suppression of Akt resulted in abolishment of Stat3 activation. Inhibition of Stat3 enhanced expression of RUNX2, ALP, and BMP-2 at baseline and in response to LPS. Rapamycin inhibits TLR4-induced osteogenic responses in AVICs by activation of Stat3 through Akt."

According to the news reporters, the research concluded: "Rapamycin may alleviate inflammation-induced initiation and progression of CAVD."

Our news journalists report that additional information may be obtained by contacting J. Jaggers, University of Colorado, Dept. of Cardiothorac Surg, Aurora, CO, United States. Additional authors for this research include X.Z. Meng, R. Song, D. Fullerton and J. Jaggers.

Studies from University of Colorado in the Area of Antiretrovirals

Reported (Analysis of the Endogenous Deoxynucleoside Triphosphate Pool in HIV-Positive and -Negative Individuals Receiving Tenofovir-Emtricitabine)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antiretrovirals is the subject of a report. According to news reporting from Aurora, Colorado, by NewsRx journalists, research stated, "Tenofovir (TFV) disoproxil fumarate (TDF) and emtricitabine (FTC), two nucleos(t)ide analogs (NA), are coformulated as an anti-HIV combination tablet for treatment and preexposure prophylaxis (PrEP). TDF/FTC may have effects on the deoxynucleoside triphosphate (dNTP) pool due to their similar structures and similar metabolic pathways."

Financial support for this research came from HHS | NIH | NIH Office of the Director (OD).

The news correspondents obtained a quote from the research from the University of Colorado, "We carried out a comprehensive clinical study to characterize the effects of TDF/FTC on the endogenous dNTP pool, from baseline to 30 days of TDF/FTC therapy, in both treatment-naive HIV-positive and HIV-negative individuals. dATP, dCTP, dGTP, and TTP were quantified in peripheral blood mononuclear cells (PBMC) with a validated liquid chromatography-tandem mass spectrometry (LC-MS/MS) methodology. Forty individuals (19 HIV-positive) were enrolled and underwent a baseline visit and then received TDF/FTC for at least 30 days. Longitudinal measurements were analyzed using mixed-model segmented linear regression analysis. The dNTPs were reduced by 14% to 37% relative to the baseline level within 3 days in both HIV-negative and HIV-positive individuals (P <= 0.003). These reductions persisted to various degrees at day 30. These findings indicate that dNTP pools are influenced by TDF/FTC therapy. This may alter cellular homeostasis and could increase the antiviral effect through a more favorable analog/dNTP ratio."

According to the news reporters, the research concluded: "Further work is needed to elucidate mechanisms, to evaluate the clinical significance of these findings, and to further probe differences between HIV-negative and HIV-positive individuals."

For more information on this research see: Analysis of the Endogenous Deoxynucleoside Triphosphate Pool in HIV-Positive and -Negative Individuals Receiving Tenofovir-Emtricitabine. Antimicrobial Agents and Chemotherapy, 2016;60(9):5387-5392. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Studies from University of Colorado in the Area of Right Ventricular Reported (A Zero-Dimensional Model and Protocol for Simulating Patient-Specific Pulmonary Hemodynamics From Limited Clinical Data)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Right Ventricular are discussed in a new report. According to news reporting out of Aurora, Colorado, by NewsRx editors, research stated, "In pulmonary hypertension (PH) diagnosis and management, many useful functional markers have been proposed that are unfeasible for clinical implementation. For example, assessing right ventricular (RV) contractile response to a gradual increase in pulmonary arterial (PA) impedance requires simultaneously recording RV pressure and volume, and under different afterload/preload conditions."

Our news journalists obtained a quote from the research from the University of Colorado, "In addition to clinical applications, many research projects are hampered by limited retrospective clinical data and could greatly benefit from simulations that extrapolate unavailable hemodynamics. The objective of this study was to develop and validate a 0D computational model, along with a numerical implementation protocol, of the RV-PA axis. Model results are qualitatively compared with published clinical data and quantitatively validated against right heart catheterization (RHC) for 115 pediatric PH patients. The RV-PA circuit is represented using a general elastance function for the RV and a three-element Windkessel initial value problem for the PA. The circuit mathematically sits between two reservoirs of constant pressure, which represent the right and left atriums. We compared P-max, P-min, mPAP, cardiac output (CO), and stroke volume (SV) between the model and RHC. The model predicted between 96% and 98% of the variability in pressure and 98-99% in volumetric characteristics (CO and SV). However, Bland Altman plots showed the model to have a consistent bias for most pressure and volumetric parameters, and differences between model and RHC to have considerable error."

According to the news editors, the research concluded: "Future studies will address this issue and compare specific waveforms, but these initial results are extremely promising as preliminary proof of concept of the modeling approach."

Our news journalists report that additional information may be obtained by contacting V.O. Kheyfets, Univ Colorado Anschutz Med Campus, Childrens Hosp Colorado, Aurora, CO 80045, United States. Additional authors for this research include J. Dunning, U.
Studies from University of Connecticut Add New Findings in the Area of Atrial Fibrillation (Meta-analysis of ascorbic acid for prevention of postoperative atrial fibrillation after cardiac surgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Atrial Fibrillation is the subject of a report. According to news reporting out of Storrs, Connecticut, by NewsRx editors, research stated, "Results of a systematic review and meta-analysis of published data on use of ascorbic acid to prevent postoperative atrial fibrillation (POAF) after cardiac surgery are presented. MEDLINE and other sources were searched for reports on trials evaluating the effects of preoperative and/or postoperative use of ascorbic acid in patients undergoing cardiac surgery."

Our news journalists obtained a quote from the research from the University of Connecticut, "For each study selected for meta-analysis, an assessment for risks of methodological bias was performed. Data on POAF frequency and length of stay (LOS) outcomes were pooled and analyzed via random-effects modeling. The 11 identified studies involved patients receiving coronary artery bypass grafts with or without valve replacement; both i.v. and oral ascorbic acid formulations were used. Analysis of pooled outcomes data on treatment and control groups indicated that ascorbic acid prophylaxis was associated with reductions in POAF frequency (odds ratio, 0.44; 95% confidence interval [CI], 0.32 to 0.61), intensive care unit (ICU) LOS (difference in means, -0.24 day; 95% CI, -0.45 to -0.03 day), and total hospital LOS (difference in means, -0.94 day; 95% CI, -1.65 to -0.23 day). Significant statistical, methodological, and clinical heterogeneity were observed."

According to the news editors, the research concluded: "A meta-analysis revealed that, compared with use of a placebo or a nonplacebo control, perioperative administration of ascorbic acid to patients undergoing cardiac surgery was associated with a reduced frequency of POAF and a shorter ICU LOS and total hospital LOS."

For more information on this research see: Meta-analysis of ascorbic acid for prevention of postoperative atrial fibrillation after cardiac surgery. American Journal of Health-System Pharmacy, 2016;73(24):2056-2066. American Journal of Health-System Pharmacy can be contacted at: Amer Soc Health-System Pharmacists, 7272 Wisconsin Ave, Bethesda, MD 20814, USA.

Hematology - Perfusion Research

Studies from University of Copenhagen Provide New Data on Perfusion Research (Does depth of the frontal sinus affect near-infrared spectroscopy measurement?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematology - Perfusion Research. According to news reporting from Copenhagen, Denmark, by NewsRx journalists, research stated, "Near-infrared spectroscopy (NIRS) is a non-invasive method that reflects real-time cerebral oxygenation (rSO2(2)) by the use of two adhesive optodes placed on the forehead of the patient."

The news correspondents obtained a quote from the research from the University of Copenhagen, "Frontal sinuses vary anatomically and a large frontal sinus might compromise the NIRS signal since the NIRS optodes are placed at the skin surface superficial to the underlying frontal sinus. The aim of this case-series was to elucidate whether there is a difference in the obligate changes in rSO2 during cardiac surgery between patients with a small as opposed to a large anterior-posterior distance of the frontal sinus based on magnetic resonance imaging."

According to the news reporters, the research concluded: "Two matched groups with small (n = 5) vs. large (n = 5) frontal sinus (3.2 vs. 18.1 millimeters) in this case-series showed no difference in obligate changes of rSO(2) (p = 0.54)."

For more information on this research see: Does depth of the frontal sinus affect near-infrared spectroscopy measurement? Perfusion-Uk, 2016;31(8):659-661. Perfusion-Uk can be contacted at: Sage Publications Ltd, 1 Olivers Yard, 55 City Road, London EC1Y 1SP, England.

Our news journalists report that additional information may be obtained by contacting F. Holmgaaard, University of Copenhagen, Center Heart, Rigshospitalet, Dept. of Cardiothorac Anesthesiol, DK-2100 Copenhagen, Denmark. Additional authors for this research include A.G. Vedel, A. Langkilde, J.C. Nilsson and H.B. Ravn.

Skin Diseases and Conditions - Rosacea

Studies from University of Copenhagen Reveal New Findings on Rosacea (Nationwide Assessment of Cause-Specific Mortality in Patients with Rosacea: A Cohort Study in Denmark)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Skin Diseases and Conditions - Rosacea have been presented. According to news originating from Hellerup, Denmark, by NewsRx correspondents, research stated, "Emerging data suggest that rosacea is associated with several comorbidities; however, the causes of mortality in patients with rosacea have not yet been investigated. We evaluated all-cause and cause-specific death rates in patients with rosacea in a population-based Danish cohort study."

Our news journalists obtained a quote from the research from the University of Copenhagen, "All Danish individuals aged aeyen18 years between 1 January 1997 and 31 December 2012 with rosacea diagnosed by hospital dermatologists were linked in nationwide registers and compared with age- and sex-matched general-population subjects (1:5 ratio). Death rates were calculated per 1000 person-years, and hazard ratios (HRs) were estimated using Cox regression models. The total cohort (n = 35,958) included 5993 patients with rosacea and 29,965 age- and sex-matched individuals from the general population. During the maximum 15 years of follow-up, 664 (11.1 %) patients with rosacea and 3121 (10.4 %) patients in the reference population died. The risk of all-cause mortality was similar in patients with rosacea and the reference population [HR 1.06, 95 % confidence interval (CI) 0.98-1.15]. Analyses of cause-specific mortality revealed a significantly increased risk of death due to gastrointestinal diseases in patients with rosacea (HR 1.95, 95 % CI 1.31-2.89), primarily related to hepatic disease. No increased risk of death due to other major disease categories, e.g. cancer, cardiovascular, neurological, or infectious diseases was observed. We observed a significantly increased risk of death due to gastrointestinal diseases (primarily hepatic disease) in patients with rosacea; however, we found no increased risk of death due to other causes such as cardiovascular or neurological diseases."

According to the news editors, the research concluded: "Although this does not necessarily imply a causal link, the findings underscore the association between rosacea and gastrointestinal disease, but also that rosacea may be associated with increased risk factors, including alcohol consumption."

The news correspondents report that additional information may be obtained from A. Egeberg, University of Copenhagen, Herlev & Gentofte Hosp, Dept. of Dermatol & Allergy, DK-2900 Hellerup, Denmark. Additional authors for this research include J.F. Fowler, G.H. Gislason and J.P. Thyssen.

Studies from University of Douala Reveal New Findings on Cardiovascular Disease and Conditions (Prevalence and factors associated with hyperuricaemia in newly diagnosed and untreated hypertensives in a sub-Saharan African setting)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Health and Medicine - Cardiovascular Disease and Conditions. According to news reporting out of Douala, Cameroon, by NewsRx editors, research stated, "Background.-Few studies have evaluated the link between hyperuricaemia and cardiovascular disease in sub-Saharan Africa. Aims.-To assess the prevalence of and factors associated with hyperuricaemia among newly diagnosed treatment-naive hypertensive patients in sub-Saharan Africa."

Our news journalists obtained a quote from the research from the University of Douala, "Methods.-We performed a Community-based cross-sectional study from January to December 2012 in Douala, Cameroon (Central Africa). We enrolled newly diagnosed treatment-naive hypertensive patients, and excluded those with gout or a history of gout. Serum uric acid concentrations were measured by enzymatic colourimetric methods, and hyperuricaemia was defined as a serum uric acid concentration > 70 IU/mL. Fasting blood sugar concentrations, serum creatinine concentrations and lipid profiles were also measured. Logistic regression was used to study factors associated with hyperuricaemia. We included 839 newly diagnosed treatment-naive hypertensive patients (427 women and 412 men; mean age 51 +/- 11 years; mean serum uric acid concentration 60.5 +/- 16.5 IU/L). The prevalence of hyperuricaemia was 31.8% (95% confidence interval [CI] 28.7-34.9) and did not differ by sex (132 women vs. 135 men; P=0.56). Multivariable logistic regression identified age > 55 years (adjusted odds ratio [AOR] 1.65, 95% CI 1.12-2.29), family history of hypertension (AOR 1.65, 95% CI 1.01-2.67), waist circumference > 102 cm in men or > 88 cm in women (AOR 1.60, 95% CI 1.12-2.29), low-density lipoprotein cholesterol > 1 g/L (AOR 1.33, 95% CI 0.97-1.82) and triglycerides > 1.5 g/L (AOR 1.63, 95% CI 1.01-2.65) as independently associated with hyperuricaemia."

According to the news editors, the research concluded: "Hyperuricaemia is common among newly diagnosed treatment-naive hypertensive patients in sub-Saharan Africa and is associated with some components of the metabolic syndrome."

For more information on this research see: Prevalence and factors associated with hyperuricaemia in newly diagnosed and untreated hypertensives in a sub-Saharan African setting. Archives of Cardiovascular Diseases, 2016;109(10):527-532. Archives of Cardiovascular Diseases can be contacted at: Elsevier Masson, Via Paleocapa 7, 20121 Milano, Italy. Studies from University of Dundee Reveal New Findings on Therapeutics (Current perceptions of the term Clinical Pharmacy and its relationship to Pharmaceutical Care: a survey of members of the European Society of Clinical Pharmacy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Therapeutics have been presented. According to news reporting originating in Dundee, United Kingdom, by NewsRx journalists, research stated, "The definitions that are being used for the terms 'clinical pharmacy' and 'pharmaceutical care' seem to have a certain overlap. Responsibility for therapy outcomes seems to be especially linked to the latter term."

The news reporters obtained a quote from the research from the University of Dundee, "Both terms need clarification before a proper definition of clinical pharmacy can be drafted. To identify current disagreements regarding the term 'Clinical Pharmacy' and its relationship to 'Pharmaceutical Care' and to assess to which extent pharmacists with an interest in Clinical Pharmacy are willing to accept responsibility for drug therapy outcomes."

According to the news reporters, the research concluded: "The membership of the European Society of Clinical Pharmacy."

Our news correspondents report that additional information may be obtained by contacting T. Dreischulte, University of Dundee, Div Populat Hlt Sci, Dundee, United Kingdom.

Cardiovascular Diseases

Studies from University of Edinburgh Have Provided New Information about Cardiovascular Diseases (Large animal models of cardiovascular disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases. According to news originating from Midlothian, United Kingdom, by NewsRx correspondents, research stated, "The human cardiovascular system is a complex arrangement of specialized structures with distinct functions. The molecular landscape, including the genome, transcriptome and proteome, is pivotal to the biological complexity of both normal and abnormal mammalian processes." Funders for this research include Biotechnology and Biological Sciences Research Council, Institute Career Path Fellowship, East of Scotland BioScience Doctoral Training Partnership.

Our news journalists obtained a quote from the research from the University of Edinburgh, "Despite our advancing knowledge and understanding of cardiovascular disease (CVD) through the principal use of rodent models, this continues to be an increasing issue in today's world. For instance, as the ageing population increases, so does the incidence of heart valve dysfunction. This may be because of changes in molecular composition and structure of the extracellular matrix, or from the pathological process of vascular calcification in which bone-formation related factors cause ectopic mineralization. However, significant differences between mice and men exist in terms of cardiovascular anatomy, physiology and pathology. In contrast, large animal models can show considerably greater similarity to humans. Furthermore, precise and efficient genome editing techniques enable the generation of tailored models for translational research. These novel systems provide a huge potential for large animal models to investigate the regulatory factors and molecular pathways that contribute to CVD in vivo."

According to the news editors, the research concluded: "In turn, this will help bridge the gap between basic science and clinical applications by facilitating the refinement of therapies for cardiovascular disease."

The news correspondents report that additional information may be obtained from H.G. Tsang, The Roslin Institute, Royal (Dick) School of Veterinary Studies, The University of Edinburgh, Easter Bush, Midlothian, SCT, UK. Additional authors for this research include N.A. Rashdan, C.B. Whitelaw, B.M. Corcoran, K.M. Summers and V.E MacRae.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/cbf.3173. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Antineoplastics

Studies from University of Edinburgh in the Area of Antineoplastics Described (Irinotecan metabolite SN38 results in germ cell loss in the testis but not in the ovary of prepubertal mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antineoplastics. According to news reporting out of Edinburgh, United Kingdom, by NewsRx editors, research stated, "Does the Irinotecan metabolite 7-ethyl-10-hydroxycamptothecan (SN38) damage the gonads of male and female prepubertal mice? The irinotecan metabolite SN38 reduces germ cell numbers within the seminiferous tubules of mouse testes at concentrations that are relevant to cancer patients, while in contrast it has little if any effect on the female germ cell population. Little is known about the role of the chemotherapeutic agent Irinotecan on female fertility, with only one article to date reporting menopausal symptoms in perimenopausal women treated with Irinotecan, while no data are available either on adult male fertility or on the impact of Irinotecan on the subsequent fertility of prepubertal cancer patients, female or male."

Funders for this research include Medical Research Grant (MRC), Children with Cancer UK.

Our news journalists obtained a quote from the research from the University of Edinburgh, "Male and female gonads were obtained from postnatal day 5 C57BL/6 mice and exposed in vitro to a range of concentrations of the Irinotecan metabolite SN38: 0.002, 0.01, 0.05, 0.1 or 1 A mu g ml(-1) for the testis and 0.1, 1, 2.5 or 5 A mu g ml(-1) for the ovary, with treated gonads compared to control gonads not exposed to SN38. SN38 was dissolved in 0.5% dimethyl sulfoxide, with controls exposed to the same concentration of diluent. The number of testis fragments used for each analysis ranged between 3 and 9 per treatment group, while the number of ovaries used for each analysis ranged between 4 and 12 per treatment group. Neonatal mouse gonads were developed in vitro, with tissue analysed at the end of the 4-6 day culture period, following immunofluorescence or hematoxylin and eosin staining. Statistical analyses were performed using one-way ANOVA followed by Bonferroni post-hoc test for normally distributed data and Kruskal-Wallis test followed by Dunns post-test for non-parametric data. Abnormal testis morphology was observed when tissues were exposed to SN38, with a smaller seminiferous tubule diameter at the highest concentration of SN38 (1 A mu g ml(-1), p< 0.001 versus control) and increased number of Sertoli cell-only tubules at the two highest concentrations of SN38 (0.1 A mu g ml(-1), p< 0.001; 1 A mu g ml(-1), p< 0.0001, both versus control). Within seminiferous tubules, a dose response decrease was observed in both germ cell number (mouse vasa homologue (MVH)-positive cells) and in proliferating cell number (bromodeoxyuridine (BrdU)-positive cells), with significance reached at the two highest concentrations of SN38 (0.1 A mu g ml(-1), p< 0.01 for both; 1 A mu g ml(-1), p< 0.001-MHV, p< 0.01-BrdU; all versus control). No change was seen in protein expression of the apoptotic marker cleaved caspase 3. Double immunofluorescence showed that occasional proliferating germ cells were present in treated testes, even after exposure to the highest drug concentration. When prepubertal ovaries were treated with SN38, no effect was seen on germ cell number, apoptosis or cell proliferation, even after exposure to the highest drug concentrations. As with any study using in vitro experiments with an experimental animal model, caution is required when extrapolating the present findings to humans. Differences between human and mouse spermatogonial development also need to be considered when assessing the effect of chemotherapeutic exposure. However, the prepubertal testes and ovaries used in the present
studies contain germ cell populations that are representative of those found in prepubertal patients, and experimental tissues were exposed to drug concentrations within the range found in patient plasma. Our findings demonstrate that the prepubertal mouse ovary is relatively insensitive to exposure to the Irinotecan metabolite SN38, while it induces a marked dose-dependent sensitivity in the testicular germ cell population. The study identifies the importance of further investigation to identify the risk of infertility in young male cancer patients treated with Irinotecan. None. Work supported by Medical Research Grant (MRC) grant G1002118 and Children with Cancer UK grant 15-198."

According to the news editors, the research concluded: "The authors declare that there is no conflict of interest that could prejudice the impartiality of the present research."

Our news journalists report that additional information may be obtained by contacting N. Spears, University of Edinburgh, Center Integrat Physiol, Edinburgh EH8 9XD, Midlothian, United Kingdom. Additional authors for this research include R. Smith, S. Nash, R.T. Mitchell and N. Spears.

Blood Pressure

Studies from University of Exeter Have Provided New Data on Blood Pressure (Improvement in blood pressure after short-term inorganic nitrate supplementation is attenuated in cigarette smokers compared to nonsmoking controls)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Blood Pressure is now available. According to news reporting originating in Exeter, United Kingdom, by NewsRx journalists, research stated, "Dietary supplementation with inorganic nitrate (NO3-) has been reported to improve cardiovascular health indices in healthy adults. Cigarette smoking increases circulating thiocyanate (SCN-), which has been suggested to competitively inhibit salivary nitrate (NO3-) uptake, a rate-limiting step in dietary NO3- metabolism."

The news reporters obtained a quote from the research from the University of Exeter, "Therefore, this study tested the hypothesis that dietary NO3- supplementation would be less effective at increasing the circulating plasma nitrite concentration ([NO2-]) and lowering blood pressure in smokers (S) compared to non-smokers (NS). Nine healthy smokers and eight healthy non-smoking controls reported to the laboratory at baseline (CON) and following six day
supplementation periods with 140 mL day⁻¹ NO₃--rich (8.4 mmol NO₃⁻ day⁻¹; NIT) and NO₃--depleted (0.08 mmol NO₃⁻ day⁻¹; PLA) beetroot juice in a cross-over experiment. Plasma and salivary [SCN⁻] were elevated in smokers compared to non-smokers in all experimental conditions (P < 0.05). Plasma and salivary [NO₃⁻] and [NO₂⁻] were elevated in the NIT condition compared to CON and PLA conditions in smokers and non-smokers (P < 0.05). However, the change in salivary [NO₃⁻] (S: 3.5 +/- 2.1 vs. NS: 7.5 +/- 4.4 mM), plasma [NO₃⁻] (S: 484 +/- 198 vs. NS: 802 +/- 199 pM) and plasma [NO₂⁻] (S: 218 +/- 128 vs. NS: 559 +/- 419 nM) between the CON and NIT conditions was lower in the smokers compared to the non-smokers (P < 0.05). Salivary [NO₂⁻] increased above CON to a similar extent with NIT in smokers and non-smokers (P > 0.05). Systolic blood pressure was lowered compared to PLA with NIT in non-smokers (P < 0.05), but not smokers (P > 0.05). These findings suggest that dietary NO₃⁻ metabolism is compromised in smokers leading to an attenuated blood pressure reduction compared to non-smokers after NO(3)(-)supplementation."

According to the news reporters, the research concluded: "These observations may provide novel insights into the cardiovascular risks associated with cigarette smoking and suggest that this population may be less likely to benefit from improved cardiovascular health if they increase dietary NO₃⁻ intake."

For more information on this research see: Improvement in blood pressure after short-term inorganic nitrate supplementation is attenuated in cigarette smokers compared to nonsmoking controls. Nitric Oxide-Biology and Chemistry, 2016;61():29-37. Nitric Oxide-Biology and Chemistry can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA.

Our news correspondents report that additional information may be obtained by contacting S.J. Bailey, University of Exeter, Sport & Hlth Sci, Coll Life & Environm Sci, Exeter, Devon, United Kingdom. Regional Development Fund (ERDF), UE, Junta de Extremadura, Ministerio de Ciencia e Innovacion, Federacion Espanola de Enfermedades Raras, FSE.

Our news journalists obtained a quote from the research from the University of Extremadura, "This study was intended to evaluate the in vitro effect of melatonin on the cytotoxic and pro-apoptotic actions of various chemotherapeutic agents in cervical cancer HeLa cells. Herein, we found that both melatonin and three of the chemotherapeutic drugs tested, namely cisplatin (CIS), 5-fluorouracil (5-FU), and doxorubicin, induced a decrease in HeLa cell viability. Furthermore, melatonin significantly increased the cytotoxic effect of such chemotherapeutic agents. Consistently, costimulation of HeLa cells with any chemotherapeutic agent in the presence of melatonin further increased caspase-3 activation, particularly in CIS- and 5-FU-challenged cells. Likewise, concomitant treatments with melatonin and CIS significantly enhanced the ratio of cells entering mitochondrial apoptosis due to reactive oxygen species (ROS) overproduction, substantially augmented the population of apoptotic cells, and markedly enlarged DNA fragmentation compared to the treatments with CIS alone. Nonetheless, melatonin only displayed moderate chemosensitizing effects in 5-FU-stimulated HeLa cells, as suggested by slight increments in the percentage of cells stimulated for ROS production and in the proportion of early apoptotic cells compared to the treatments with 5-FU alone."

According to the news editors, the research concluded: "In summary, our findings provided evidence that in vitro melatonin strongly enhances CIS-induced cytotoxicity and apoptosis in HeLa cells and, hence, the indoleamine could be potentially applied to cervical cancer treatment as a powerful synergistic agent."

The news correspondents report that additional information may be obtained from R. Pariente, Dept. of Physiology (Neuroimmunophysiology and Chrononutrition Research Group), Faculty of Science, University of Extremadura, Badajoz, Spain. Neurologic Diseases and Conditions - Syncope

Studies from University of Florence in the Area of Syncope Reported (Safety and tolerability of Tilt Testing and Carotid Sinus Massage in the octogenarians)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Neurologic Diseases and Conditions - Syncope are presented in a new report. According to news reporting from Florence, Italy, by NewsRx journalists, research stated, "to evaluate the safety and tolerability of Tilt Testing (TT) and Carotid Sinus Massage (CSM) in octogenarians with unexplained syncope, patients consecutively referred for transient loss of consciousness to the 'Syncope Units' of three hospitals were enrolled."

The news correspondents obtained a quote from the research from the University of Florence, "TT and CSM were performed according to the European Society of Cardiology guidelines on syncope. Complications were evaluated in each group. An early interruption of TT was defined as 'intolerance' and considered as a non-diagnostic response. One thousand four hundred and one patients were enrolled (mean age 72 ± 16 years, male 40.8%). Six hundred and ninety-four patients (49.5%) were 80 years old or older (mean age 83 ± 3 years) and 707 (50.5%) were younger (mean age 60 ± 17 years). Complications after TT occurred in 4.5% of older patients and in 2.1% of the younger ones (p=0.01). All complications were 'minor/moderate', as prolonged hypotension, observed in ≤3% of patients (≥80 years). Major complications such as sustained ventricular tachycardia, ventricular fibrillation, asystole requiring cardiac massage, transient ischaemic attack, stroke and death were not observed in any patient. The presence of orthostatic hypotension and the mean number of syncopal episodes were predictors of TT complications. Intolerance was reported in 2.4% of older patients and 1% of the younger ones (p=0.08), mainly due to orthostatic intolerance. No complications occurred after CSM."

According to the news reporters, the research concluded: "TT and CSM appear to be safe and well tolerated in octogenarians, who should not be excluded by age from the diagnostic work-up of syncope."

Our news journalists report that additional information may be obtained by contacting A. Ungar, Geriatric Cardiology and Medicine, University of Florence and Careggi Hospital, Florence, Italy. Additional authors for this research include G. Rivasi, M. Rafanelli, G. Toffanello, C. Mussi, A. Ceccofiglio, R. McDonagh, B. Drumm, N. Marchionni, P. Alboni and R.A Kenny.

Drugs and Therapies - Antibiotics

Studies from University of Florida Describe New Findings in Antibiotics [Population pharmacokinetics of enrofloxacin in purple sea stars (Pisaster ochraceus) following an intracoelomic injection or extended immersion]
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antibiotics. According to news originating from Gainesville, Florida, by NewsRx correspondents, research stated, "To determine population pharmacokinetics of enrofloxacin in purple sea stars (Pisaster ochraceus) administered an intracoelomic injection of enrofloxacin (5 mg/kg) or immersed in an enrofloxacin solution (5 mg/L) for 6 hours. ANIMALS 28 sea stars of undetermined age and sex."

Our news journalists obtained a quote from the research from the University of Florida, "PROCEDURES The study had 2 phases. Twelve sea stars received an intracoelomic injection of enrofloxacin (5 mg/kg) or were immersed in an enrofloxacin solution (5 mg/L) for 6 hours during the injection and immersion phases, respectively. Two untreated sea stars were housed with the treated animals following enrofloxacin administration during both phases. Water vascular system fluid samples were collected from 4 sea stars and all controls at predetermined times during and after enrofloxacin administration. The enrofloxacin concentration in those samples was determined by high-performance liquid chromatography. For each phase, noncompartmental analysis of naive averaged pooled samples was used to obtain initial parameter estimates; then, population pharmacokinetic analysis was performed that accounted for the sparse sampling technique used. Injection phase data were best fit with a 2-compartment model; elimination half-life, peak concentration, area under the curve, and volume of distribution were 42.8 hours, 18.9 μg/mL, 353.8 μg h/mL, and 0.25 L/kg, respectively. Immersion phase data were best fit with a 1-compartment model; elimination half-life, peak concentration, and area under the curve were 56 hours, 36.3 μg h/mL, and 0.39 μg/mL, respectively."

According to the news editors, the research concluded: "Results suggested that the described enrofloxacin administration resulted in water vascular system fluid drug concentrations expected to exceed the minimum inhibitory concentration for many bacterial pathogens."

For more information on this research see: Population pharmacokinetics of enrofloxacin in purple sea stars (Pisaster ochraceus) following an intracoelomic injection or extended immersion. *American Journal of Veterinary Research*, 2016;77(11):1266-1275. *American Journal of Veterinary Research* can be contacted at: Amer Veterinary Medical Assoc, 1931 N Meacham Rd Suite 100, Schaumburg, IL 60173-4360, USA.

Studies from University of Florida Further Understanding of Attention Deficit Hyperactivity Disorders (Development of a refill pattern method to measure polypharmacy in administrative claims databases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Developmental Diseases and Conditions - Attention Deficit Hyperactivity Disorders are discussed in a new report. According to news reporting originating in Gainesville, Florida, by NewsRx journalists, research stated, "The purposes of the study were to develop a refill pattern method to identify polypharmacy in pharmacy billing records and to compare the method with traditional days' supply overlap algorithms. This method is characterized by the assessment of prescription refill pattern."

The news reporters obtained a quote from the research from the University of Florida, "Concomitant therapy is assumed when two drugs are dispensed repeatedly during the active days' supply of each other. We tested the refill pattern method in a simplified scenario in which two drugs (methylphenidate/dexmethylphenidate and atomoxetine) for attention deficit/hyperactivity disorder (ADHD) were considered. Children who had at least one prescription of methylphenidate/dexmethylphenidate or atomoxetine in 2008 were included for the calculation of 2-year prevalence of ADHD treatment polypharmacy. Results were compared with traditional method that requires a minimum overlap of 30, 60 or 90 days of filled prescriptions. We compared polypharmacy prevalence estimated by the two methods and explored reasons for disagreement. Among 131 385 children who had at least one prescription of methylphenidate/dexmethylphenidate or atomoxetine, the refill pattern method identified 4021 patients who had ADHD treatment polypharmacy (2-year prevalence = 3.1%). This prevalence estimate fell between those from a 30- to 60-day overlap method. The Cohen's kappa regarding determination of polypharmacy was 0.83, 0.92 and 0.80 considering 90-, 60- and 30-day overlap method, respectively."

According to the news reporters, the research concluded: "The refill pattern method can be used as another way to measure polypharmacy in administrative claims databases and can be adapted to a wide variety of research questions, diseases and study populations."

Our news correspondents report that additional information may be obtained by contacting X.Y. Liu, University of Florida, Coll Pharm, Dept. of Pharmaceut Outcomes & Policy, Gainesville, FL 32610, United States. Additional authors for this research include P. Kubilis, R. Bussing and A.G. Winterstein.

Studies from University of Florida Further Understanding of Obesity (Dietary Patterns in Relation to General and Central Obesity among Adults in Southwest China)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting from Gainesville, Florida, by NewsRx journalists, research stated, "Dietary patterns represent a broader picture of food consumption, and are better correlated with a variety of health outcomes. However, few studies have been conducted to explore the associations between dietary patterns and obesity in Southwest China."

The news correspondents obtained a quote from the research from the University of Florida, "Data from the 2010-2012 National Nutrition Survey in the province of Yunnan, Southwest China, were analyzed (n = 1604, aged 18-80 years). Dietary data were collected using the 24 h dietary recall over three consecutive days. Height, weight, and waist circumference were measured following standard methods. Exploratory factor analysis was used to identify dietary patterns. Logistic regression was used to explore the association between dietary patterns and obesity. Three distinct dietary patterns were identified, which were labeled as traditional, modern, and tuber according to their key components. With potential confounders adjusted, adults in the highest quartile of the modern pattern were at higher risk of general and central obesity (odds ratio (OR) 1.95, 95% confidence interval (CI) 1.15-3.48; OR 2.01, 95% CI 1.37-2.93). In contrast, adults in the highest quartile of the tuber pattern were at lower risk of general and central obesity (OR 0.34, 95% CI 0.15-0.61; OR 0.64, 95% CI 0.43-0.95) but at higher risk of underweight (OR 2.57, 95% CI 1.20-6.45). No significant association was found between the traditional pattern and obesity. Moreover, dietary pattern differences occurred due to the differences in socio-demographic characteristics."

According to the news reporters, the research concluded: "The modern dietary pattern was positively, and the tuber pattern negatively, associated with general and central obesity among adults in Southwest China."

For more information on this research see: Dietary Patterns in Relation to General and Central Obesity among Adults in Southwest China. International Journal of Environmental Research and Public Health, 2016;13(11):601-611. Pharmacogenetics

Studies from University of Florida in the Area of Pharmacogenetics Described (Implementation of inpatient models of pharmacogenetics programs)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Pharmacogenetics are presented in a new report. According to news reporting from Gainesville, Florida, by NewsRx journalists, research stated, "The operational elements essential for establishing an inpatient pharmacogenetic service are reviewed, and the role of the pharmacist in the provision of genotype-guided drug therapy in pharmacogenetics programs at three institutions is highlighted. Pharmacists are well positioned to assume important roles in facilitating the clinical use of genetic information to optimize drug therapy given their expertise in clinical pharmacology and therapeutics."

The news correspondents obtained a quote from the research from the University of Florida, "Pharmacists have assumed important roles in implementing inpatient pharmacogenetics programs. This includes programs designed to incorporate genetic test results to optimize antiplatelet drug selection after percutaneous coronary intervention and personalize warfarin dosing. Pharmacist involvement occurs on many levels, including championing and leading pharmacogenetics implementation efforts, establishing clinical processes to support genotype-guided therapy, assisting the clinical staff with interpreting genetic test results and applying them to prescribing decisions, and educating other healthcare providers and patients on genomic medicine. The three inpatient pharmacogenetics programs described use reactive versus preemptive genotyping, the most feasible approach under the current third-party payment structure. All three sites also follow Clinical Pharmacogenetics Implementation Consortium guidelines for drug therapy recommendations based on genetic test results. With the clinical emergence of pharmacogenetics into the inpatient setting, it is important that pharmacists caring for hospitalized patients are well prepared to serve as experts in interpreting and applying genetic test results to guide drug therapy decisions."

According to the news reporters, the research concluded: "Since genetic test results may not be available until after patient discharge, pharmacists practicing in the ambulatory care setting should also be prepared to assist with genotype-guided drug therapy as part of transitions in care."

For more information on this research see: Implementation of inpatient models of pharmacogenetics programs. American Journal of Health-System Pharmacy, 2016;73 (23):1944-1954. Enzymes and Coenzymes - Phosphotransferases...

Studies from University of Fudan Have Provided New Information about Phosphotransferases (Alcohol Group Acceptor) (Pyruvate Kinase M2 Activates mTORC1 by Phosphorylating AKT1S1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Enzymes and Coenzymes - Phosphotransferases (Alcohol Group Acceptor) is the subject of a report. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "In cancer cells, the mammalian target of rapamycin complex 1 (mTORC1) that requires hormonal and nutrient signals for its activation, is constitutively activated. We found that overexpression of pyruvate kinase M2 (PKM2) activates mTORC1 signaling through phosphorylating mTORC1 inhibitor AKT1 substrate 1 (AKT1S1)."

The news correspondents obtained a quote from the research from the University of Fudan, "An unbiased quantitative phosphoproteomic survey identified 974 PKM2 substrates, including serine202 and serine203 (S202/203) of AKT1S1, in the proteome of renal cell carcinoma (RCC). Phosphorylation of S202/203 of AKT1S1 by PKM2 released AKT1S1 from raptor and facilitated its binding to 14-3-3, resulted in hormonal-and nutrient-signals independent activation of mTORC1 signaling and led accelerated oncogenic growth and autophagy inhibition in cancer cells. Decreasing S202/203 phosphorylation by TEPP-46 treatment reversed these effects. In RCCs and breast cancers, PKM2 overexpression was correlated with elevated S202/203 phosphorylation, activated mTORC1 and inhibited autophagy."

According to the news reporters, the research concluded: "Our results provided the first phosphorylome of PKM2 and revealed a constitutive mTORC1 activating mechanism in cancer cells."

For more information on this research see: Pyruvate Kinase M2 Activates mTORC1 by Phosphorylating AKT1S1. Scientific Reports, 2016;6():21524. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Studies from University of Grenoble Have Provided New Information about Chemotherapy (Cryptosporidium and Toxoplasma Parasites Are Inhibited by a Benzoxaborole Targeting Leucyl-tRNA Synthetase)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Chemotherapy. According to news originating from Grenoble, France, by NewsRx correspondents, research stated, "The apicomplexan parasites Cryptosporidium and Toxoplasma are serious threats to human health. Cryptosporidiosis is a severe diarrheal disease in malnourished children and immunocompromised individuals, with the only FDA-approved drug treatment currently being nitazoxanide."

Financial supporters for this research include EC | European Research Council (ERC), Chinese Academy of Sciences (CAS), Bill and Melinda Gates Foundation (Bill & Melinda Gates Foundation).

Our news journalists obtained a quote from the research from the University of Grenoble, "The existing therapies for toxoplasmosis, an important pathology in immunocompromised individuals and pregnant women, also have serious limitations. With the aim of developing alternative therapeutic options to address these health problems, we tested a number of benzoxaboroles, boron-containing compounds shown to be active against various infectious agents, for inhibition of the growth of Cryptosporidium parasites in mammalian cells. A 3-aminomethyl benzoxaborole, AN6426, with activity in the micromolar range and with activity comparable to that of nitazoxanide, was identified and further characterized using biophysical measurements of affinity and crystal structures of complexes with the editing domain of Cryptosporidium leucyl-tRNA synthetase (LeuRS). The same compound was shown to be active against Toxoplasma parasites, with the activity being enhanced in the presence of norvaline, an amino acid that can be mischarged by LeuRS."

According to the news editors, the research concluded: "Our observations are consistent with AN6426 inhibiting protein synthesis in both Cryptosporidium and Toxoplasma by forming a covalent adduct with tRNAleu in the LeuRS editing active site and suggest that further exploitation of the benzoxaborole scaffold is a valid strategy to develop novel, much needed antiparasitic agents."

For more information on this research see: Cryptosporidium and Toxoplasma Parasites Are Inhibited by a Benzoxaborole Targeting Leucyl-tRNA Synthetase. Antimicrobial Agents and Chemotherapy, 2016;60(10):5817-5827. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Transplant Medicine - Kidney Transplants

Studies from University of Groningen Reveal New Findings on Kidney Transplants (Iron deficiency, anemia, and mortality in renal transplant recipients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Transplant Medicine - Kidney Transplants is now available. According to news originating from Groningen, Netherlands, by NewsRx correspondents, research stated, "Anemia, iron deficiency anemia (IDA), and iron deficiency (ID) are highly prevalent in renal transplant recipients (RTR). Anemia is associated with poor outcome, but the role of ID is unknown."

Financial support for this research came from Dutch Top Institute Food and Nutrition.

Our news journalists obtained a quote from the research from the University of Groningen, "Therefore, we aimed to investigate the association of ID, irrespective of anemia, with all-cause mortality in RTR. Cox regression analyses were used to investigate prospective associations. In 700 RTR, prevalences of anemia, IDA, and ID were 34%, 13%, and 30%, respectively. During follow-up for 3.1 (2.7-3.9) years, 81 (12%) RTR died. In univariable analysis, anemia [HR, 1.72 (95% CI: 1.11-2.66), P = 0.02], IDA [2.44 (1.48-4.01), P< 0.001], and ID [2.04 (1.31-3.16), P = 0.001] were all associated with all-cause mortality. In multivariable analysis, the association of anemia with mortality became weaker after adjustment for ID [1.52 (0.97-2.39), P = 0.07] and disappeared after adjustment for proteinuria and eGFR [1.09 (0.67-1.78), P = 0.73]. The association of IDA with mortality attenuated after adjustment for potential confounders. In contrast, the association of ID with mortality remained independent of potential confounders, including anemia [1.77 (1.13-2.78), P = 0.01]."

According to the news editors, the research concluded: "ID is highly prevalent among RTR and is associated with an increased risk of mortality, independent of anemia. As ID is a modifiable factor, correction of ID could be a target to improve survival."

The news correspondents report that additional information may be obtained from M.F. Eisenga, University of Groningen, Groningen University Medical Center, Div Nephrol, Dept. of Internal Med, Groningen, Netherlands. Additional authors for this research include I. Minovic, S.P. Berger, J.E. Kootstra-Ros, E. van den Berg, I.J. Riphagen, G. Navis, P. van der Meer, S.J.L. Bakker and C. Gaillard.
The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/tri.12821. This DOI is a link to an online electronic document that is either free or for purchase.

Mosquito-Borne Diseases - West Nile Fever

Studies from University of Haifa in the Area of West Nile Fever Described (Transmission Dynamics of the West Nile Virus in Mosquito Vector Populations under the Influence of Weather Factors in the Danube Delta, Romania)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mosquito-Borne Diseases - West Nile Fever. According to news reporting out of Haifa, Israel, by NewsRx editors, research stated, "Mosquitoes were collected in the Danube Delta during the active seasons of 2011-2013. For Culex spp. mosquitoes, the abundance was calculated. Culex pipiens (sensu lato), (s.l.) and Culex modestus pools were tested for the presence of West Nile virus (WNV) genome, and the maximum likelihood of the infection rate was established."

Financial supporters for this research include European Union (EU) grant EDENext, UEFISCDI, Romania.

Our news journalists obtained a quote from the research from the University of Haifa, "Mean daily temperatures and precipitation were obtained for the closest meteorological station. A negative binominal model was used to evaluate linkages between the temperature/precipitation and mosquito population size. A zero-inflated negative binomial model was used to test the relationship between the temperature and the infection rate. A single complex model for infection rate prediction was also used. The linkages were calculated for lag 0 and for 10 days earlier (lag 1), 20 days earlier (lag 2), and 30 days earlier (lag 3). Significant positive linkages (P < 0.001) were detected between temperature and mosquito population size for lag 1, lag 2, and lag 3. The linkages between temperature and infection rates were positive and significant for lag 2 and lag 3. Negative significant (P < 0.001) results were detected between precipitation and infection rates for lags 1, 2, and 3. The complex model showed that the best predictors for infection rate are the temperature, 20 days earlier (positive linkage) and the precipitation, 30 days earlier (negative linkage)."

According to the news editors, the research concluded: "Positive temperature anomalies in spring and summer and rainfall decrease contributed to the increase in the Culex spp. abundance and accelerated the WNV amplification in mosquito vector populations in the following weeks."

For more information on this research see: Transmission Dynamics of the West Nile Virus in Mosquito Vector Populations under the Influence of Weather Factors in the Danube Delta, Romania.
Our news journalists report that additional information may be obtained by contacting S. Paz, University of Haifa, Dept. of Geog & Environm Studies, IL-349838 Haifa, Israel. Additional authors for this research include E. Falcuta, L.F. Prioteasa, S. Dinu, C.S. Ceianu and S. Paz.

**Apoptosis**

**Studies from University of Heidelberg Have Provided New Information about Apoptosis (Inhibition of AXUD1 attenuates compression-dependent apoptosis of cementoblasts)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Apoptosis have been presented. According to news reporting out of Heidelberg, Germany, by NewsRx editors, research stated, "Root resorptions are common undesirable side effects of orthodontic treatment. In most patients, these defects are repaired by cementoblasts."

Our news journalists obtained a quote from the research from the University of Heidelberg, "However, in 1-5% of patients, the repair fails. The repair mechanism is not well understood. Apoptosis of cementoblasts might contribute to an impaired repair of root resorptions induced by orthodontic forces. To gain insight into putative molecular pathways leading to compression-induced apoptosis of human primary cementoblasts (HPCBs), three independent cell populations were subjected to compressive loading at 5, 20, and 30 g/cm(2) for 1, 6, and 10 h. The mRNA expression of AXUD1, a novel pro-apoptotic gene, was monitored by quantitative reverse transcription PCR (qRT-PCR). To identify a possible function in compression-dependent apoptosis, AXUD1 was silenced in cementoblasts using an siRNA approach. Apoptosis of cementoblasts was measured by annexin V staining and flow cytometry. The phosphorylation of c-Jun-N-terminal kinases (JNKs) was investigated by Western blotting. AXUD1 was significantly induced in a time- and force-dependent manner. The rate of apoptotic HPCBs increased by 20-40% after 10 h of compression (30 g/cm(2)). Phosphorylation of JNKs was detected after 10 h at 30 g/cm(2). SiRNA-mediated knockdown of AXUD1 led to decreased phosphorylation of JNKs and reduced apoptosis rates in compressed HPCBs. Compression-induced apoptosis of HPCBs is mediated by AXUD1 via a JNK-dependent pathway. AXUD1-dependent apoptosis of human cementoblasts might contribute to an impaired repair of root resorptions during orthodontic tooth movement."

According to the news editors, the research concluded: "Further studies are needed to
develop treatment strategies aiming to minimize root resorption during orthodontic tooth movement."

For more information on this research see: Inhibition of AXUD1 attenuates compression-dependent apoptosis of cementoblasts. *Clinical Oral Investigations*, 2016;20 (9):2333-2341. *Clinical Oral Investigations* can be contacted at: Springer Heidelberg, Tiergartenstrasse 17, D-69121 Heidelberg, Germany. **Immune System Diseases and Conditions - HIV/AIDS**

**Studies from University of Heidelberg in the Area of HIV/AIDS Described (The structure and flexibility of conical HIV-1 capsids determined within intact virions)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immune System Diseases and Conditions - HIV/AIDS have been published. According to news reporting originating in Heidelberg, Germany, by NewsRx journalists, research stated, "HIV-1 contains a cone-shaped capsid encasing the viral genome. This capsid is thought to follow fullerene geometry-a curved hexameric lattice of the capsid protein, CA, closed by incorporating 12 CA pentamers."

The news reporters obtained a quote from the research from the University of Heidelberg, "Current models for core structure are based on crystallography of hexameric and cross-linked pentameric CA, electron microscopy of tubular CA arrays, and simulations. Here, we report subnanometer-resolution cryo-electron tomography structures of hexameric and pentameric CA within intact HIV-1 particles. Whereas the hexamer structure is compatible with crystallography studies, the pentamer forms using different interfaces. Determining multiple structures revealed how CA flexes to form the variably curved core shell."

According to the news reporters, the research concluded: "We show that HIV-1 CA assembles both aberrant and perfect fullerene cones, supporting models in which conical cores assemble de novo after maturation."

Our news correspondents report that additional information may be obtained by
contacting J.A.G. Briggs, Heidelberg University Medical Center European Mol Biol Lab, Mol Med Partnership Unit, Heidelberg, Germany. Additional authors for this research include B. Glass, W.J.H. Hagen, H.G. Krausslich and J.A.G. Briggs.

**Drugs and Therapies - Tricyclic Antidepressants**

**Studies from University of Houston Describe New Findings in Tricyclic Antidepressants [Characterization of Multiple Pathways Modulating Aggression in the Male Clouded Leopard (Neofelis nebulosa)]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Tricyclic Antidepressants is the subject of a report. According to news originating from Houston, Texas, by NewsRx correspondents, research stated, "Breeding clouded leopards (Neofelis nebulosa) ex situ has been a challenge, primarily due to extreme and often fatal male aggression toward females. This study's aim was to determine the degree to which two possible mechanisms-serotonergic pathways and circulating testosterone levels-affect aggressive behavior."

Our news journalists obtained a quote from the research from the University of Houston, "Male clouded leopard behavioral and hormonal data were collected during a series of behavior tests administered before and after treatment with either an anxiety-reducing tricyclic antidepressant (clomipramine) or a GnRH agonist (deslorelin). Results showed that clomipramine treatment decreased 'overall activity' (P = 0.054) and increased 'lying down' (P = 0.0043) and hiding in a 'nest box' (P = 0.0023). Clomipramine treatment also decreased the incidence of 'growling' during a mirror image stimulation test, relative to non-test periods (P <0.0001 pre-drug treatment; P = 0.242 peri-drug treatment), indicating reduced aggression. Suppression of the reproductive axis via deslorelin treatment resulted in significant decreases in circulating androgen (P <0.0001) and glucocorticoid (P <0.0001), accompanied by decreased aggressive behaviors, including 'swatting' (P = 0.0476), 'tail flicking' (P = 0.0409), and 'growling' during the behavior reaction tests: mirror image stimulation (P <0.0001 pre-drug treatment: P = 0.7098 peri-drug treatment) and unfamiliar people test (P <0.0001 pre-drug treatment: P = 0.2666 peri-drug treatment) relative to non-test periods."

According to the news editors, the research concluded: "Both drug treatments provide evidence that multiple mechanisms modulate aggressive behavior in the male clouded leopard, suggesting that serotonergic modulation coupled with circulating androgens may aid in the formation of successful breeding pairs."

For more information on this research see: Characterization of Multiple Pathways Modulating Aggression in the Male Clouded Leopard (Neofelis nebulosa). Zoo Biology,
Sensation Diseases and Conditions - Olfaction...

Studies from University of Iceland Reveal New Findings on Olfaction Disorders (Sniffing out significant "Pee values" genome wide association study of asparagus anosmia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Sensation Diseases and Conditions - Olfaction Disorders are presented in a new report. According to news reporting out of Reykjavik, Iceland, by NewsRx editors, research stated, "To determine the inherited factors associated with the ability to smell asparagus metabolites in urine. Genome wide association study."

Our news journalists obtained a quote from the research from the University of Iceland, "Nurses' Health Study and Health Professionals Follow-up Study cohorts. 6909 men and women of European-American descent with available genetic data from genome wide association studies. Participants were characterised as asparagus smellers if they strongly agreed with the prompt 'after eating asparagus, you notice a strong characteristic odor in your urine,' and anosmic if otherwise. We calculated per-allele estimates of asparagus anosmia for about nine million single nucleotide polymorphisms using logistic regression. P values <5x10^-8 were considered as genome wide significant. 58.0% of men (n=1449/2500) and 61.5% of women (n=2712/4409) had anosmia. 871 single nucleotide polymorphisms reached genome wide significance for asparagus anosmia, all in a region on chromosome 1 (1q44: 248139851-248595299) containing multiple genes in the olfactory receptor 2 (OR2) family. Conditional analyses revealed three independent markers associated with asparagus anosmia: rs13373863, rs71538191, and rs6689553. A large proportion of people have asparagus anosmia. Genetic variation near multiple olfactory receptor genes is associated with the ability of an individual to smell the metabolites of asparagus in urine."

According to the news editors, the research concluded: "Future replication studies are necessary before considering targeted therapies to help anosmic people discover what they are missing."

Our news journalists report that additional information may be obtained by
Studies from University of Illinois Describe New Findings in Aedes aegypti [Comparative Susceptibility of Ochlerotatus japonicus, Ochlerotatus triseriatus, Aedes albopictus, and Aedes aegypti (Diptera: Culicidae) to La Crosse Virus]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Mosquito Species - Aedes aegypti are discussed in a new report. According to news reporting originating from Champaign, Illinois, by NewsRx correspondents, research stated, "Invasive mosquito species can increase the transmission risk of native mosquito-borne diseases by acting as novel vectors. In this study, we examined the susceptibility of three exotic invasive mosquito species Aedes aegypti (L.), Ae. albopictus (Skuse), and Ochlerotatus japonicus (Theobald) to La Crosse virus (LACV) relative to the native primary vector Ochlerotatus triseriatus (Say)."

Our news editors obtained a quote from the research from the University of Illinois, "Adult females of the four mosquito species were orally challenged with LACV; incubated for 3, 5, 7, 9, or 11 d; and their midgut infection rates, dissemination rates, and effective vector competence were determined. Overall, Oc. japonicus (2.92) had the highest effective vector competence values, followed by Ae. albopictus (1.55), Ae. aegypti (0.88), and Oc. triseriatus (0.64). In addition, we assessed the relationship between mosquito size and LACV susceptibility for field-collected Oc. triseriatus and Oc. japonicus. We hypothesized that smaller adults would be more susceptible to LACV; however, our results did not support this hypothesis. Infected Oc. triseriatus tended to be larger than exposed but uninfected females, while infected and uninfected Oc. japonicus were similarly sized."

According to the news editors, the research concluded: "These findings suggest that Oc. japonicus, Ae. albopictus, and Ae. aegypti have significant potential to transmit LACV and more research is needed to uncover their potential role in LACV epidemiology."

The news editors report that additional information may be obtained by contacting J.J. Bara, University of Illinois, Illinois Nat Hist Survey, Champaign, IL 61820, United States. Additional authors for this research include A.T. Parker and E.J. Muturi.

Studies from University of Illinois Yield New Information about Phenylalanine [Melphalan 200mg/m(2) in patients with renal impairment is associated with increased short-term toxicity but improved response and longer treatment-free survival]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Phenylalanine have been published. According to news reporting originating in Chicago, Illinois, by NewsRx journalists, research stated, "Data on the effectiveness and toxicity of high-dose melphalan in patients with renal impairment (RI) are lacking. We evaluated the impact of RI on outcomes of patients with multiple myeloma treated with melphalan 200 mg/m(2) (Mel200) and autologous stem cell transplantation."

The news reporters obtained a quote from the research from the University of Illinois, "Similar baseline characteristics were seen among 46 patients with creatinine clearance (CrCl) <60 mL/min (median 50 mL/min, range 20-59) and 103 patients with CrCl >= 60 mL/min (median 83mL/min, range 60-128). Patients with CrCl <60 mL/min had longer time to neutrophil (P = 0.008) and platelet engraftment (P=0.001). Diarrhea, duration of total parenteral nutrition use and infection were significantly higher in the CrCl <60 mL/min group. With a median follow-up of 35 months (range 2-132) in the CrCl <60 mL/min group and 47 months (range 1-45) in the CrCl >= 60 mL/min group, overall survival was comparable between the two groups. Median treatment-free survival was longer in the RI group (37 vs 17 months, P = 0.0025). Multivariate analysis showed CrCl <60 mL/min (hazard ratio (HR) 3.5), and prior proteasome inhibitor therapy (HR 2.441) both predicted longer treatment-free survival."

According to the news reporters, the research concluded: "We consider Mel200 safe and effective in patients with CrCl between 30 and 60 mL/min."

For more information on this research see: Melphalan 200mg/m(2) in patients with renal impairment is associated with increased short-term toxicity but improved response and longer treatment-free survival. Oncology - Pancreatic Cancer

Studies from University of Kansas Medical Center Further Understanding of Pancreatic Cancer (Quinomycin A targets Notch signaling pathway in pancreatic cancer stem cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Pancreatic Cancer is the subject of a report. According to news reporting from Kansas City, Kansas, by NewsRx journalists, research stated, "Cancer stem cells (CSCs) appear to explain many aspects of the neoplastic evolution of tumors and likely account for enhanced therapeutic resistance following treatment. Dysregulated Notch signaling, which affects CSCs plays an important role in pancreatic cancer progression."

The news correspondents obtained a quote from the research from the University of Kansas Medical Center, "We have determined the ability of Quinomycin to inhibit CSCs and the Notch signaling pathway. Quinomycin treatment resulted in significant inhibition of proliferation and colony formation in pancreatic cancer cell lines, but not in normal pancreatic epithelial cells. Moreover, Quinomycin affected pancreatosphere formation. The compound also decreased the expression of CSC marker proteins DCLK1, CD44, CD24 and EPCAM. In addition, flow cytometry studies demonstrated that Quinomycin reduced the number of DCLK1+ cells. Furthermore, levels of Notch 1-4 receptors, their ligands Jagged1, Jagged2, DLL1, DLL3, DLL4 and the downstream target protein Hes-1 were reduced. The g-secretase complex proteins, Presenilin 1, Nicastrin, Pen2, and APH-1, required for Notch activation also exhibited decreased expression. Ectopic expression of the Notch Intracellular Domain (NICD) partially rescued the cells from Quinomycin mediated growth suppression. To determine the effect of Quinomycin on tumor growth in vivo, nude mice carrying tumor xenografts were administered Quinomycin intraperitoneally every day for 21 days. Treatment with the compound significantly inhibited tumor xenograft growth, coupled with significant reduction in the expression of CSC markers and Notch signaling proteins."

According to the news reporters, the research concluded: "Together, these data suggest that Quinomycin is a potent inhibitor of pancreatic cancer that targets the stem cells by inhibiting Notch signaling proteins."

For more information on this research see: Quinomycin A targets Notch signaling pathway in pancreatic cancer stem cells. Oncotarget, 2016;7(3):3217-32.

Membrane Proteins - Immunologic Receptors

Studies from University of Kentucky Have Provided New Information about Immunologic Receptors (Talin2-mediated traction force drives matrix degradation and cell invasion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Membrane Proteins - Immunologic Receptors are presented in a new report. According to news reporting originating in Lexington, Kentucky, by NewsRx journalists, research stated, "Talin binds to beta-integrin tails to activate integrins, regulating cell migration, invasion and metastasis. There are two talin genes, TLN1 and TLN2, encoding talin1 and talin2, respectively."

Funders for this research include Markey Cancer Center, University of Kentucky, American Cancer Society, Biotechnology and Biological Sciences Research Council.

The news reporters obtained a quote from the research from the University of Kentucky, "Talin1 regulates focal adhesion dynamics, cell migration and invasion, whereas the biological function of talin2 is not clear and, indeed, talin2 has been presumed to function redundantly with talin1. Here, we show that talin2 has a much stronger binding to beta-integrin tails than talin1. Replacement of talin2 Ser339 with Cys significantly decreased its binding to beta 1-integrin tails to a level comparable to that of talin1. Talin2 localizes at invadopodia and is indispensable for the generation of traction force and invadopodium-mediated matrix degradation. Ablation of talin2 suppressed traction force generation and invadopodia formation, which were restored by re-expressing talin2 but not talin1. Furthermore, re-expression of wild-type talin2 (but not talin2(S339C)) in talin2-depleted cells rescued development of traction force and invadopodia."

According to the news reporters, the research concluded: "These results suggest that a strong interaction of talin2 with integrins is required to generate traction, which in turn drives invadopodium-mediated matrix degradation, which is key to cancer cell invasion."

Our news correspondents report that additional information may be obtained by contacting C. Huang, University of Kentucky, Dept. of Pharmacol & Nutr Sci, Lexington, KY 40506, United States. Studies from University of Kentucky Yield New Data on Alzheimer Disease (Risk factors and global cognitive status related to brain arteriolosclerosis in elderly individuals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurodegenerative Diseases and Conditions - Alzheimer Disease have been published. According to news reporting originating in Lexington, Kentucky, by NewsRx journalists, research stated, "Risk factors and cognitive sequelae of brain arteriolosclerosis pathology are not fully understood. To address this, we used multimodal data from the National Alzheimer's Coordinating Center and Alzheimer's Disease Neuroimaging Initiative data sets."

The news reporters obtained a quote from the research from the University of Kentucky, "Previous studies showed evidence of distinct neurodegenerative disease outcomes and clinical-pathological correlations in the 'oldest-old' compared to younger cohorts. Therefore, using the National Alzheimer's Coordinating Center data set, we analyzed clinical and neuropathological data from two groups according to ages at death: < 80 years (n = 1008) and >= 80 years (n = 1382). In both age groups, severe brain arteriolosclerosis was associated with worse performances on global cognition tests. Hypertension (but not diabetes) was a brain arteriolosclerosis risk factor in the younger group. In the >= 80 years age at death group, an ABCC9 gene variant (rs704180), previously associated with aging-related hippocampal sclerosis, was also associated with brain arteriolosclerosis. A post-hoc arterial spin labeling neuroimaging experiment indicated that ABCC9 genotype is associated with cerebral blood flow impairment; in a convenience sample from Alzheimer's Disease Neuroimaging Initiative (n = 15, homozygous individuals), non-risk genotype carriers showed higher global cerebral blood flow compared to risk genotype carriers."

According to the news reporters, the research concluded: "We conclude that brain arteriolosclerosis is associated with altered cognitive status and a novel vascular genetic risk factor."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/0271678X15621574. This DOI is a link to an online electronic document that is either free or for purchase.

Studies from University of Kentucky Yield New Information about Arthroplasty (The Location and Severity of Preoperative Subchondral Bone Marrow Lesions Were Not Associated With Inferior Postoperative Outcomes After Medial Unicompartmental Knee ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Arthroplasty have been published. According to news reporting out of Lexington, Kentucky, by NewsRx editors, research stated, "Inferior outcomes for medial unicompartmental knee arthroplasty (UKA) patients with preoperative medial tibial bone marrow lesions (BMLs) were recently reported. The purpose of this study was to compare the location and severity of BML on postoperative outcomes after medial UKA and TKA using a larger sample size and more rigorous magnetic resonance imaging (MRI) evaluation."

Our news journalists obtained a quote from the research from the University of Kentucky, "BML were graded on preoperative MRIs from 174 UKAs performed between 2009 and 2013 using the MRI Osteoarthritis Knee Score criteria. Grading was performed by a single evaluator blinded to the patient's outcome. MRIs from a matched group of 174 TKAs were then evaluated. Preoperative and postoperative Knee Society Knee Scores, Pain Scores, and Function Scores (FSs) were then compared between UKA and TKA patients based on the location and severity of BMLs. Overall medial-side BML severity (sum of tibia, femur, and patellar grades) did not affect Pain Score or FS; however, UKA and TKA patients with more severe BMLs had greater preoperative-to-postoperative gains in Knee Society Knee Scores (P = .05). When evaluating individual regions, UKA patients with more severe medial tibial BML had significantly greater gains in FS than those without BML, whereas the opposite was true for TKA patients (P = .02). Similarly, UKA and TKA patients with patellar lesions had greater gains in FS than those without BML (P = .05). Medial femoral BML did not appear to affect outcomes for either UKA or TKA patients. Medial tibial BMLs were not associated with inferior outcomes."

According to the news editors, the research concluded: "Clinically, these results suggest that BMLs should not be considered a contraindication for medial UKA."

Our news journalists report that additional information may be obtained by

Oncology - Non-Small Cell Lung Cancer

Studies from University of Leicester Describe New Findings in Non-Small Cell Lung Cancer (Mast cell phenotype, TNF alpha expression and degranulation status in non-small cell lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Non-Small Cell Lung Cancer is now available. According to news reporting originating in Leicester, United Kingdom, by NewsRx journalists, research stated, "Mast cell infiltration of tumour islets represents a survival advantage in non-small cell lung cancer (NSCLC). The phenotype and activation status of these mast cells is unknown."

The news reporters obtained a quote from the research from the University of Leicester, "We investigated the mast cell phenotype in terms of protease content (tryptase-only [MCT], tryptase + chymase [MCTC]) and tumour necrosis factor-alpha (TNF alpha) expression, and extent of degranulation, in NSCLC tumour stroma and islets. Surgically resected tumours from 24 patients with extended survival (ES; mean survival 86.5 months) were compared with 25 patients with poor survival (PS; mean survival 8.0 months) by immunohistochemistry. Both MCT and MCTC in tumour islets were higher in ES (20.0 and 5.6 cells/mm(2) respectively) compared to PS patients (0.0 cells/mm(2)) (p < 0.0001). Both phenotypes expressed TNFa in the islets and stroma. In ES 44% of MCT and 37% of MCTC expressed TNFa in the tumour islets. MCT in the ES stroma were more degranulated than in those with PS (median degranulation index = 2.24 versus 1.73 respectively) (p = 0.0022), and ES islet mast cells (2.24 compared to 1.71, p< 0.0001). Since both MCT and MCTC infiltrating tumour islets in ES NSCLC patients express TNFa, the cytotoxic activity of this cytokine may confer improved survival in these patients."

According to the news reporters, the research concluded: "Manipulating mast cell microlocalisation and functional responses in NSCLC may offer a novel approach to the treatment of this disease."

Our news correspondents report that additional information may be obtained by
contacting P. Bradding, University of Leicester, Dept. of Infect Immun & Inflammat, Inst Lung Hlth, Leicester, Leics, United Kingdom. Additional authors for this research include C.M. Ohri, R.H. Green, D.A. Waller and P. Bradding.

Cardiovascular Diseases and Conditions - …

Studies from University of Leipzig Have Provided New Information about Hypertension (Osmotic expression of aldose reductase in retinal pigment epithelial cells: involvement of NFAT5)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Hypertension. According to news reporting originating from Leipzig, Germany, by NewsRx correspondents, research stated, "(AR) and sorbitol dehydrogenase (SDH) genes were examined. Diabetic retinopathy is associated with osmotic stress resulting from hyperglycemia and intracellular sorbitol accumulation. Systemic hypertension is a risk factor of diabetic retinopathy."

Funders for this research include Geschwister Freter Stiftung, Hannover, Germany, Deutsche Forschungsgemeinschaft.

Our news editors obtained a quote from the research from the University of Leipzig, "High intake of dietary salt increases extracellular osmolarity resulting in systemic hypertension. We determined the effects of extracellular hyperosmolarity, chemical hypoxia, and oxidative stress on the gene expression of enzymes involved in sorbitol production and conversion in cultured human retinal pigment epithelial (RPE) cells. Alterations in the expression of aldose reductase with real-time RT-PCR. Protein levels were determined with Western blot analysis. Nuclear factor of activated T cell 5 (NFAT5) was knocked down with siRNA. AR gene expression in RPE cells was increased by high (25 mM) extracellular glucose, CoCl2 (150 μM)-induced chemical hypoxia, H2O2 (20 μM)-induced oxidative stress, and extracellular hyperosmolarity induced by addition of NaCl or sucrose. Extracellular hyperosmolarity (but not hypoxia) also increased AR protein level. SDH gene expression was increased by hypoxia and oxidative stress, but not extracellular hyperosmolarity. Hyperosmolarity and hypoxia did not alter the SDH protein level. The hyperosmotic AR gene expression was dependent on activation of metalloproteinases, autocrine/paracrine TGF-beta signaling, activation of p38 MAPK, ERK1/2, and PI3K signal transduction pathways, and the transcriptional activity of NFAT5. Knockdown of NAFT5 or inhibition of AR decreased the cell viability under hyperosmotic (but not hypoxic) conditions and aggravated the hyperosmotic inhibition of cell proliferation. The data suggest that sorbitol accumulation in RPE cells occurs under hyperosmotic, but not hypoxic and oxidative stress conditions."

According to the news editors, the research concluded: "NFAT5- and AR-mediated sorbitol accumulation may protect RPE cells under conditions of osmotic stress."

For more information on this research see: Osmotic expression of aldose reductase in retinal pigment epithelial cells: involvement of NFAT5. Graefes Archive for Clinical and
Studies from University of Leon Reveal New Findings on Photodynamics (Penetration of 630 nm laser and 5-aminolevulinic acid in tissue with intralesional photodynamic therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Photodynamics. According to news originating from Leon, Spain, by NewsRx correspondents, research stated, "Photodynamic therapy is a common treatment in dermatology for several diseases, its main limitation is the penetration of topical photosensitizer and light in the tissue."

Our news journalists obtained a quote from the research from the University of Leon, "However intralesional photodynamic therapy is a new technique where the photosensitizer and sometimes a 630 nm laser beam are applied inside the lesion, so it allows achieve deeper penetration."

According to the news editors, the research concluded: "It has been used to treat basal cell carcinoma, hidradenitis suppurativa or keloids."

For more information on this research see: Penetration of 630 nm laser and 5-aminolevulinic acid in tissue with intralesional photodynamic therapy. Photodiagnosis and Photodynamic Therapy, 2016;16():166-168. Photodiagnosis and Photodynamic Therapy can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Studies from University of Liege Further Understanding of Gardnerella vaginalis (Lysozyme as a cotreatment during antibiotics use against vaginal infections: An in vitro study on Gardnerella vaginalis biofilm models)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Bacterial Diseases and Conditions - Gardnerella vaginalis. According to news reporting originating in Liege, Belgium, by NewsRx journalists, research stated, "Bacterial vaginoses are frequent in women, most of them involving Gardnerella vaginalis. In more than 50% of the cases, usual antibiotic treatments are not capable of eliminating completely the infection, leading to recurrent vaginosis."

The news reporters obtained a quote from the research from the University of Liege, "In addition to the appearance of antibiotic resistance, recurrence can be due to the development of a biofilm by G. vaginalis. In vitro experiments on G. vaginalis biofilms showed that the biofilm protected bacteria from the antibiotic clindamycin. Also, recombinant human lysozyme (rhLys) was able to both degrade biofilms and prevent their formation. This degradation effect persisted whenever other vaginal commensal or pathogenic microorganisms were added to the culture and on each tested clinical biofilm-producing strain of G. vaginalis. The co-administration of rhLys and clindamycin or metronidazole improved both antibiotics' efficiency and lysozyme-driven biofilm degradation. The comparison of both clindamycin and metronidazole antibacterial spectra showed that metronidazole was preferable to treat vaginosis."

According to the news reporters, the research concluded: "This suggests that human lysozyme could be added as an anti-biofilm cotreatment to vaginal antibiotherapy, preferably metronidazole, against Gardnerella vaginalis infection in vivo."

For more information on this research see: Lysozyme as a cotreatment during antibiotics use against vaginal infections: An in vitro study on Gardnerella vaginalis biofilm models. *International Microbiology*, 2016;19(2):101-107. *International Microbiology* can be contacted at: Inst Estudis Catalans, Carrer Del Carme, 47, Barcelona, 08001, Spain. (Springer - www.springer.com; International Microbiology - www.springerlink.com/content/1139-6709/)

Our news correspondents report that additional information may be obtained by contacting O. Thellin, University of Liege, Dept. of Human Histol CRPP, Liege, Belgium. Additional authors for this research include W. Zorzi, D. Zorzi, P. Delvenne, E. Heinen, B. ElMoualij and P. Quatresooz.

Studies from University of Liege Have Provided New Information about Pharmacology (Action of Pitolisant on the stimulant and rewarding effects of cocaine in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Pharmacology is the subject of a report. According to news reporting originating from Liege, Belgium, by NewsRx correspondents, research stated, "Previous studies have demonstrated that the histamine H3 receptor inverse agonist thioperamide potentiates the stimulant and rewarding effects of cocaine. However, these potentiating effects of thioperamide do not necessarily result from H3 receptor blockade since thioperamide is an imidazole-based compound capable of enhancing plasma cocaine concentrations by blocking cytochrome P450 activity."

Funders for this research include Fonds Speciaux pour la Recherche (FSR) at the University of Liege, Belgian National Fund for Scientific Research.

Our news editors obtained a quote from the research from the University of Liege, "In contrast, Pitolisant is a non-imidazole H3 receptor inverse agonist that has already been tested in clinical trials but it remains to be determined whether this compound also potentiates the behavioral effects of cocaine. The present study tested the effects of Pitolisant on locomotion, on cocaine-induced hyperactivity and on the development of conditioned place preference induced by cocaine (2 and 8mg/kg, i.p.) in male C57BL/6J mice. Pitolisant was injected 30min before each cocaine-pairing session. Locomotion recorded on the first cocaine-pairing session was used to test the effects of Pitolisant on the locomotor effects of cocaine. Our results show that doses of Pitolisant higher than 10mg/kg depressed locomotion. When injected alone at doses that did not affect locomotion, Pitolisant (2.5-10mg/kg, i.p.) had no rewarding properties in the place conditioning technique. Additionally, Pitolisant did not significantly alter cocaine-induced hyperactivity and cocaine-induced conditioned place preference. Taken together, our study indicates that Pitolisant has no addictive properties alone. Moreover, this compound does not significantly affect the stimulant and rewarding effects of cocaine."

According to the news editors, the research concluded: "These results add further evidence to support the hypothesis that a pharmacokinetic interaction is involved in the ability of thioperamide to potentiate cocaine's psychomotor effects."

For more information on this research see: Action of Pitolisant on the stimulant and rewarding effects of cocaine in mice. European Journal of Pharmacology, 2016;791():552-559. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www elsevier.com; European Journal of Pharmacology - www.journals.elsevier.com/european-journal-of-pharmacology/)

Oncology - Non-Small Cell Lung Cancer

Studies from University of Lille Add New Findings in the Area of Non-Small Cell Lung Cancer (High-MET status in non-small cell lung tumors correlates with receptor phosphorylation but not with the serum level of soluble form)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Non-Small Cell Lung Cancer have been presented. According to news reporting originating in Lille, France, by NewsRx journalists, research stated, "The receptor tyrosine kinase MET is essential to embryonic development and organ regeneration. Its deregulation is associated with tumorigenesis."

Financial supporters for this research include Ligue Contre le Cancer, Comite Nord, Association pour la Recherche sur le Cancer, Institut National du Cancer, Canceropole Nord-Ouest, Site de Recherche Integree sur le Cancer, SIRIC ONCO, Roche company.

The news reporters obtained a quote from the research from the University of Lille, "While MET gene amplification and mutations leading to MET self-activation concern only a few patients, a high MET level has been found in about half of the non-small cell lung cancers (NSCLCs) tested. How this affects MET activation in tumors is unclear. Also uncertain is the prognostic value, in cancer, of a phenomenon well described in cell models: MET shedding, i.e. its cleavage by membrane proteases leading to release of a soluble fragment into the medium. A prospective cohort of 39 NSCLC patients was constituted at diagnosis or soon after. Normal tissues, tumor tissues, and blood samples were obtained. This allowed, for the same patient, synchronous determination of (i) the MET level in the tumor, (ii) receptor phosphorylation, and (iii) the concentration of soluble MET fragment (sMET) in the serum. After confirming the adequacy of an ELISA for measuring the serum level of sMET, we found no correlation between this level and the concentration of MET in tumors, as evaluated by immunohistochemistry and western blotting. Nevertheless, all but one tumor displaying a high MET level also displayed receptor phosphorylation, restricted to a small number of tumor cells. Our results thus demonstrate that the serum level of sMET is not indicative of the amount of MET present in the tumor cells and cannot be used as a biomarker for therapeutic purposes."

According to the news reporters, the research concluded: "However, MET scoring of tumor biopsies could be a first step prior to determination of MET receptor activation in high-MET tumors."

Our news correspondents report that additional information may be obtained by contacting D. Tulasne, University of Lille, CNRS, Inst Pasteur Lille, UMR 8161M3T, F-59000 Lille, France. Additional authors for this research include M. Lesaffre, M. Berbon, L. Doublet, C. Leroy, E. Tresch, H. Porte, J. Vicogne, A.B. Crotot, E. Dansin and D. Tulasne.

Studies from University of Lisbon Further Understanding of DNA Research (Genetic variants involved in oxidative stress, base excision repair, DNA methylation, and folate metabolism pathways influence myeloid neoplasias susceptibility and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on DNA Research have been published. According to news reporting out of Lisbon, Portugal, by NewsRx editors, research stated, "Myelodysplastic syndrome (MDS) and acute myeloid leukemia (AML) share common features: elevated oxidative stress, DNA repair deficiency, and aberrant DNA methylation. We performed a hospital-based case-control study to evaluate the association in variants of genes involved in oxidative stress, folate metabolism, DNA repair, and DNA methylation with susceptibility and prognosis of these malignancies."

Our news journalists obtained a quote from the research from the University of Lisbon, "To that end, 16 SNPs (one per gene: CAT, CYBA, DNMT1, DNMT3A, DNMT3B, GPX1, KEAP1, MPO, MTRR, NEIL1, NFE2F2, OGG1, SLC19A1, SOD1, SOD2, and XRCC1) were genotyped in 191 patients (101 MDS and 90 AML) and 261 controls. We also measured oxidative stress (reactive oxygen species/total antioxidant status ratio), DNA damage (8-hydroxy-2-deoxyguanosine), and DNA methylation (5-methylcytosine) in 50 subjects (40 MDS and 10 controls). Results showed that five genes (GPX1, NEIL1, NFE2L2, OGG1, and SOD2) were associated with MDS, two (DNMT3B and SLC19A1) with AML, and two (CYBA and DNMT1) with both diseases. We observed a correlation of CYBA TT, GPX1 TT, and SOD2 CC genotypes with increased oxidative stress levels, as well as NEIL1 TT and OGG1 GG genotypes with higher DNA damage. The 5-methylcytosine levels were negatively associated with DNMT1 CC, DNMT3A CC, and MTRR AA genotypes, and positively with DNMT3B CC genotype. Furthermore, DNMT3A, MTRR, NEIL1, and OGG1 variants modulated AML transformation in MDS patients. Additionally, DNMT3A, OGG1, GPX1, and KEAP1 variants influenced survival of MDS and AML patients."

According to the news editors, the research concluded: "Altogether, data suggest that genetic variability influence predisposition and prognosis of MDS and AML patients, as well AML transformation rate in MDS patients."

Oncology - Pancreatic Cancer

Studies from University of Liverpool Describe New Findings in Pancreatic Cancer (Chemoresistance in Pancreatic Cancer Is Driven by Stroma-Derived Insulin-Like Growth Factors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Pancreatic Cancer is now available. According to news reporting originating from Liverpool, United Kingdom, by NewsRx correspondents, research stated, "Tumor-associated macrophages (TAM) and myofibroblasts are key drivers in cancer that are associated with drug resistance in many cancers, including pancreatic ductal adenocarcinoma (PDAC). However, our understanding of the molecular mechanisms by which TAM and fibroblasts contribute to chemoresistance is unclear."

Our news editors obtained a quote from the research from the University of Liverpool, "In this study, we found that TAM and myofibroblasts directly support chemoresistance of pancreatic cancer cells by secreting insulin-like growth factors (IGF) 1 and 2, which activate insulin/IGF receptors on pancreatic cancer cells. Immunohistochemical analysis of biopsies from patients with pancreatic cancer revealed that 72% of the patients expressed activated insulin/IGF receptors on tumor cells, and this positively correlates with increased CD163(+) TAM infiltration. In vivo, we found that TAM and myofibroblasts were the main sources of IGF production, and pharmacologic blockade of IGF sensitized pancreatic tumors to gemcitabine."

According to the news editors, the research concluded: "These findings suggest that inhibition of IGF in combination with chemotherapy could benefit patients with PDAC, and that insulin/IGF1R activation may be used as a biomarker to identify patients for such therapeutic intervention."

For more information on this research see: Chemoresistance in Pancreatic Cancer Is Driven by Stroma-Derived Insulin-Like Growth Factors. Cancer Research, 2016;76(23):6851-6863. Central Nervous System Diseases and Conditions -…

Studies from University of Liverpool Have Provided New Data on Epilepsy (Lamotrigine versus carbamazepine monotherapy for epilepsy: an individual participant data review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Central Nervous System Diseases and Conditions - Epilepsy. According to news reporting from Liverpool, United Kingdom, by NewsRx journalists, research stated, "This is an updated version of the original Cochrane review published in Issue 1, 2006 of the Cochrane Database of Systematic Reviews. Epilepsy is a common neurological condition in which abnormal electrical discharges from the brain cause recurrent unprovoked seizures."

The news correspondents obtained a quote from the research from the University of Liverpool, "It is believed that with effective drug treatment up to 70% of individuals with active epilepsy have the potential to become seizure-free and to go into long-term remission shortly after starting drug therapy with a single antiepileptic drug (AED) in monotherapy. The correct choice of first-line antiepileptic therapy for individuals with newly diagnosed seizures is of great importance. It is important that the choice of AEDs for an individual is made using the highest quality evidence regarding the potential benefits and harms of the various treatments. It is also important that the effectiveness and tolerability of AEDs appropriate to given seizure types are compared to one another. Carbamazepine or lamotrigine are first-line recommended treatments for new onset partial seizures and as a first-or second-line treatment for generalised tonic-clonic seizures. Performing a synthesis of the evidence from existing trials will increase the precision of the results for outcomes relating to efficacy and tolerability and may assist in informing a choice between the two drugs. To review the time to withdrawal, remission and first seizure with lamotrigine compared to carbamazepine when used as monotherapy in people with partial onset seizures (simple or complex partial and secondarily generalised) or generalised onset tonic-clonic seizures (with or without other generalised seizure types). Search methods The first searches for this review were run in 1997. For the most recent update we searched the Cochrane Epilepsy Group Specialized Register (17 October 2016), the Cochrane Central Register of Controlled Trials (CENTRAL) via the Cochrane Register of Studies Online (CRSO, 17 October 2016) and MEDLINE (Ovid, 1946 to 17 October 2016). We imposed no language restrictions. We also contacted pharmaceutical companies and trial investigators. Selection criteria Randomised controlled trials in children or adults with partial onset seizures or generalised onset tonic-clonic seizures comparing monotherapy with either carbamazepine or lamotrigine. Data collection and analysis This was an individual participant data (IPD) review. Our primary outcome was time to withdrawal of allocated treatment and our secondary outcomes were time to first seizure post-randomisation, time to six-month, 12-month and 24-month remission, and incidence of adverse events. We used Cox proportional hazards regression models to obtain trial-specific estimates of hazard ratios (HRs) with 95% confidence intervals (CIs), using the
generic inverse variance method to obtain the overall pooled HR and 95% CI. We included 13 studies in this review. Individual participant data were available for 2572 participants out of 3394 eligible individuals from nine out of 13 trials: 78% of the potential data. For remission outcomes, a HR <1 indicated an advantage for carbamazepine and for first seizure and withdrawal outcomes a HR <1 indicated an advantage for lamotrigine. The main overall results (pooled HR adjusted for seizure type) were: time to withdrawal of allocated treatment (HR 0.72, 95% CI 0.63 to 0.82), time to first seizure (HR 1.22, 95% CI 1.09 to 1.37) and time to six-month remission (HR 0.84, 95% CI 0.74 to 0.94), showing a significant advantage for lamotrigine compared to carbamazepine for withdrawal but a significant advantage for carbamazepine compared to lamotrigine for first seizure and six-month remission. We found no difference between the drugs for time to 12-month remission (HR 0.91, 95% CI 0.77 to 1.07) or time to 24-month remission (HR 1.00, 95% CI 0.80 to 1.25), however only two trials followed up participants for more than one year so the evidence is limited. The results of this review are applicable mainly to individuals with partial onset seizures; 88% of included individuals experienced seizures of this type at baseline. Up to 50% of the limited number of individuals classified as experiencing generalised onset seizures at baseline may have had their seizure type misclassified, therefore we recommend caution when interpreting the results of this review for individuals with generalised onset seizures. The most commonly reported adverse events for both of the drugs across all of the included trials were dizziness, fatigue, gastrointestinal disturbances, headache and skin problems. The rate of adverse events was similar across the two drugs. The methodological quality of the included trials was generally good, however there is some evidence that the design choice of masked or open-label treatment may have influenced the withdrawal rates of the trials. Hence, we judged the quality of the evidence for the primary outcome of treatment withdrawal to be moderate for individuals with partial onset seizures and low for individuals with generalised onset seizures. For efficacy outcomes (first seizure, remission), we judged the quality of evidence to be high for individuals with partial onset seizures and moderate for individuals with generalised onset seizures. Authors' conclusions Lamotrigine was significantly less likely to be withdrawn than carbamazepine but the results for time to first seizure suggested that carbamazepine may be superior in terms of seizure control. A choice between these first-line treatments must be made with careful consideration."

According to the news reporters, the research concluded: "We recommend that future trials should be designed to the highest quality possible with consideration of masking, choice of population, classification of seizure type, duration of follow-up, choice of outcomes and analysis, and presentation of results."

For more information on this research see: Lamotrigine versus carbamazepine monotherapy for epilepsy: an individual participant data review. Cochrane Database of Systematic Reviews, 2016;(11):4-100. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Studies from University of Malaya Yield New Data on Type 2 Diabetes

[Giant Oyster Mushroom Pleurotus giganteus (Agaricomycetes)
Enhances Adipocyte Differentiation and Glucose Uptake via Activation
of PPARy and Glucose Transporters 1 and 4 in ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been published. According to news reporting from Kuala Lumpur, Malaysia, by NewsRx journalists, research stated, "The edible mushroom Pleurotus giganteus was tested for its effect on adipocyte differentiation and glucose uptake activity in 3T3-L1 cells. The basidiocarps of P. giganteus were soaked in methanol to obtain a crude methanol extract and then fractionated to obtain an ethyl acetate extract."

The news correspondents obtained a quote from the research from the University of Malaya, "In this study, cell proliferation was measured using an MTT assay, lipid accumulation using an Oil Red 0 assay, and glucose uptake using a fluorescence glucose uptake assay. Gene expression was measured via real-time polymerase chain reaction analysis with TagMan primer. Ethyl acetate extract significantly enhanced adipogenic differentiation and glucose uptake in 3T3-L1 adipocytes via the expression of sterol regulatory element-binding protein, peroxisome proliferator-activated receptor gamma, and phosphatidylinositol 3-kinase/Akt. Glucose uptake was facilitated by the highly expressed glucose transporters Glut1 and Glut4."

According to the news reporters, the research concluded: "Taken together, these results suggest that P. giganteus ethyl acetate extract has an insulin-sensitizing effect on adipocytes and has potential as an adjuvant for the management of type 2 diabetes."

For more information on this research see: Giant Oyster Mushroom Pleurotus giganteus (Agaricomycetes) Enhances Adipocyte Differentiation and Glucose Uptake via Activation of PPARy and Glucose Transporters 1 and 4 in 3T3-L1 Cells. International Journal of Medicinal Mushrooms, 2016;18(9):821-831. International Journal of Medicinal Mushrooms can be contacted at: Begell House Inc, 50 North St, Danbury, CT 06810, USA.

Gram-Negative Bacteria - Pseudomonas putida

Studies from University of Manchester Provide New Data on Pseudomonas putida [Metabolomics reveals the physiological response of Pseudomonas putida KT2440 (UWC1) after pharmaceutical exposure]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Pseudomonas putida have been published. According to news reporting out of Manchester, United Kingdom, by NewsRx editors, research stated, "Human pharmaceuticals have been detected in wastewater treatment plants, rivers, and estuaries throughout Europe and the United States. It is widely acknowledged that there is insufficient information available to determine whether prolonged exposure to low levels of these substances is having an impact on the microbial ecology in such environments."

Our news journalists obtained a quote from the research from the University of Manchester, "In this study we attempt to measure the effects of exposing cultures of Pseudomonas putida KT2440 (UWC1) to six pharmaceuticals by looking at differences in metabolite levels. Initially, we used Fourier transform infrared (FT-IR) spectroscopy coupled with multivariate analysis to discriminate between cell cultures exposed to different pharmaceuticals. This suggested that on exposure to propranolol there were significant changes in the lipid complement of P. putida. Metabolic profiling with gas chromatography-mass spectrometry (GC-MS), coupled with univariate statistical analyses, was used to identify endogenous metabolites contributing to discrimination between cells exposed to the six drugs. This approach suggested that the energy reserves of exposed cells were being expended and was particularly evident on exposure to propranolol. Adenosine triphosphate (ATP) concentrations were raised in P. putida exposed to propranolol."

According to the news editors, the research concluded: "Increased energy requirements may be due to energy dependent efflux pumps being used to remove propranolol from the cell."

Our news journalists report that additional information may be obtained by contacting F. Currie, School of Chemistry, Manchester Institute of Biotechnology, University of Manchester, 131 Princess Street, Manchester, M1 7ND, UK. Additional authors for this research include D.I. Broadhurst, W.B. Dunn, C.A. Sellick and R. Goodacre.

Studies from University of Maryland Further Understanding of Aortic Coarctation (Retrospective case series examining the clinical significance of subjective fetal cardiac ventricular disproportion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Aortic Coarctation are discussed in a new report. According to news reporting originating in Baltimore, Maryland, by NewsRx journalists, research stated, "To evaluate fetal cardiac ventricular disproportion as a marker of cardiac anomalies. A retrospective case series included data from all patients who had a fetus diagnosed subjectively with ventricular disproportion by routine obstetric ultrasonography between January 1, 2007 and December 31, 2013 at a single tertiary center in the USA."

The news reporters obtained a quote from the research from the University of Maryland, "Fetal and neonatal echocardiography, and neonatal outcome data were retrieved. Outcomes were described for all fetuses with subjective ventricular disproportion. Then, the objective right-to-left ventricular ratio (RLVR) was calculated as a continuous (after transformation to gestational age specific z-scores) or categorical value (>2SD for gestational week), based on previously published reference values. Subsequently, correlations between the objective RLVR and neonatal outcomes were evaluated. Records from 60 fetuses diagnosed with ventricular disproportion at 16-38 weeks of gestation were included. These pregnancies resulted in 54 live deliveries; postnatally, 20 (37%) of these neonates were diagnosed with aortic coarctation and 39 (72%) were diagnosed with other cardiac anomalies, with or without aortic coarctation. No significant differences in objective prenatal diagnostic findings (RLVR) were demonstrated between neonates who were diagnosed postnatally with aortic coarctation or any cardiac anomaly and those not. Subjective ventricular disproportion, regardless of objective diagnosis, was associated with cardiac defects."

According to the news reporters, the research concluded: "The use of fetal and neonatal echocardiography following diagnosis of fetal ventricular disproportion appears justified."

Our news correspondents report that additional information may be obtained by contacting S. Turan, University of Maryland, Sch Med, Dept. of Obstet Gynecol & Reprod Sci, Baltimore, MD 21201, United States. Additional authors for this research include B.C. Demir, S. Crimmins, S. Esin, O.M. Turan and S. Turan.

Heart Disorders and Diseases - Heart Attack

Studies from University of Maryland Have Provided New Information about Heart Attack (Outcomes of extracorporeal cardiopulmonary resuscitation for refractory cardiac arrest in adult cardiac surgery patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Attack have been published. According to news originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "The role of extracorporeal cardiopulmonary resuscitation (ECPR) in adult cardiac surgery patients with refractory cardiac arrest is uncertain. We hypothesized that ECPR would be associated with better than expected outcomes in this group of patients."

Our news journalists obtained a quote from the research from the University of Maryland, "We conducted a single-center retrospective cohort study of adult cardiac surgery patients who underwent ECPR for refractory cardiac arrest during a 6-year period (2010 to 2015). In-hospital mortality, survival at last follow-up, and cerebral performance category (CPC) were examined as outcomes, and potential risk factors for mortality were explored. Twenty-three patients underwent ECPR when spontaneous circulation did not return with conventional resuscitation. Thirty-day mortality was 65.2%, and in-hospital mortality was 69.6%. Six of the 23 patients (26.1%) were discharged with a favorable neurologic outcome, defined as CPC 1 or 2. Most patients who died had multiple organ dysfunction syndrome (43.8%), and a smaller number had severe brain injury (25.0%). Kaplan-Meier survival analysis suggested age as a critical factor affecting survival (P = .04, log-rank test). ECPR may have a role in younger adult cardiac surgery patients who experience refractory cardiac arrest."

According to the news editors, the research concluded: "Future studies are needed to identify patients who will benefit most from ECPR."

The news correspondents report that additional information may be obtained from M.A. Mazzeffi, University of Maryland, Sch Med, Dept. of Shock Trauma Crit Care, Baltimore, MD 21201, United States. Additional authors for this research include P.G. Sanchez, D. Herr, E. Krause, C.F. Evans, R. Rector, B. McCormick, S. Pham, B. Taylor, B. Griffith and Z.N. Kon.

Studies from University of Maryland in the Area of Amyotrophic Lateral Sclerosis Reported (Motor neuron disease, TDP-43 pathology, and memory deficits in mice expressing ALS-FTD-linked UBQLN2 mutations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Neurodegenerative Diseases and Conditions - Amyotrophic Lateral Sclerosis are discussed in a new report. According to news reporting out of Baltimore, Maryland, by NewsRx editors, research stated, "Missense mutations in ubiquilin 2 (UBQLN2) cause ALS with frontotemporal dementia (ALS-FTD). Animal models of ALS are useful for understanding the mechanisms of pathogenesis and for preclinical investigations."

Our news journalists obtained a quote from the research from the University of Maryland, "However, previous rodent models carrying UBQLN2 mutations failed to manifest any sign of motor neuron disease. Here, we show that lines of mice expressing either the ALS-FTD-linked P497S or P506T UBQLN2 mutations have cognitive deficits, shortened lifespans, and develop motor neuron disease, mimicking the human disease. Neuropathologic analysis of the mice with end-stage disease revealed the accumulation of ubiquitinated inclusions in the brain and spinal cord, astrogliosis, a reduction in the number of hippocampal neurons, and reduced staining of TAR-DNA binding protein 43 in the nucleus, with concomitant formation of ubiquitin(+) inclusions in the cytoplasm of spinal motor neurons. Moreover, both lines displayed denervation muscle atrophy and age-dependent loss of motor neurons that correlated with a reduction in the number of large-caliber axons. By contrast, two mouse lines expressing WT UBQLN2 were mostly devoid of clinical and pathological signs of disease."

According to the news editors, the research concluded: "These UBQLN2 mouse models provide valuable tools for identifying the mechanisms underlying ALS-FTD pathogenesis and for investigating therapeutic strategies to halt disease."

Our news journalists report that additional information may be obtained by contacting M.J. Monteiro, University of Maryland, Sch Med, Dept. of Anat & Neurobiol, Baltimore, MD 21201, United States. Additional authors for this research include L. Chang, I.

Keywords for this news article include: Baltimore, Maryland, United States, North and Central America, Neurodegenerative Diseases and Conditions, Nervous System Diseases and Conditions, Neuromuscular Diseases and Conditions, Amyotrophic Lateral Sclerosis, Motor Neuron Disease, Pathology, Neurology, Genetics, University of Maryland.

Oncology - B-Cell Lymphoma

Studies from University of Maryland in the Area of B-Cell Lymphoma Reported (Expression of HIV-1 matrix protein p17 and association with B-cell lymphoma in HIV-1 transgenic mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - B-Cell Lymphoma. According to news reporting from Baltimore, Maryland, by NewsRx journalists, research stated, "HIV-1 infection is associated with increased risk for B-cell lymphomas. How HIV infection promotes the development of lymphoma is unclear, but it may involve chronic B-cell activation, inflammation, and/or impaired immunity, possibly leading to a loss of control of oncogenic viruses and reduced tumor immunosurveillance."

Funders for this research include HHS | NIH | National Cancer Institute (NCI), HHS | National Institutes of Health (NIH).

The news correspondents obtained a quote from the research from the University of Maryland, "We hypothesized that HIV structural proteins may contribute to lymphomagenesis directly, because they can persist long term in lymph nodes in the absence of viral replication. The HIV-1 transgenic mouse Tg26 carries a noninfectious HIV-1 provirus lacking part of the gag-pol region, thus constituting a model for studying the effects of viral products in pathogenesis. Approximately 15% of Tg26 mice spontaneously develop leukemia/lymphoma. We investigated which viral proteins are associated with the development of leukemia/lymphoma in the Tg26 mouse model, and performed microarray analysis on RNA from spleen and lymph nodes to identify potential mechanisms of lymphomagenesis. Of the viral proteins examined, only expression of HIV-1 matrix protein p17 was associated with leukemia/lymphoma development and was highly expressed in bone marrow before disease. The tumor cells resembled pro-B cells, and were CD19(+) IgM(-) IgD(-) CD93(+) CD43(-) CD21(-) CD23(-) VpreB(+) CXCR4(+). Consistent with the pro-B-cell stage of B-cell development, microarray analysis revealed enrichment of transcripts, including Rag1, Rag2, CD93, Vpreb1, Vpreb3, and Igll1. We confirmed RAG1 expression in Tg26 tumors, and hypothesized that HIV-1 matrix protein p17 may directly induce RAG1 in B cells."

According to the news reporters, the research concluded: "Stimulation of human activated B cells with p17 enhanced RAG1 expression in three of seven donors, suggesting that intracellular signaling by p17 may lead to genomic instability and transformation."

For more information on this research see: Expression of HIV-1 matrix protein p17 and association with B-cell lymphoma in HIV-1 transgenic mice. Proceedings of the National Academy of Sciences of the United States of America, 2016;113(46):13168-13173.
Studies from University of Massachusetts Further Understanding of Diarylheptanoids (Effects of Stable Degradation Products of Curcumin on Cancer Cell Proliferation and Inflammation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Diarylheptanoids. According to news originating from Amherst, Massachusetts, by NewsRx correspondents, research stated, "Curcumin is among the most promising dietary compounds for cancer prevention. However, curcumin rapidly degrades in aqueous buffer at physiological pH, making it difficult to understand whether the effects of curcumin are from curcumin itself or its degradation products."

Financial supporters for this research include National Institute of Food and Agriculture, Armstrong Fund for Science, University of Massachusetts Amherst.

Our news journalists obtained a quote from the research from the University of Massachusetts, "Here we studied the antiproliferative and anti-inflammatory effects of curcumin degradation products, including its total degradation products (a mixture containing all stable degradation products of curcumin) and bicyclopentadione (a dominant stable degradation compound of curcumin). Curcumin potently modulated cell proliferation, progression of cell cycle, and apoptosis in MC38 colon cancer cells and inhibited lipopolysaccharide (LPS)-induced inflammatory responses and NF-kappa B signaling in RAW 264.7 macrophage cells. In contrast, neither the total degradation products of curcumin nor bicyclopentadione had such effects. For example, after 24 h of treatment in MC38 colon cancer cells, 5 µg/mL curcumin inhibited 39.2 +/- 1.8% of cell proliferation, whereas its degradation products were inactive."

According to the news editors, the research concluded: "Together, these results suggest that the stable chemical degradation products of curcumin are not likely to play a major
role in mediating the biological activities of curcumin."

The news correspondents report that additional information may be obtained from G.D. Zhang, University of Massachusetts, Dept. of Food Sci, Amherst, MA 01003, United States. Additional authors for this research include J.L. Zhu, W.C. Wang, Z.Y. Du and G.D. Zhang.

**Studies from University of Massachusetts Yield New Information about Oncology Nursing (Pain and social processes for hospice cancer patients: An integrative review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nursing - Oncology Nursing. According to news reporting originating from Amherst, Massachusetts, by NewsRx correspondents, research stated, "Hospice cancer patients experience poorly-controlled pain in spite of widely-disseminated evidence-based guidelines for use by hospice care practitioners. Pain management occurs in the context of the interdisciplinary team, centered on a caring triad in the home: the person with pain, their caregiver, and their nurse."

Financial support for this research came from Oncology Nursing Foundation.

Our news editors obtained a quote from the research from the University of Massachusetts, "This review: 1) Summarizes what is known about differing ways that members of the hospice caring triad (patients, caregivers, and nurses) interpret and respond to cancer pain, in order to develop a cancer pain social processes theoretical framework, 2) Identifies gaps in understanding of hospice cancer pain social processes, and 3) Identifies framework concepts for research based clinical practice with potential to improve pain outcomes. Our integrative review of the literature resulted in the identification and synthesis of 21 unique studies of cancer pain social processes, which were categorized according to a social processes framework and hospice caring triad member roles, using a social processes concepts matrix. Pain meanings, goals, and related responses vary for persons with pain, caregivers, and nurses. Studies have explored individual social processes concepts or triad member roles. Studies identify the need for pain meaning to be included in hospice pain management plans. To our knowledge, no single study
has generated a framework for hospice cancer pain social processes addressing and incorporating the roles of all three caring triad members."

According to the news editors, the research concluded: "Therefore, comprehensive hospice cancer pain clinical evaluation and interventions plans may be missing key elements of pain management, especially for persons with ongoing poorly controlled pain."

The news editors report that additional information may be obtained by contacting O. Ehrlich, University of Massachusetts, Amherst, MA 01003, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ejon.2016.10.001. This DOI is a link to an online electronic document that is either free or for purchase.

Drug Resistance

Studies from University of Massachusetts in the Area of Drug Resistance Described (Molecular Basis for Differential Patterns of Drug Resistance in Influenza N1 and N2 Neuraminidase)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drug Resistance. According to news reporting originating in Worcester, Massachusetts, by NewsRx journalists, research stated, "Neuraminidase (NA) inhibitors are used for the prevention and treatment of influenza A virus infections. Two subtypes of NA, N1 and N2, predominate in viruses that infect humans, but differential patterns of drug resistance have emerged in each subtype despite highly homologous active sites."

Funders for this research include Defense Sciences Office, DARPA, Office of the Assistant Secretary of Defense for Health Affairs.

The news reporters obtained a quote from the research from the University of Massachusetts, "To understand the molecular basis for the selection of these drug resistance mutations, structural and dynamic analyses on complexes of N1 and N2 NA with substrates and inhibitors were performed. Comparison of dynamic substrate and inhibitor envelopes and interactions at the active site revealed how differential patterns of drug resistance have emerged for specific drug resistance mutations, at residues I222, S246, and H274 in N1 and E119 in N2. Our results show that the differences in intermolecular interactions, especially van der Waals contacts, of the inhibitors versus substrates at the NA active site effectively explain the selection of resistance mutations in the two subtypes."

According to the news reporters, the research concluded: "Avoiding such contacts
that render inhibitors vulnerable to resistance by better mimicking the dynamics and intermolecular interactions of substrates can lead to the development of novel inhibitors that avoid drug resistance in both subtypes."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.jctc.6b00703. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Calcium Channel Blocking...**

**Studies from University of Medicine and Dentistry of New Jersey (UMDNJ) in the Area of Calcium Channel Blocking Agents Described (The utility of bolus intravenous nicardipine for hypertensive emergencies in the ED)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Calcium Channel Blocking Agents is now available. According to news originating from New Brunswick, New Jersey, by NewsRx correspondents, research stated, "Nicardipine is a commonly used agent for the management of hypertensive emergencies due to its predictable pharmacokinetic profile and ease of titration. There is documented use of nicardipine administered as an intravenous (IV) bolus dose in several settings, particularly in the anesthesia literature."

Our news journalists obtained a quote from the research from the University of Medicine and Dentistry of New Jersey (UMDNJ), "We describe the first 2 documented cases of use of nicardipine administered as an IV bolus dose in the emergency department (ED) for hypertensive emergencies involving acute ischemic stroke and hemorrhagic stroke. A literature review follows along with recommendations for consideration for IV bolus dosing of nicardipine in the ED."

According to the news editors, the research concluded: "Overall, administration of nicardipine as an IV bolus dose may be effective for rapid short-term management of hypertensive crises in the ED setting."

The news correspondents report that additional information may be obtained from N.I. Awad, Robert Wood Johnson Univ Hosp, Dept. of Pharm, New Brunswick, NJ, United States.

**Heart Disorders and Diseases - Atrial Fibrillation**

**Studies from University of Melbourne in the Area of Atrial Fibrillation Described (Alcohol and Atrial Fibrillation A Sobering Review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting from Parkville, Australia, by NewsRx journalists, research stated, "Alcohol is popular in Western culture, supported by a perception that modest intake is cardioprotective. However, excessive drinking has detrimental implications for cardiovascular disease."

The news correspondents obtained a quote from the research from the University of Melbourne, "Atrial fibrillation (AF) following an alcohol binge or the 'holiday heart syndrome' is well characterized. However, more modest levels of alcohol intake on a regular basis may also increase the risk of AF. The pathophysiological mechanisms responsible for the relationship between alcohol and AF may include direct toxicity and alcohol's contribution to obesity, sleep-disordered breathing, and hypertension."

According to the news reporters, the research concluded: "We aim to provide a comprehensive review of the epidemiology and pathophysiology by which alcohol may be responsible for AF and determine whether alcohol abstinence is required for patients with AF."

For more information on this research see: Alcohol and Atrial Fibrillation A Sobering Review. *Journal of the American College of Cardiology*, 2016;68(23):2567-2576. *Journal of the American College of Cardiology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA.

Our news journalists report that additional information may be obtained by contacting P.M. Kistler, University of Melbourne, Parkville, Vic, Australia. Additional authors for this research include S. Prabhu, L.H. Ling, J.M. Kalman and P.M. Kistler.

Keywords for this news article include: Parkville, Australia, Australia and New Zealand, Atrial Fibrillation, Article Review, Epidemiology, Heart Disorders and Diseases, Cardiac Arrhythmias, Heart Disease, University of Melbourne.
Angiology

Studies from University of Miami Jackson Memorial Hospital Describe New Findings in Angiology (Endovascular Coil Embolization in the Treatment of a Rare Case of Post-Traumatic Abdominal Aortic Pseudoaneurysms: Brief Report and Review of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Angiology is the subject of a report. According to news reporting from Miami, Florida, by NewsRx journalists, research stated, "Traumatic aortic injury, a consequence of penetrating injuries or blunt trauma, is a life threatening condition which requires prompt diagnosis and management. Most abdominal aortic injuries have been repaired via an open surgical approach with endovascular stent graft as an alternative."

The news correspondents obtained a quote from the research from the University of Miami Jackson Memorial Hospital, "Traumatic pseudoaneurysms (PSA) of the abdominal aorta are uncommon, and they are managed similar to other abdominal aortic injuries. However, the presence of a perianeurysmal hematoma and the potential risk of an associated concomitant bowel communication could make surgery and endovascular stent graft placement risky. In such patients, coil embolization could be a valued option. In this article, we present a case in which traumatic PSAs are repaired using coil embolization with technical and clinical success."

According to the news reporters, the research concluded: "Endovascular coil embolization could be an alternative approach for PSAs that cannot be treated by stent grafting or open surgical repair, in the appropriate anatomy and by using the right coil material and technique."

Our news journalists report that additional information may be obtained by contacting K. Pereira, Univ Miami Hosp, Jackson Mem Hosp, Dept. of Intervent Radiol, Miami, FL, United States. Additional authors for this research include K. Pereira, J. Rey and G. Narayanan.

Keywords for this news article include: Miami, Florida, United States, North and Central America, Angiology, Surgery, Embolization, University of Miami Jackson Memorial Hospital.

Liver Diseases and Conditions - Hepatitis C Virus

Studies from University of Miami Yield New Data on Hepatitis C Virus (STAT1 is essential for the inhibition of hepatitis C virus replication by interferon-lambda but not by interferon-alpha)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Hepatitis C Virus have been published. According to news originating from Miami, Florida, by NewsRx correspondents, research stated, "Interferon-alpha (IFN-alpha) and IFN-lambda are structurally distinct cytokines that bind to different receptors, but induce expression of similar sets of genes through Janus kinase (JAK)-signal transducers and activators of transcription (STAT) pathways. The difference between IFN-alpha and IFN-lambda signaling remains poorly understood."

Our news journalists obtained a quote from the research from the University of Miami, "Here, using the CRISPR/Cas9 system, we examine the role of STAT1 and STAT2 in the inhibition of hepatitis C virus (HCV) replication by IFN-alpha and IFN-lambda. Treatment with IFN-alpha increases expression of IFN-stimulated genes (ISGs) such as double-stranded RNA-activated protein kinase (PKR) and decreases viral RNA and protein levels in HCV-infected Huh-7.5 human hepatoma cells. These responses are only partially attenuated by knockout of STAT1 but are abolished by knockout of STAT2. In contrast, the inhibition of HCV replication by IFN-lambda is abolished by knockout of STAT1 or STAT2. Microarray analysis reveals that IFN-alpha but not IFN-lambda can induce expression of the majority of ISGs in STAT1 knockout cells."

According to the news editors, the research concluded: "These findings suggest that IFN-alpha can inhibit HCV replication through a STAT2-dependent but STAT1-independent pathway, whereas IFN-lambda induces."

For more information on this research see: STAT1 is essential for the inhibition of hepatitis C virus replication by interferon-lambda but not by interferon-alpha. Scientific Reports, 2016;6():1-11. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com; Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from S. Yamauchi, University of Miami, Miller Sch Med, Dept. of Cell Biol, Miami, FL 33136, United States. Biotechnology - Genomics

Studies from University of Michigan Have Provided New Information about Genomics (Selection-, age-, and exercise-dependence of skeletal muscle gene expression patterns in a rat model of metabolic fitness)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Biotechnology - Genomics have been published. According to news reporting originating from Ann Arbor, Michigan, by NewsRx correspondents, research stated, "Intrinsic aerobic exercise capacity can influence many complex traits including obesity and aging. To study this connection we established two rat lines by divergent selection of untrained aerobic capacity."

Financial supporters for this research include Ellison Medical Foundation (EMF), HHS | NIH | National Institute of Diabetes and Digestive and Kidney Diseases (NIDDK).

Our news editors obtained a quote from the research from the University of Michigan, "After 32 generations the high capacity runners (HCR) and low capacity runners (LCR) differed in endurance running distance and body fat, blood glucose, other health indicators, and natural life span. To understand the interplay among genetic differences, chronological age, and acute exercise we performed microarray-based gene expression analyses in skeletal muscle with a 2x2x2 design to simultaneously compare HCR and LCR, old and young animals, and rest and exhaustion. Transcripts for mitochondrial function are expressed higher in HCRs than LCRs at both rest and exhaustion and for both age groups. Expression of cell adhesion and extracellular matrix genes tend to decrease with age. This and other age effects are more prominent in LCRs than HCRs, suggesting that HCRs have a slower aging process and this may be partly due to their better metabolic health. Strenuous exercise mainly affects transcription regulation and cellular response. The effects of any one factor often depend on the other two. For example, there are similar to 140 and similar to 110 line-exercise 'interacting' genes for old and young animals, respectively. Many genes highlighted in our study are consistent with prior reports, but many others are novel."

According to the news editors, the research concluded: "The gene-and pathway-level statistics for the main effects, either overall or stratified, and for all possible interactions, represent a rich reference dataset for understanding the interdependence among lines, aging, and exercise."

For more information on this research see: Selection-, age-, and exercise-dependence of skeletal muscle gene expression patterns in a rat model of metabolic fitness. Physiological Genomics, 2016;48(11):816-825. Physiological Genomics can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Acrylates

Studies from University of Michigan Reveal New Findings on Acrylates (Radical-Medicated End-Group Transformation of Amphiphilic Methacrylate Random Copolymers for Modulation of Antimicrobial and Hemolytic Activities)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Acrylates. According to news reporting originating from Ann Arbor, Michigan, by NewsRx correspondents, research stated, "This work describes synthesis of antimicrobial methacrylate copolymers by reversible addition-fragmentation chain transfer (RAFT) polymerization and examines the versatility of this approach for improving chemical optimization to create potent, non-toxic antimicrobial polymers. Specifically, this study focuses on the radical-mediated transformation of end group of antimicrobial peptide-mimetic polymer."

Our news editors obtained a quote from the research from the University of Michigan, "RAFT polymerization using 2-cyano-2-yl-dithiobenzoate provided a statistical methacrylate copolymer consisting of aminobutyl and ethyl groups in the side chains. The following radical-mediated modification using free radical initiators successfully transformed the x-end group of parent copolymer from dithiobenzoate to a cyanoisobutyl or aminoethyl cyanopentanoate group without any significant changes to the polymer molecular weight. In general, the parent polymer and variants showed a broad spectrum of activity against a panel of bacteria, but low hemolytic activity against human red blood cells. The parent copolymer with the dithiobenzoate end-group showed highest antimicrobial and hemolytic activities as compared with other copolymers. The copolymers caused membrane depolarization in Staphylococcus aureus, while the ability of copolymers for membrane disruption is not dependent on the end-group structures."

According to the news editors, the research concluded: "The synthetic route reported in this study will be useful for further study of the role of polymer end-groups in the antimicrobial activity of copolymers."

The news editors report that additional information may be obtained by contacting K. Kuroda, University of Michigan, Sch Dental, Dept. of Biol & Mat Sci, Ann Arbor, MI 48109, United States. Additional authors for this research include H. Takahashi and K. Kuroda.

Studies from University of Michigan Yield New Data on Breast Cancer
(Updates on breast cancer genetics: Clinical implications of detecting syndromes of inherited increased susceptibility to breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting originating in Ann Arbor, Michigan, by NewsRx journalists, research stated, "Since the initial discovery that pathogenic germline alterations in BRCA 1/2 increase susceptibility to breast and ovarian cancer, many additional genes have now been discovered that also increase breast cancer risk. Given that several more genes have now been implicated in hereditary breast cancer syndromes, there is increased clinical use of multigene panel testing to evaluate patients with a suspected genetic predisposition to breast cancer."

The news reporters obtained a quote from the research from the University of Michigan, "While this is most certainly a cost-effective approach, broader testing strategies have resulted in a higher likelihood of identifying moderate-penetrance genes, for which management guidelines regarding breast cancer risk reduction have not been firmly established. In addition, the testing of more genes has led to increased detection of variants of uncertain significance. We review the current knowledge regarding both high- and moderate-risk hereditary breast cancer syndromes, as well as additional genes implicated in hereditary breast cancer for which there is limited data."

According to the news reporters, the research concluded: "Furthermore, strategies for cancer risk reduction in mutation carriers as well as therapeutic implications for those patients who harbor pathogenic germline alterations are discussed."

For more information on this research see: Updates on breast cancer genetics: Clinical implications of detecting syndromes of inherited increased susceptibility to breast cancer. Seminars in Oncology, 2016;43(5):528-535. Seminars in Oncology can be contacted at: W B Saunders Co-Elsevier Inc, 1600 John F Kennedy Boulevard, Ste 1800, Philadelphia, PA 19103-2899, USA. Studies from University of Milan Further Understanding of Stem Cell Research (Does the Bovine Pre-Ovulatory Follicle Harbor Progenitor Stem Cells?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Stem Cell Research are discussed in a new report. According to news reporting originating from Lodi, Italy, by NewsRx correspondents, research stated, "Recent studies have revealed the presence of a mesenchymal stem cell (MSC) population in human and in gilt granulosa cells (GCs), thus increasing the interest in identifying the same population in the bovine species. We first isolated GCs by scraping from bovine preovulatory follicles and then tested several different media to define the ideal conditions to select granulosa-derived stem cells."

Our news editors obtained a quote from the research from the University of Milan, "Although expressing MSC-associated markers, none of the media tested proven to be efficient in selecting MSC-like cells that were able to differentiate into mesodermic or ectodermic lineages. We performed another experimental approach exposing cells to a chemical stress, such as lowering of pH, as a system to select a more plastic population. Following the treatment, granulosa-specific granulose markers [follicle-stimulating hormone receptor (FSHR), follistatin (FST), and leukemia inhibitory factor receptor (LIFR)] were lost in bovine GCs, whereas an increase in multi-(CD29, CD44, CD73) and pluripotent (Oct-4 and c-Myc) genes was noticed. The stress allowed up-regulation of tumor necrosis factor-a and interleukin-1b expression and the dedifferentiation of GCs, which was demonstrated by differentiation studies."

According to the news editors, the research concluded: "Indeed, pH-treated cells were able to differentiate into the mesodermic and ectodermic lineages, thus suggesting that the chemical stress allows for the selection of cells that are more prone to adjust and respond to the environmental changes."

The news editors report that additional information may be obtained by contacting A. Lange-Consiglio, 1 Large Animal Hospital, Reproduction Unit, Universita degli Studi di Milano, Lodi, Italy. Additional authors for this research include A. Romaldini, A. Correani, B. Corradetti, P. Esposti, M.F. Cannata, C. Perrini, M.G. Marini, D. Bizzaro and F. Cremonesi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1089/cell.2015.0062. This DOI is a link to an online electronic document that is either free or for purchase.

Studies from University of Milan Have Provided New Information about Mitotic Inhibitors (Palmitoylethanolamide Reverses Paclitaxel-Induced Allodynia in Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Mitotic Inhibitors have been published. According to news reporting originating from Milan, Italy, by NewsRx correspondents, research stated, "Chemotherapy-induced peripheral neuropathy (CIPN) represents a serious complication associated with antineoplastic drugs. Although there are nomedications available that effectively prevent CIPN, many classes of drugs have been used to treat this condition, including anticonvulsants, serotonin and noradrenaline reuptake inhibitors, and opioids."

Our news editors obtained a quote from the research from the University of Milan, "However, these therapeutic options yielded inconclusive results in CIPN clinical trials and produced assorted side effects with their prolonged use. Thus, there is an urgent need to develop efficacious and safe treatments for CIPN. In this report, we tested whether the endogenous lipid palmitoylethanolamide (PEA) alone or in combination with the anticonvulsant gabapentin would reduce allodynia in a mouse paclitaxel model of CIPN. Gabapentin and PEA reversed paclitaxel-induced allodynia with respective ED50 doses (95% confidence interval) of 67.4 (61.52-73.94) and 9.2 (8.39-10.16) mg/kg. Isobolographic analysis of these drugs in combination revealed synergistic antiallodynic effects. The PPAR-a antagonist receptor antagonist GW6471 [N-(2S)-2-(((1Z)-1-methyl-3-oxo-3-(4-(trifluoromethyl)phenyl)prop-1-enyl)amino)-3-(4-(2-(5-methyl-2-phenyl-1,3-oxazol-4-yl)ethoxy)phenyl)propyl]propanamide] completely blocked the antinociceptive effects of PEA. In addition, PEA administered via intraplantar injection into a paw, intrathecal injection, and intracerebroventricular injection reversed paclitaxel-induced allodynia, suggesting that it may act at multiple sites in the neuroaxis and periphery. Finally, repeated administration of PEA (30 mg/kg, 7 days) preserved the antiallodynic effects with no evidence of tolerance."

According to the news editors, the research concluded: "These findings taken together suggest that PEA possesses potential to treat peripheral neuropathy in cancer patients undergoing chemotherapy."

The news editors report that additional information may be obtained by contacting G. Donvito, Univ Milano Bicocca, Dept. of Biotechnol & Biosci, Milan, Italy. Additional authors for this research include J.L. Wilkerson, M.I. Damaj and A.H. Lichtman.

Keywords for this news article include: Milan, Italy, Europe, Drugs and Therapies, Paclitaxel Therapy, Mitotic Inhibitors, Organic Chemicals, Pharmaceuticals, Antineoplastics, Cycloparaffins, Hydrocarbons, Terpenes, Taxoids, University of Milan.

Studies from University of Minnesota Have Provided New Data on Cardiology (Incidence of Undetectable, Measurable, and Increased Cardiac Troponin I Concentrations Above the 99th Percentile Using a High-Sensitivity vs a Contemporary Assay in ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting originating in Minneapolis, Minnesota, by NewsRx journalists, research stated, "We compared the incidence of undetectable [below the limit of detection (LoD)], measurable (LoD to 99th percentile), and increased cardiac troponin I (cTnI) concentrations above the 99th percentile between Abbott high-sensitivity cTnI (hs-cTnI) and contemporary cTnI assays in a US emergency department population. Patients (n = 2100) presenting to the emergency department who had serial cTnI (0, 3, 6, 9 h) measurements ordered on clinical indication were enrolled."

The news reporters obtained a quote from the research from the University of Minnesota, "Contemporary cTnI [Abbott Architect used clinically; 99th percentile: 0.030 mg/L (30 ng/L)] and hs-cTnI [Abbott investigational; sex-specific 99th percentiles: female (F) 16 ng/L, male (M) 34 ng/L] assays simultaneously measured fresh EDTA plasma. The hs-cTnI assay measured fewer undetectable cTnI concentrations compared to the contemporary cTnI assay across baseline (F: 31% vs 47%, M: 22% vs 40%) and serial (F: 21% vs 46%; M: 19% vs 54%) measurements. Conversely, the proportion of measurable cTnI concentrations was higher using hs-cTnI compared to contemporary cTnI assay across both baseline (F: 46% vs 31%; M: 60% vs 33%) and serial (F: 48% vs 28%; M: 83% vs 40%) measurements. The overall proportion of patients with increased cTnI concentrations above the 99th percentile was not significantly different between the contemporary (31%) and hs-cTnI (26%) assays (P = 0.09). In patients presenting to the emergency department, the use of the Abbott hs-cTnI assay provides clinicians with more numeric cTnI concentrations."

According to the news reporters, the research concluded: "This occurs via a shift from results below the LoD to those between the LoD and the 99th percentile and does not increase in the number of cTnI concentrations above the 99th percentile." For more information on this research see: Incidence of Undetectable, Measurable, and Increased Cardiac Troponin I Concentrations Above the 99th Percentile Using a High-Sensitivity vs a Contemporary Assay in Patients Presenting to the Emergency Department. Clinical Chemistry, 2016;62(8):1115-1119. Clinical Chemistry can be contacted at: Amer Assoc Clinical Chemistry, 2101 L Street NW, Suite 202, Washington, DC 20037-1526, USA.

Our news correspondents report that additional information may be obtained by contacting S.A. Love, University of Minnesota, Minneapolis, MN, United States. Additional authors for this research include Y. Sandoval, S.W. Smith, J. Nicholson, J. Cao, R. Ler, K. Schulz and F.S. Apple.

Studies from University of Minnesota Provide New Data on Cardiology (An integrated statistical model for enhanced murine cardiomyocyte differentiation via optimized engagement of 3D extracellular matrices)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting originating in Minneapolis, Minnesota, by NewsRx journalists, research stated, "The extracellular matrix (ECM) impacts stem cell differentiation, but identifying formulations supportive of differentiation is challenging in 3D models. Prior efforts involving combinatorial ECM arrays seemed intuitively advantageous."

The news reporters obtained a quote from the research from the University of Minnesota, "We propose an alternative that suggests reducing sample size and technological burden can be beneficial and accessible when coupled to design of experiments approaches. We predict optimized ECM formulations could augment differentiation of cardiomyocytes derived in vitro. We employed native chemical ligation to polymerize 3D poly (ethylene glycol) hydrogels under mild conditions while entrapping various combinations of ECM and murine induced pluripotent stem cells. Systematic optimization for cardiomyocyte differentiation yielded a predicted solution of 61%, 24%, and 15% of collagen type I, laminin-111, and fibronectin, respectively. This solution was confirmed by increased numbers of cardiac troponin T, a-myosin heavy chain and a-sarcomeric actinin-expressing cells relative to suboptimum solutions. Cardiomyocytes of composites exhibited connexin43 expression, appropriate contractile kinetics and intracellular calcium handling. Further, adding a modulator of adhesion, thrombospondin-1, abrogated cardiomyocyte differentiation. Thus, the integrated biomaterial platform statistically identified an ECM formulation best supportive of cardiomyocyte differentiation."

According to the news reporters, the research concluded: "In future, this formulation could be coupled with biochemical stimulation to improve functional maturation of cardiomyocytes derived in vitro or transplanted in vivo."

For more information on this research see: An integrated statistical model for enhanced murine cardiomyocyte differentiation via optimized engagement of 3D extracellular matrices. *Scientific Reports*, 2015;5():18705. Studies from University of Minnesota Update Current Data on Heart Attack (Novel resuscitation devices facilitate complete neurologic recovery after prolonged cardiac arrest in postanesthesia care unit)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news reporting originating in Minneapolis, Minnesota, by NewsRx journalists, research stated, "Cardiac arrest in the perioperative period is associated with significant morbidity and mortality."

The news reporters obtained a quote from the research from the University of Minnesota, "Novel resuscitation devices may afford patients improved survival and limit neurologic injury. We report a case of cardiac arrest in the postanesthesia care unit that required an extensive period of cardiopulmonary resuscitation assisted by the ResQPOD impedance threshold device to optimize coronary perfusion and a LUCAS chest compression system to maintain optimal cardiopulmonary resuscitation while transporting the patient to the cardiac catheterization laboratory."

According to the news reporters, the research concluded: "Furthermore, after stabilization for an occluded left anterior descending artery with stent placement, an institutional hypothermia protocol was initiated using Thermogard XP Temperature Management system for 24 hours."

Our news correspondents report that additional information may be obtained by contacting W.C. Cingi, University of Minnesota, Dept. of Anesthesiol, Minneapolis, MN 55455, United States. Additional authors for this research include L.A. McMahon and R.C. Prielipp.

Studies from University of Minnesota in the Area of Cancer Risk Reported (Effects of green tea catechin extract on serum lipids in postmenopausal women: a randomized, placebo-controlled clinical trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Cancer Risk is now available. According to news originating from St. Paul, Minnesota, by NewsRx correspondents, research stated, "Green tea has been suggested to improve cardiovascular disease risk factors, including circulating lipid variables. However, current evidence is predominantly based on small, short-term randomized controlled trials conducted in diverse populations."

Our news journalists obtained a quote from the research from the University of Minnesota, "The aim of this study was to examine the efficacy and impact of green tea extract (GTE) supplementation high in epigallocatechin gallate (EGCG) on blood lipids in healthy postmenopausal women. This was an ancillary study of a double-blind, randomized, placebo-controlled, parallel-arm trial investigating the effects of a GTE supplement containing 1315 mg catechins (843 mg EGCG) on biomarkers of breast cancer risk. Participants were randomly assigned to receive GTE (n = 538) or placebo (n = 537) and were stratified by catechol-O-methyltransferase (COMT) genotype activity (high COMT compared with low or intermediate COMT genotype activity). They consumed either 4 GTE or identical placebo capsules daily for 12 mo. A total of 936 women completed this substudy. Circulating lipid panels including total cholesterol (TC), HDL cholesterol, and triglycerides were measured at baseline and at months 6 and 12. Compared with placebo, 1-y supplementation with GTE capsules resulted in a significant reduction in circulating TC (-2.1% compared with 0.7%; P = 0.0004), LDL cholesterol (-4.1% compared with 0.9%; P< 0.0001) and non-HDL cholesterol (-3.1% compared with 0.4%; P = 0.0032). There was no change in HDL-cholesterol concentration, but triglyceride concentrations increased by 3.6% in the GTE group, whereas they decreased by 2.5% in the placebo group (P = 0.046). A significant reduction in TC was observed only among women with high (i.e., \( \geq 200 \text{ mg/dL} \) baseline TC concentrations (P-interaction = 0.01) who consumed GTE capsules. The effect of GTE on the increase in triglycerides was mainly observed among obese women and statin users (P-interaction = 0.06)."

According to the news editors, the research concluded: "Supplementation with GTE significantly reduced circulating TC and LDL-cholesterol concentrations, especially in those with elevated baseline TC concentrations."

Cardiovascular Diseases and Conditions -...

Studies from University of Minnesota in the Area of Hypertension Described (Angiotensin II-Induced Hypertension Is Attenuated by Overexpressing Copper/Zinc Superoxide Dismutase in the Brain Organum Vasculosum of the Lamina Terminalis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Hypertension is the subject of a report. According to news originating from St. Paul, Minnesota, by NewsRx correspondents, research stated, "Angiotensin II (AngII) can access the brain via circumventricular organs (CVOs), including the subfornical organ (SFO) and organum vasculosum of the lamina terminalis (OVLT), to modulate blood pressure. Previous studies have demonstrated a role for both the SFO and OVLT in the hypertensive response to chronic AngII, yet it is unclear which intracellular signaling pathways are involved in this response."

Financial supporters for this research include University of Minnesota, National Heart, Lung, and Blood Institute.

Our news journalists obtained a quote from the research from the University of Minnesota, "Overexpression of copper/zinc superoxide dismutase (CuZnSOD) in the SFO has been shown to attenuate the chronic hypertensive effects of AngII. Presently, we tested the hypothesis that elevated levels of superoxide (O2 (∙-)) in the OVLT contribute to the hypertensive effects of AngII. To facilitate overexpression of superoxide dismutase, adenoviral vectors encoding human CuZnSOD or control adenovirus (AdEmpty) were injected directly into the OVLT of rats. Following 3 days of control saline infusion, rats were intravenously infused with AngII (10 ng/kg/min) for ten days. Blood pressure increased 33 ± 8 mmHg in AdEmpty rats (n=6), while rats overexpressing CuZnSOD (n=8) in the OVLT demonstrated a blood pressure increase of only 18 ± 5 mmHg after 10 days of AngII infusion."

According to the news editors, the research concluded: "These results support the hypothesis that overproduction of O2 (∙-) in the OVLT plays an important role in the development of chronic AngII-dependent hypertension."

For more information on this research see: Angiotensin II-Induced Hypertension Is Attenuated by Overexpressing Copper/Zinc Superoxide Dismutase in the Brain Organum Vasculosum of the Lamina Terminalis. Oxidative Medicine and Cellular Longevity, 2016;2016 ():3959087. (Hindawi Publishing - www.hindawi.com; Oxidative Medicine and Cellular Longevity - www.hindawi.com/journals/oximed/)

The news correspondents report that additional information may be obtained from J.P. Collister, Dept. of Veterinary and Biomedical Sciences, College of Veterinary Medicine, University of Minnesota, St Paul, MN 55108, United States. Additional authors for this research include H. Taylor-Smith, D. Drebes, D. Nahey, J. Tian and M.C Zimmerman.

**Fungal Diseases and Conditions - Candida albicans**

**Studies from University of Missouri Add New Findings in the Area of Candida albicans (A Combination Fluorescence Assay Demonstrates Increased Efflux Pump Activity as a Resistance Mechanism in Azole-Resistant Vaginal Candida albicans Isolates)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Fungal Diseases and Conditions - Candida albicans. According to news reporting originating in Kansas City, Missouri, by NewsRx journalists, research stated, "Candida albicans is a pathogenic fungus causing vulvovaginal candidiasis (VVC). Azole drugs, such as fluconazole, are the most common treatment for these infections."

The news reporters obtained a quote from the research from the University of Missouri, "Recently, azole-resistant vaginal C. albicans isolates have been detected in patients with recurring and refractory vaginal infections. However, the mechanisms of resistance in vaginal C. albicans isolates have not been studied in detail. In oral and systemic resistant isolates, overexpression of the ABC transporters Cdr1p and Cdr2p and the major facilitator transporter Mdr1p is associated with resistance. Sixteen fluconazole-susceptible and 22 fluconazole-resistant vaginal C. albicans isolates were obtained, including six matched sets containing a susceptible and a resistant isolate, from individual patients. Using quantitative real-time reverse transcriptase PCR (qRT-PCR), 16 of 22 resistant isolates showed overexpression of at least one efflux pump gene, while only 1 of 16 susceptible isolates showed such overexpression. To evaluate the pump activity associated with overexpression, an assay that combined data from two separate fluorescent assays using rhodamine 6G and alanine beta-naphthylamide was developed. The qRT-PCR results and activity assay results were in good agreement. This combination of two fluorescent assays can be used to study efflux pumps as resistance mechanisms in clinical isolates."

According to the news reporters, the research concluded: "These results demonstrate that efflux pumps are a significant resistance mechanism in vaginal C. albicans isolates."

Our news correspondents report that additional information may be obtained by
Studies from University of Missouri Have Provided New Data on Atherosclerosis [TRAF3IP2 mediates atherosclerotic plaque development and vulnerability in ApoE(-/-) mice]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Atherosclerosis. According to news reporting originating from Columbia, Missouri, by NewsRx correspondents, research stated, "Atherosclerosis is a major cause of heart attack and stroke. Inflammation plays a critical role in the development of atherosclerosis."

Our news editors obtained a quote from the research from the University of Missouri, "Since the cytoplasmic adaptor molecule TRAF3IP2 (TRAF3-Interacting Protein 2) plays a causal role in various autoimmune and inflammatory diseases, we hypothesized that TRAF3IP2 mediates atherosclerotic plaque development. TRAF3IP2/ApoE double knockout (DKO) mice were generated by crossing TRAF3IP2(-/-) and ApoE(-/-) mice. ApoE(-/-) mice served as controls. Both DKO and control mice were fed a high-fat diet for 12 weeks. Plasma lipids were measured by ELISA, atherosclerosis by en face analysis of aorta and plaque cross-section measurements at the aortic valve region, plaque necrotic core area, collagen and smooth muscle cell (SMC) content by histomorphometry, and aortic gene expression by RT-qPCR. The plasma lipoprotein profile was not altered by TRAF3IP2 gene deletion in ApoE(-/-) mice. While total aortic plaque area was decreased in DKO female, but not male mice, the plaque necrotic area was significantly decreased in DKO mice of both genders. Plaque collagen and SMC contents were increased significantly in both female and male DKO mice compared to respective controls. Aortic expression of proinflammatory cytokine (Tumor necrosis factor alpha, TNF alpha), chemokine (Chemokine (C-X-C motif) Ligand 1, CXCL1) and adhesion molecule (Vascular cell adhesion molecule 1, VCAM1; and Intercellular adhesion molecule 1, ICAM1) gene expression were decreased in both male and female DKO mice. In addition, the male DKO mice expressed markedly reduced levels of extracellular matrix (ECM)-related genes, including TIMP1 (Tissue inhibitor of metalloproteinase 1), RECK (Reversion-Inducing-Cysteine-Rich Protein with Kazal Motifs) and ADAM17 (A Disintegrin And Metalloproteinase 17). TRAF3IP2 plays a causal role in atherosclerotic plaque development and vulnerability, possibly by inducing the expression of multiple proinflammatory mediators."

According to the news editors, the research concluded: "TRAF3IP2 could be a potential therapeutic target in atherosclerotic vascular diseases."
For more information on this research see: TRAF3IP2 mediates atherosclerotic plaque development and vulnerability in ApoE(-/-) mice. *Atherosclerosis*, 2016;252():153-160. *Atherosclerosis* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Autoimmune Diseases and Conditions - Rheumatoid...

**Studies from University of Montpellier Reveal New Findings on Rheumatoid Arthritis (X-Linked miRNAs Associated with Gender Differences in Rheumatoid Arthritis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Autoimmune Diseases and Conditions - Rheumatoid Arthritis have been presented. According to news reporting from Montpellier, France, by NewsRx journalists, research stated, "Rheumatoid arthritis (RA) is an autoimmune disease that predominantly affects women. MicroRNAs have emerged as crucial regulators of the immune system, whose expression is deregulated in RA."

The news correspondents obtained a quote from the research from the University of Montpellier, "We aimed at quantifying the expression level of 14 miRNAs located on the X chromosome and at identifying whether differences are associated with disease and/or sex. A case-control study of 21 RA patients and 22 age-and sex-matched healthy controls was performed on peripheral blood mononuclear cells. The expression level of five miRNAs (miR-221, miR-222, miR-532, miR-106a, and miR-98) was significantly different between RA and controls when stratifying by sex, and the expression level of four miRNAs (miR-222, miR-532, miR-98, and miR-92a) was significantly different between RA females and males. The expression quantitative trait loci (eQTL) analysis revealed a significant gender effect of the FoxP3 promoter polymorphism rs3761548A/C on miR-221, miR-222 and miR-532 expression levels, and of the FoxP3 polymorphism rs2232365A/G on miR-221 expression levels in PBMC of RA patients. These data further support the involvement of the X chromosome in RA susceptibility."

According to the news reporters, the research concluded: "X-linked miRNAs, in the context of sex differences, might provide novel insight into new molecular mechanisms and potential therapeutic targets in RA for disease treatment and prevention."

For more information on this research see: X-Linked miRNAs Associated with Gender Differences in Rheumatoid Arthritis. *International Journal of Molecular Sciences*, 2016;17(11):1385-1397. *International Journal of Molecular Sciences* can be contacted at:
Studies from University of Montreal in the Area of Hepatitis C Virus Described (Novel E2 Glycoprotein Tetramer Detects Hepatitis C Virus-Specific Memory B Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Liver Diseases and Conditions - Hepatitis C Virus. According to news reporting from Montreal, Canada, by NewsRx journalists, research stated, "Acute hepatitis C virus (HCV) infection culminates in viral persistence in the majority of cases. Abs that recognize the envelope glycoproteins E1 and E2 are generated during the late stages of acute infection, yet their contribution to spontaneous viral clearance remains controversial."

The news correspondents obtained a quote from the research from the University of Montreal, "Investigation of the humoral responses during acute HCV infection have been limited by the inability to directly identify and characterize HCV-specific B cells. In this study we describe the development of a novel tetramer of the E2 glycoprotein ectodomain (J6, genotype 2a strain), which allowed us to visualize E2-specific B cells longitudinally in the peripheral blood of HCV-infected individuals. HCV-specific class-switched memory B cells were detected in 3 out of 7 participants during late acute infection, with a mean frequency of 0.63% for positive samples (range 0.16-0.67%) and in 7 out of 7 participants with chronic infection with a mean frequency of 0.47% (range 0.20-0.78%). In a cross-sectional study, E2 tetramer positive population was detected in 28 out of 31 chronically infected individuals. Deep sequencing of the BCR from E2-specific class-switched memory B cells sorted from two independent participants revealed a focused repertoire suggestive of clonal selection. Tetramer-specific B cells exhibited skewed CDR3 length distribution and increased mutation frequency compared with naive B cells. This BCR profile is indicative of clonal expansion and affinity maturation."

According to the news reporters, the research concluded: "E2 tetramer allows for specific and sensitive ex vivo characterization of rare HCV-specific B cells in infected individuals, and will enable researchers to gain a better understanding of humoral immunity in HCV infection."

For more information on this research see: Novel E2 Glycoprotein Tetramer Detects Hepatitis C Virus-Specific Memory B Cells. *Journal of Immunology*, 2016;197(12):4848-4858. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike,
Studies from University of Nantes Have Provided New Data on Osteoporosis (Inhibition of BET proteins and epigenetic signaling as a potential treatment for osteoporosis)

2017 JAN 14 (NewsRx) -- Researchers detail new data in Musculoskeletal Diseases and Conditions - Osteoporosis. According to news reporting originating from Nantes, France, by NewsRx correspondents, research stated, "Histone modifications are important for maintaining the transcription program. BET proteins, an important class of 'histone reading proteins', have recently been described as essential in bone biology."

Financial supporters for this research include Seventh Framework Programme, INSERM (Institut National de la Sante et de la Recherche Medicale), Region Pays de la Loire.

Our news editors obtained a quote from the research from the University of Nantes, "This study presents the therapeutic opportunity of BET protein inhibition in osteoporosis. We find that the pharmacological BET protein inhibitor JQ1 rescues pathologic bone loss in a post-ovariectomy osteoporosis model by increasing the trabecular bone volume and restoring mechanical properties. The BET protein inhibition suppresses osteoclast differentiation and activity as well as the osteoblastogenesis in vitro. Moreover, we show that treated non-resorbing osteoclasts could still activate osteoblast differentiation. In addition, specific inhibition of BRD4 using RNA interference inhibits osteoclast differentiation but strongly activates osteoblast mineralization activity. Mechanistically, JQ1 inhibits expression of the master osteoclast transcription factor NFATc1 and the transcription factor of osteoblast Runx2."

According to the news editors, the research concluded: "These findings strongly support that targeting epigenetic chromatin regulators such as BET proteins may offer a promising alternative for the treatment of bone-related disorders such as osteoporosis."

For more information on this research see: Inhibition of BET proteins and epigenetic signaling as a potential treatment for osteoporosis. Bone, 2017;94():10-21. Bone can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Bone - www.journals.elsevier.com/bone/)

The news editors report that additional information may be obtained by contacting B. Ory, Univ Nantes, Physiopathol Resorpt Osseuse & Therapie Tumeurs O, Nantes Atlantique.
Studies from University of Naples Federico II Update Current Data on Atherosclerosis (A Prospective Natural History Study of Coronary Atherosclerosis Using Fractional Flow Reserve)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Atherosclerosis. According to news reporting out of Naples, Italy, by NewsRx editors, research stated, "In patients with coronary artery disease, clinical outcome depends on the extent of reversible myocardial ischemia. Whether the outcome also depends on the severity of the stenosis as determined by fractional flow reserve (FFR) remains unknown."

Our news journalists obtained a quote from the research from the University of Naples Federico II, "This study sought to investigate the relationship between FFR values and vessel-related clinical outcome. We prospectively studied major adverse cardiovascular events (MACE) at 2 years in 607 patients in whom all stenoses were assessed by FFR and who were treated with medical therapy alone. The relationship between FFR and 2-year MACE was assessed as a continuous function. Logistic and Cox proportional hazards regression models were used to calculate the average decrease in the risk of MACE per 0.05-U increase in FFR. MACE occurred in 272 (26.5%) of 1,029 lesions. Target lesions with diameter stenosis >= 70% were more often present in the MACE group (p < 0.01). Median FFR was significantly lower in the MACE group versus the non-MACE group (0.68 [interquartile range: 0.54 to 0.77] vs. 0.80 [interquartile range: 0.70 to 0.88]; p < 0.01). The cumulative incidence of MACE significantly increased with increasing FFR quartiles. An average decrease in MACE per 0.05-unit increase in FFR was statistically significant even after adjustment for all clinical and angiographic features (odds ratio: 0.81; 95% confidence interval: 0.76 to 0.86)). The strongest increase in MACE occurred for FFR values between 0.80 and 0.60. In multivariable Cox regression analysis, FFR was significantly associated with MACE up to 2 years (hazard ratio: 0.87; 95% confidence interval: 0.83 to 0.91))."

According to the news editors, the research concluded: "In patients with stable coronary disease, stenosis severity as assessed by FFR is a major and independent predictor of lesion-related outcome."

For more information on this research see: A Prospective Natural History Study of Coronary Atherosclerosis Using Fractional Flow Reserve. *Journal of the American College of Cardiology*, 2016;68(21):2247-2255. *Journal of the American College of Cardiology* can be
Studies from University of Navarra Describe New Findings in Heart Failure (The personal experience of living with chronic heart failure: a qualitative meta-synthesis of the literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Failure have been published. According to news reporting out of Pamplona, Spain, by NewsRx editors, research stated, "Aims and objectives. To determine, from a systematic literature review, the experience of living with heart failure and to propose some practice guidelines and research questions."

Financial support for this research came from Universidad de Navarra.

Our news journalists obtained a quote from the research from the University of Navarra, "Chronic heart failure has been one of the fastest growing illnesses in recent decades, with almost 23 million people affected worldwide. This complex syndrome has multiple causes and appears when underlying heart disease is advanced. Currently, heart failure has no cure and leads to a significant deterioration in patients' quality of life. Qualitative meta-synthesis. A qualitative meta-synthesis was conducted to extract and analyse qualitative research from the Cochrane, PubMed, CINAHL, PsycINFO, Web of Science and Cuiden databases. Snowball sampling and a manual search were performed to identify other relevant studies. Twenty-five qualitative studies were selected. The findings indicate that there are three main themes that describe the phenomenon. The first theme refers to the experiences related to the beginning of the process. The second theme is connected with the effects on the person: physical, emotional, social and spiritual changes. The third theme is linked with how to live with heart failure despite the illness, including the adjustment and coping process and how external resources can help them to manage. Heart failure has a major impact on the entire person, but some areas have not been addressed. By creating new tools to understand and evaluate the impact of this illness and interventions that prevent or improve some situations, we can promote the well-being and the quality of life of this population. Relevance to clinical practice. Nurses must have a personal knowledge of the experiences and needs of the patients."

According to the news editors, the research concluded: "To do this, nurses should create care environments that promote an exchange of experiences and knowledge between the nurse and the patient and family."

For more information on this research see: The personal experience of living with chronic heart failure: a qualitative meta-synthesis of the literature. Journal of Clinical Nursing,
Studies from University of Navarra Have Provided New Data on Drug Delivery Systems (EGF-liposomes promote efficient EGFR targeting in xenograft colocolcarcima model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Drug Delivery Systems have been published. According to news originating from Pamplona, Spain, by NewsRx correspondents, research stated, "Development of EGF-liposomes (LP-EGF) for selective molecules delivery in tumors expressing EGFR. In vitro cellular interaction of EGF-LP and nontargeted liposomes (LP-N) was assayed at 37 and 4 °C in cells expressing different EGFR levels."

Our news journalists obtained a quote from the research from the University of Navarra, "Receptor-mediated uptake was investigated by competition with a monoclonal antibody anti-EGFR. Selective intracellular drug delivery and efficacy was tested by oxaliplatin encapsulation. In vivo biodistribution of LP-N and LP-EGF was done in xenograft model. LP-EGF was internalized by an active and selective mechanism through EGFR without receptor activation. Oxaliplatin LP-EGF decreased IC[50] between 48 and 13% in cell EGFR+. LP-EGF was accumulated in tumor over 72 h postdosing, while LP-N in spleen."

According to the news editors, the research concluded: "LP-EGF represents an attractive nanosystem for cancer therapy or diagnosis."

The news correspondents report that additional information may be obtained from S. Zalba, Dept. of Pharmacy & Pharmaceutical Technology, School of Pharmacy, University of Navarra, Pamplona, Spain. Additional authors for this research include A.M. Contreras, M. Merino, I. Navarro, C.T. de Ilarduya, I.F. Troconiz, G. Koning and M.J. Garrido.

Studies from University of Nebraska Yield New Data on Aggressive Behavior Research (Measuring Individual Differences in Responses to Date-Rape Vignettes Using Latent Variable Models)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Behavior Research - Aggressive Behavior Research have been published. According to news reporting out of Lincoln, Nebraska, by NewsRx editors, research stated, "Vignette methodology can be a flexible and powerful way to examine individual differences in response to dangerous real-life scenarios. However, most studies underutilize the usefulness of such methodology by analyzing only one outcome, which limits the ability to track event-related changes (e.g., vacillation in risk perception)."

Our news journalists obtained a quote from the research from the University of Nebraska, "The current study was designed to illustrate the dynamic influence of risk perception on exit point from a date-rape vignette. Our primary goal was to provide an illustrative example of how to use latent variable models for vignette methodology, including latent growth curve modeling with piecewise slopes, as well as latent variable measurement models."

According to the news editors, the research concluded: "Through the combination of a step-by-step exposition in this text and corresponding model syntax available electronically, we detail an alternative statistical 'blueprint' to enhance future violence research efforts using vignette methodology."

Our news journalists report that additional information may be obtained by contacting D.E. McChargue, University of Nebraska, Dept. of Psychol, Lincoln, NE 68588, United States. Additional authors for this research include L. Hoffman and D.E. McChargue.

Studies from University of North Carolina Further Understanding of HIV/AIDS (Recruiting the social contacts of patients with STI for HIV screening in Lilongwe, Malawi: process evaluation and assessment of acceptability)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immune System Diseases and Conditions - HIV/AIDS. According to news reporting originating from Chapel Hill, North Carolina, by NewsRx correspondents, research stated, "To explore acceptability of recruiting social contacts for HIV and sexually transmitted infection (STI) screening in Lilongwe, Malawi. In this observational study, three groups of 'seed' patients were enrolled: 45 HIV-infected patients with STI, 45 HIV-uninfected patients with STI and 45 community controls, who were also tested for HIV as part of the study."

Financial support for this research came from National Institute of Allergy and Infectious Diseases.

Our news editors obtained a quote from the research from the University of North Carolina, "Each seed was given five coupons and asked to recruit up to five social contacts to the STI clinic. Seeds were told the programme for contacts would include HIV testing, STI screening and general health promotion. Seeds were asked to return after 1 month to report on the contact recruitment process. Seeds received $2 for each successfully recruited contact. Eighty-nine seeds (66%) returned for 1-month follow-up with no difference between the three seed groups (p=0.9). Returning seeds reported distributing most of their coupons (mean=4.1) and discussing each feature of the programme with most contacts-HIV testing (90%), STI screening (87%) and health promotion (91%). Seeds reported discussing their own HIV status with most contacts (52%), with a lower proportion of HIV-infected seeds discussing their HIV status (22%) than HIV-uninfected seeds (81%) or community seeds (64%) (p <0.001). Contact recruitment did not vary with socioeconomic status. Most seeds distributed all coupons and reported describing all aspects of the programme to most contacts."

According to the news editors, the research concluded: "Patients with STI are able to act as health promoters within their social networks and may be a critical link to increasing STI and HIV status awareness among high-risk groups."

For more information on this research see: Recruiting the social contacts of patients with STI for HIV screening in Lilongwe, Malawi: process evaluation and assessment of acceptability. *Sexually Transmitted Infections*, 2016;92(8):587-591,103. *Sexually Transmitted Infections* can be contacted at: Bmj Publishing Group, British Med Assoc House, Tavistock Square, London WC1H 9JR, England. Lung Diseases

Studies from University of North Carolina Have Provided New Data on Lung Diseases (Short Palate, Lung, and Nasal Epithelial Clone 1 Has Antimicrobial and Antibiofilm Activities against the Burkholderia cepacia Complex)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Lung Diseases is now available. According to news reporting originating from Chapel Hill, North Carolina, by NewsRx correspondents, research stated, "The opportunistic bacteria of the Burkholderia cepacia complex (Bcc) are extremely pathogenic to cystic fibrosis (CF) patients, and acquisition of Bcc bacteria is associated with a significant increase in mortality. Treatment of Bcc infections is difficult because the bacteria are multidrug resistant and able to survive in biofilms."

Funders for this research include HHS | National Institutes of Health (NIH), Cystic Fibrosis Trust.

Our news editors obtained a quote from the research from the University of North Carolina, "Short palate, lung, and nasal epithelial clone 1 (SPLUNC1) is an innate defense protein that is secreted by the upper airways and pharynx. While SPLUNC1 is known to have antimicrobial functions, its effects on Bcc strains are unclear. We therefore tested the hypothesis that SPLUNC1 is able to impair Bcc growth and biofilm formation. We found that SPLUNC1 exerted bacteriostatic effects against several Bcc clinical isolates, including B. cenocepacia strain J2315 (50% inhibitory concentration [IC50] = 0.28 μM), and reduced biofilm formation and attachment (IC50 = 0.11 μM). We then determined which domains of SPLUNC1 are responsible for its antimicrobial activity. Deletions of SPLUNC1’s N terminus and alpha 6 helix did not affect its function. However, deletion of the alpha 4 helix attenuated antimicrobial activity, while the corresponding alpha 4 peptide displayed antimicrobial activity. Chronic neutrophilia is a hallmark of CF lung disease, and neutrophil elastase (NE) cleaves SPLUNC1. However, we found that the ability of SPLUNC1 to disrupt biofilm formation was significantly potentiated by NE pretreatment."

According to the news editors, the research concluded: "While the impact of CF on SPLUNC1-Bcc interactions is not currently known, our data suggest that understanding this interaction may have important implications for CF lung disease."

For more information on this research see: Short Palate, Lung, and Nasal Epithelial Clone 1 Has Antimicrobial and Antibiofilm Activities against the Burkholderia cepacia Complex. Antimicrobial Agents and Chemotherapy, 2016;60(10):6003-6012. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Oncology - Cancer Care

Studies from University of North Carolina Yield New Data on Cancer Care (The influence of dyadic symptom distress on threat appraisals and self-efficacy in advanced cancer and caregiving)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Cancer Care is now available. According to news reporting originating in Chapel Hill, North Carolina, by NewsRx journalists, research stated, "Physical and psychological symptoms experienced by patients with advanced cancer influence their well-being; how patient and family caregiver symptom distress influence each other's well-being is less understood. This study examined the influence of patient and caregiver symptom distress on their threat appraisals and self-efficacy to cope with cancer."

Financial supporters for this research include National Cancer Institute, Horace H. Rackham School of Graduate Studies, University of Michigan, Foundation for the National Institutes of Health.

The news reporters obtained a quote from the research from the University of North Carolina, "We conducted a secondary analysis of baseline data from an RCT that enrolled patients with advanced cancer and their family caregivers (N = 484 dyads). Structural equation modeling and the actor-partner interdependence mediation model (APIMeM) were used to examine two models: threat appraisals as a mediator of the relationship between symptom distress and individual and family-related self-efficacy; and, self-efficacy (individual and family dimensions) as mediators of the relationship between symptom distress and threat appraisals. Data suggest the self-efficacy mediation model was the preferred model. More patient and caregiver symptom distress was directly associated with their own lower self-efficacy and more threatening appraisals. Patient and caregiver individual self-efficacy also mediated the relationship between their own symptom distress and threat appraisals. There were also significant interdependent effects. More patient symptom distress was associated with less caregiver family-related self-efficacy, and more caregiver symptom distress was directly associated with more threatening patient appraisals. Patient and caregiver symptom distress influenced their own and in some cases each other's cognitive appraisals. Limitations of this study include the use of cross-sectional data and assessments of individually-focused (vs. family-focused) threat appraisals."
According to the news reporters, the research concluded: "These findings highlight the need to consider the management of patient and caregiver symptoms during advanced cancer."

For more information on this research see: The influence of dyadic symptom distress on threat appraisals and self-efficacy in advanced cancer and caregiving. Supportive Care in Cancer, 2017;25(1):185-194. Supportive Care in Cancer can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Clinical Research - Clinical Trials and Studies

Studies from University of North Carolina Yield New Information about Clinical Trials and Studies [The electronic medication complete communication (EMC2) study: Rationale and methods for a randomized controlled trial of a strategy to promote ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Clinical Research - Clinical Trials and Studies have been published. According to news reporting from Chapel Hill, North Carolina, by NewsRx journalists, research stated, "Adverse drug events (ADEs) affect millions of patients annually and place a significant burden on the healthcare system. The Food and Drug Administration (FDA) has developed patient safety information for high risk medications that pose serious public health concerns."

The news correspondents obtained a quote from the research from the University of North Carolina, "However, there are currently few assurances that patients receive this information or are able to identify or respond correctly to ADEs. To evaluate the effectiveness of the Electronic Medication Complete Communication (EMC2) Strategy to promote safe medication use and reporting of ADEs in comparison to usual care. The automated EMC2 Strategy consists of: 1) provider alerts to counsel patients on medication risks, 2) the delivery of patient-friendly medication information via the electronic health record, and 3) an automated telephone assessment to identify potential medication concerns or ADEs. The study will take place in two community health centers in Chicago, IL Adult, English or Spanish-speaking patients (N = 1200) who have been prescribed a high-risk medication will be enrolled and randomized to the intervention arm or usual care based upon practice location. The primary outcomes of the study are medication knowledge, proper medication use, and reporting of ADEs; these will be measured at baseline, 4 weeks, and three months. Intervention fidelity as
well as barriers and costs of implementation will be evaluated. The EMC2 Strategy automates a patient-friendly risk communication and surveillance process to promote safe medication use while minimizing clinic burden.

According to the news reporters, the research concluded: "This trial seeks to evaluate the effectiveness and feasibility of this strategy in comparison to usual care."

For more information on this research see: The electronic medication complete communication (EMC2) study: Rationale and methods for a randomized controlled trial of a strategy to promote medication safety in ambulatory care. Contemporary Clinical Trials, 2016;51():72-77. Contemporary Clinical Trials can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Proteins - Nucleoproteins

Studies from University of North Carolina Yield New Information about Nucleoproteins (Molecular Recognition of Lys and Arg Methylation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Proteins - Nucleoproteins is the subject of a report. According to news reporting from Chapel Hill, North Carolina, by NewsRx journalists, research stated, "A network of reader proteins and enzymes precisely controls gene transcription through the dynamic addition, removal, and recognition of post-translational modifications (PTMs) of histone tails. Histone PTMs work in concert with this network to regulate gene transcription through the histone code, and the dysregulation of PTM maintenance is linked to a large number of diseases, including many types of cancer."

Funders for this research include Division of Chemistry, Division of Graduate Education, W.M. Keck Foundation.

The news correspondents obtained a quote from the research from the University of North Carolina, "A wealth of research aims to elucidate the functions of this code, but our understanding of the effects of PTMs, specifically the methylation of lysine (Lys) and arginine (Arg), is lacking. The development of new tools to study PTMs relies on a sophisticated understanding of the mechanisms that drive protein and small molecule recognition in water."

According to the news reporters, the research concluded: "In this review, we outline the physical organic concepts that drive the molecular recognition of Lys and Arg methylation
by reader proteins and draw comparisons to the binding mechanisms of small molecule receptors for methylated Lys and Arg that have been developed recently."

For more information on this research see: Molecular Recognition of Lys and Arg Methylation. *Ac**s Chemical Biology*, 2016;11(3):643-53. (American Chemical Society - www.acs.org; *Ac**s Chemical Biology - www.pubs.acs.org/journal/acbcct)

**DNA Research**

**Studies from University of North Carolina in the Area of DNA Research Described (The Rb binding domain of HPV31 E7 is required to maintain high levels of DNA repair factors in infected cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on DNA Research. According to news reporting originating in Chapel Hill, North Carolina, by NewsRx journalists, research stated, "Human papillomaviruses (HPV) exhibit constitutive activation of ATM and ATR DNA damage response (DDR) pathways, which are required for productive viral replication. Expression of HPV31 E7 alone is sufficient to activate the DDR through an unknown mechanism."

Funders for this research include NIH, American Cancer Society.

The news reporters obtained a quote from the research from the University of North Carolina, "Here, we demonstrate that the E7 Rb binding domain is required to increase levels of many DDR proteins, including ATM, Chk2, Chk1, the MRN components MRE11, Rad50, and NBS1, as well as the homologous recombination repair proteins BRCA1 and Rad51. Interestingly, we have found that the increase in these DNA repair proteins does not occur solely at the level of transcription, but that E7 broadly increases the half-life of these DDR factors, a phenotype that is lost in the E7 Rb binding mutant."

According to the news reporters, the research concluded: "These data suggest that HPV-31 upregulates DNA repair factors necessary for replication by increasing protein half-life in a manner requiring the E7 Rb binding domain."

For more information on this research see: The Rb binding domain of HPV31 E7 is required to maintain high levels of DNA repair factors in infected cells. *Virology*, 2017;500 ():22-34. *Virology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. DNA Research

Studies from University of North Carolina in the Area of DNA Research Reported (Investigating the impacts of DNA binding mode and sequence on thermodynamic quantities and water exchange values for two small molecule drugs)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in DNA Research. According to news originating from Chapel Hill, North Carolina, by NewsRx correspondents, research stated, "Doxorubicin and nogalamycin are antitumor antibiotics that interact with DNA via intercalation and threading mechanisms, respectively. Because the importance of water, particularly its impact on entropy changes, has been established in other biological processes, we investigated the role of water in these two drug-DNA binding events."

Funders for this research include Department of Chemistry and Chemical Engineering at Chalmers University of Technology, St. Lawrence University Fellowship Program.

Our news journalists obtained a quote from the research from the University of North Carolina, "We used the osmotic stress method to calculate the number of water molecules exchanged (Δn(water)), and water, isothermal titration calorimetry to measure K-binding, ΔH, and ΔS for two synthetic DNAs, poly(dA center dot dT) and poly(dG center dot dC), and calf thymus DNA (CT DNA). For nogalamycin, Δn(water) <0 for CT DNA and poly(dG center dot dC). For doxorubicin, Δn(water) > 0 for CT DNA and Δn(water) < 0 for poly(dG center dot dC). For poly(dA center dot dT), Δn(water)- 0 with both drugs. Net enthalpy changes were always negative, but net entropy changes depended on the drug."

According to the news editors, the research concluded: "The effect of water exchange on the overall sign of entropy change appears to be smaller than other contributions."

For more information on this research see: Investigating the impacts of DNA binding mode and sequence on thermodynamic quantities and water exchange values for two small molecule drugs. *Biophysical Chemistry*, 2016;216():9-18. *Biophysical Chemistry* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Biophysical Chemistry - www.journals.elsevier.com/biophysical-chemistry/)

**Drugs and Therapies - Indomethacin Therapy**

**Studies from University of Nottingham Have Provided New Information about Indomethacin Therapy (Indomethacin-Kollidon VA64 Extrudates: A Mechanistic Study of pH-Dependent Controlled Release)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Indomethacin Therapy have been published. According to news reporting from Nottingham, United Kingdom, by NewsRx journalists, research stated, "Because of its weakly acidic nature (pKa of 4.5), indomethacin presents an aqueous solubility that significantly increases when changing from acidic to neutral/alkaline pH (1.5 mg/mL at pH 1.2 and 105.2 mg/mL at pH 7.4). We have therefore investigated the impact of the dissolution medium pH on the dissolution performance of indomethacin:Kollidon VA64 extrudates."

Financial supporters for this research include AstraZeneca, Engineering and Physical Sciences Research Council.

The news correspondents obtained a quote from the research from the University of Nottingham, "The impact of the drug loading on the dissolution properties of these systems was also examined (5%, 15%, 30%, 50%, 70%, and 90% drug loading). Time-resolved Raman spectroscopy along with in-line UV-vis spectrophotometry was employed to directly relate changes in dissolution behavior to physicochemical changes that occur to the extrudate during the test. The dissolution tests were performed in pH 2 HCl (to mimic the stomach conditions), and this was then switched during the experiment to pH 6.8 phosphate buffer (to simulate the poststomach conditions). The rotating disc dissolution rate test was also used to simultaneously measure the dissolution rate of both the drug and the polymer. We found that in pH 2 HCl buffer, for the 15% or higher drug-loaded extrudates, Kollidon VA64 preferentially dissolves from the exterior of the compact leaving an amorphous drug-rich hydrophobic shell, which, similarly to an enteric coating, inhibits the drug release. The in situ formation of an enteric coating has been previously hypothesized, and this has been the first time that is directly observed in a pH-variable dissolution test. The dissolution medium switch to pH 6.8 phosphate buffer, due to the large increase of the aqueous solubility of indomethacin at this pH, leads to rapid dissolution of the material forming the coating and therefore total drug release."

According to the news reporters, the research concluded: "In contrast, the 5% extrudate is fully hydrated and quickly dissolves at low pH pointing to a dissolution performance dependent on highly water-soluble Kollidon VA64."

For more information on this research see: Indomethacin-Kollidon VA64 Extrudates: A Mechanistic Study of pH-Dependent Controlled Release. *Molecular Pharmaceutics*, 2016;13

Oncology - Gallbladder Cancer

Studies from University of Oklahoma Yield New Data on Gallbladder Cancer (MicroRNA aberrations: An emerging field for gallbladder cancer management)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gallbladder Cancer have been published. According to news reporting out of Oklahoma City, Oklahoma, by NewsRx editors, research stated, "Gallbladder cancer (GBC) is infrequent but most lethal biliary tract malignancy characterized by an advanced stage diagnosis and poor survival rates attributed to absence of specific symptoms and effective treatment options. These necessitate development of early prognostic/predictive markers and novel therapeutic interventions."

Our news journalists obtained a quote from the research from the University of Oklahoma, "MicroRNAs (miRNAs) are small, non-coding RNA molecules that play a key role in tumor biology by functioning like tumor suppressor-or onco-genes and their aberrant expression are associated with the pathogenesis of several neoplasms with overwhelming clinical implications. Since miRNA signature is tissue specific, here, we focused on current data concerning the miRNAs aberrations in GBC pathogenesis. In GBC, miRNAs with tumor suppressor activity (miR-135-5p, miR-335, miR-34a, miR-26a, miR-146b-5p, Mir-218-5p, miR-1, miR-145, mir-130a) were found downregulated, while those with oncogenic property (miR-20a, miR-182, mir-155) were upregulated. The expression profile of miRNAs was significantly associated with GBC prognosis and prediction, and forced over-expression/ inhibition of these miRNAs was shown to affect tumor growth and development. Further, differential expression of miRNAs in the blood samples of GBC patients suggest miRNAs as promising noninvasive biomarker."

According to the news editors, the research concluded: "Thus, miRNAs represent potential candidate for GBC management, though many hurdles need to be overcome before miRNAs therapy can be clinically applied to GBC prevention and treatment."

Our news journalists report that additional information may be obtained by contacting V. Chandra, Vishal Chandra, Dept. of Obstetrics and Gynecology, Stephenson Cancer Center, University of Oklahoma Health Sciences Center, Oklahoma City, OK 73104, United States. Additional authors for this research include J.J. Kim, B. Mittal and R. Rai.

Drugs and Therapies - Antiinfectives

Studies from University of Oklahoma in the Area of Antiinfectives
Described [Downregulation of Organic Anion Transporting Polypeptide (OATP) 1B1 Transport Function by Lysosomotropic Drug Chloroquine: Implication in OATP-Mediated Drug-Drug ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antiinfectives is now available. According to news reporting originating in Oklahoma City, Oklahoma, by NewsRx journalists, research stated, "Organic anion transporting polypeptide (OATP) 1B1 mediates the hepatic uptake of many drugs including lipid-lowering statins. Decreased OATP1B1 transport activity is often associated with increased systemic exposure of statins and statin-induced myopathy."

Financial supporters for this research include National Institute of Diabetes and Digestive and Kidney Diseases, U.S. National Library of Medicine, National Institute of General Medical Sciences.

The news reporters obtained a quote from the research from the University of Oklahoma, "Antimalarial drug chloroquine (CQ) is also used for long-term treatment of rheumatoid arthritis and systemic lupus erythematosus. CQ is lysosomotropic and inhibits protein degradation in lysosomes. The current studies were designed to determine the effects of CQ on OATP1B1 protein degradation, OATP1B1-mediated transport in OATP1B1-overexpressing cell line, and statin uptake in human sandwich-cultured hepatocytes (SCH). Treatment with lysosome inhibitor CQ increased OATP1B1 total protein levels in HEK293-OATP1B1 cells and in human SCH as determined by OATP1B1 immunoblot. In HEK293-FLAG-tagged OATP1B1 stable cell line, co-immunofluorescence staining indicated that intracellular FLAG-OATP1B1 is colocalized with lysosomal associated membrane glycoprotein (LAMP)-2, a marker protein of late endosome/lysosome. Enlarged LAMP-2-positive vacuoles with FLAG-OATP1B1 protein retained inside were readily detected in CQ-treated cells, consistent with blocking lysosomal degradation of OATP1B1 by CQ. In HEK293-OATP1B1 cells, without pre-incubation, CQ concentrations up to 100 mM did not affect OATP1B1-mediated [(3)H]E217G accumulation. However, pre-incubation with CQ at clinically relevant concentration(s) significantly decreased [(3)H]E217G and [(3)H]pitavastatin accumulation in HEK293-OATP1B1 cells and [(3)H]pitavastatin accumulation in human SCH. CQ pretreatment (25 mM, 2 h) resulted in ∼1.9-fold decrease in Vmax without affecting Km of OATP1B1-
mediated [(3)H]E217G transport in HEK293-OATP1B1 cells. Pretreatment with monensin and bafilomycin A1, which also have lysosome inhibition activity, significantly decreased OATP1B1-mediated transport in HEK293-OATP1B1 cells. Pharmacopeidemiologic studies using data from the U.S. Food and Drug Administration Adverse Event Reporting System indicated that CQ plus pitavastatin, rosuvastatin, and pravastatin, which are minimally metabolized by the cytochrome P450 enzymes, led to higher myopathy risk than these statins alone. In summary, the present studies report novel findings that lysosome is involved in degradation of OATP1B1 protein and that pre-incubation with lysosomotropic drug CQ downregulates OATP1B1 transport activity."

According to the news reporters, the research concluded: "Our in vitro data in combination with pharmacoepidemiologic studies support that CQ has potential to cause OATP-mediated drug-drug interactions."

Our news correspondents report that additional information may be obtained by contacting K. Alam, Dept. of Pharmaceutical Sciences, College of Pharmacy, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma 73117, United States. Additional authors for this research include S. Pahwa, X. Wang, P. Zhang, K. Ding, A.H. Abuznait, L. Li and W. Yue.

**Heart Disorders and Diseases - Patent Foramen Ovale**

**Studies from University of Oregon Have Provided New Information about Patent Foramen Ovale (Physiological impact of patent foramen ovale on pulmonary gas exchange, ventilatory acclimatization, and thermoregulation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Patent Foramen Ovale. According to news reporting originating in Eugene, Oregon, by NewsRx journalists, research stated, "The foramen ovale, which is part of the normal fetal cardiopulmonary circulation, fails to close after birth in similar to 35% of the population and represents a potential source of right-to-left shunt. Despite the prevalence of patent foramen ovale (PFO) in the general population, cardiopulmonary, exercise, thermoregulatory, and altitude physiologists may have underestimated the potential effect of this shunted blood flow
on normal physiological processes in otherwise healthy humans."

Financial support for this research came from Defense Medical Research & Development Program.

The news reporters obtained a quote from the research from the University of Oregon, "Because this shunted blood bypasses the respiratory system, it would not participate in either gas exchange or respiratory system cooling and may have impacts on other physiological processes that remain undetermined. The consequences of this shunted blood flow in PFO-positive (PFO+) subjects can potentially have a significant, and negative, impact on the alveolar-to-arterial oxygen difference (AaDO(2)), ventilatory acclimatization to high altitude and respiratory system cooling with PFO+ subjects having a wider AaDO(2) at rest, during exercise after acclimatization, blunted ventilatory acclimatization, and a higher core body temperature (similar to 0.4 degrees C) at rest and during exercise. There is also an association of PFO with high-altitude pulmonary edema and acute mountain sickness. These effects on physiological processes are likely dependent on both the presence and size of the PFO, with small PFOs not likely to have significant/measureable effects."

According to the news reporters, the research concluded: "The PFO can be an important determinant of normal physiological processes and should be considered a potential confounder to the interpretation of former and future data, particularly in small data sets where a significant number of PFO+ subjects could be present and significantly impact the measured outcomes."

For more information on this research see: Physiological impact of patent foramen ovale on pulmonary gas exchange, ventilatory acclimatization, and thermoregulation. *Journal of Applied Physiology*, 2016;121(2):512-517. *Journal of Applied Physiology* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

### Blood Pressure

**Studies from University of Oslo Further Understanding of Blood Pressure (Cardiac stroke volume variability measured non-invasively by three methods for detection of central hypovolemia in healthy humans)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Blood Pressure are discussed in a new report. According to news reporting from Oslo, Norway, by NewsRx journalists, research stated, "Hypovolemia decreases preload and cardiac stroke volume. Cardiac stroke volume (SV) and its variability (cardiac stroke volume variability, SVV) have been proposed as clinical tools for
detection of acute hemorrhage."

Financial support for this research came from The Research Council of Norway.

The news correspondents obtained a quote from the research from the University of Oslo, "We compared three non-invasive SV measurements and investigated if respiration-induced fluctuations in SV may detect mild and moderate hypovolemia in spontaneously breathing humans. Ten healthy subjects underwent experimental central hypovolemia induced by lower body negative pressure to -60 mmHg or onset of presyncopal symptoms. SV beat-to-beat was estimated simultaneously by ultrasound Doppler, finger arterial blood pressure curve and impedance cardiography. SVV was calculated by spectral analysis between 0.15 and 0.40 Hz. Relative changes in SV did not show significant differences between the methods. The SVV measured by ultrasound Doppler and arterial blood pressure curve decreased at -30 mmHg to 32 % (ultrasound Doppler: 95 % CI 18-47, arterial blood pressure curve: 95 % CI 21-43) and at maximal simulated hypovolemia to 23 % (ultrasound Doppler: 95 % CI 14-81) and 21 % (arterial blood pressure curve: 95 % CI 9-33) of baseline variability. The variability in cardiac stroke volume from the impedance cardiography did not change significantly during the simulated hypovolemia, to 88 and 76 % of baseline variability. Cardiac stroke volume estimated by ultrasound Doppler and by arterial blood pressure curve showed parallel variations beat-to-beat during simulated hemorrhage, whereas impedance cardiography did not appear to track beat-to-beat changes in cardiac stroke volume."

According to the news reporters, the research concluded: "The variability in cardiac stroke volume was decreased during mild and moderate hypovolemia and could be used for early detection of hypovolemia."

Oncology - Neuroendocrine Cancer

Studies from University of Oxford Provide New Data on Neuroendocrine Cancer (Changes in the Epidemiology of Neuroendocrine Tumours)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Neuroendocrine Cancer. According to news originating from Oxford, United Kingdom, by NewsRx correspondents, research stated, "The reviewing and assessment of epidemiological characteristics of neuroendocrine tumours (NETs) remains a challenge. Despite the fact that it is an uncommon family of neoplasms, several worldwide series have revealed an increasing incidence of this rare condition."

Our news journalists obtained a quote from the research from the University of Oxford, "However, the data are difficult to compare over time due to changes in classification. We compared the data related to incidence, prevalence, stage of the disease at diagnosis and survival reported in several series, focusing on the differences and trying to examine some of the probable reasons that may explain the variations in the results between studies. The incidence of NETs is increasing over time, and their incidental discovery due to improved and more frequent imaging does not seem to be enough to explain this rise. Significant differences can be found between geographic regions and races, suggesting that environmental or genetic factors may contribute to the clinical and biological behaviour of these tumours; increasing our knowledge of oncogenesis will be necessary to explain them."

According to the news editors, the research concluded: "As with other rare diseases, creating specific databases and multidisciplinary working groups would improve the accuracy of the information gained."

The news correspondents report that additional information may be obtained from I. Huguet, Dept. of Endocrinology, Oxford Centre for Diabetes, Endocrinology and Metabolism, University of Oxford, Oxford, UK. Additional authors for this research include A.B. Grossman and D. O'Toole.

Membrane Proteins - G-Protein-Coupled Receptors

Studies from University of Paris Yield New Information about G-Protein-Coupled Receptors (STR-324, a Stable Analog of Opiorphin, Causes Analgesia in Postoperative Pain by Activating Endogenous Opioid Receptor-dependent Pathways)

Our news journalists obtained a quote from the research from the University of Paris, "However, the data are difficult to compare over time due to changes in classification. We compared the data related to incidence, prevalence, stage of the disease at diagnosis and survival reported in several series, focusing on the differences and trying to examine some of the probable reasons that may explain the variations in the results between studies. The incidence of NETs is increasing over time, and their incidental discovery due to improved and more frequent imaging does not seem to be enough to explain this rise. Significant differences can be found between geographic regions and races, suggesting that environmental or genetic factors may contribute to the clinical and biological behaviour of these tumours; increasing our knowledge of oncogenesis will be necessary to explain them."

According to the news editors, the research concluded: "As with other rare diseases, creating specific databases and multidisciplinary working groups would improve the accuracy of the information gained."

According to news reporting from Le Kremlin Bicetre, France, by NewsRx journalists, research stated, "Opiorphin is a naturally occurring potent analgesic human peptide. It protects enkephalins from degradation and inhibits pain perception in various acute pain models via activation of endogenous opioid pathways."

The news correspondents obtained a quote from the research from the University of Paris, "However, the efficacy of opiorphin continuous infusion and its chemically stable form, STR-324, in postoperative pain is unknown. Using the Brennan model of plantar incision-induced hypersensitivity, the authors examined the postsurgical analgesic response to mechanical and thermal stimuli of 7-day continuously intravenously infused drugs (8 to 10 rats per group). Antinociception from opiorphin with reference to morphine and STR-324 was assessed. Spinal c-Fos expression and the involvement of opioid receptor-dependent pathways were investigated. The occurrence of respiratory and hemodynamic adverse effects of opiorphin was also tested. Intravenous infusion of opiorphin significantly reduced responses to mechanical stimuli from days 1 to 4 post surgical period at 143 to 175-kPa mean ranges compared with 23 to 30-kPa mean ranges for vehicle (P < 0.05). During the 3-day postoperative period, no respiratory rate, oxygen saturation, arterial pressure, or heart rate adverse effects were induced by opiorphin. STR-324 consistently inhibited mechanical and thermal hyperalgesia with similar potency as that of opiorphin. Mechanistic analyses demonstrated that the STR-324 antinociceptive effect was reversed by the opioid antagonist, naloxone. Also, STR-324 significantly reduced the number of pain-evoked spinal cFos-immunoreactive nuclei. Intravenous infusion of opiorphin and STR-324 produced significant antinociceptive effect in a postoperative pain model. This study demonstrates that STR-324 is effective in postoperative pain management due to its strong antihyperalgesic effects mediated via opioid-dependent antinociceptive pathways."

According to the news reporters, the research concluded: "Opiorphin analog should represent a new class of potent and safe analgesics."

For more information on this research see: STR-324, a Stable Analog of Opiorphin, Causes Analgesia in Postoperative Pain by Activating Endogenous Opioid Receptor-dependent Pathways. *Anesthesiology*. 2016;125(5):1017-1029. *Anesthesiology* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Oncology - Germ Cell Cancer

Studies from University of Paris-Sud Add New Findings in the Area of Germ Cell Cancer (Predicting and preventing thromboembolic events in patients receiving cisplatin-based chemotherapy for germ cell tumours)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Germ Cell Cancer are presented in a new report. According to news reporting from Villejuif, France, by NewsRx journalists, research stated, "Patients with germ cell tumours (GCT) receiving cisplatin-based chemotherapy are at high risk of thromboembolic events (TEE). Previously, we identified serum lactate dehydrogenase (LDH) and body surface area (BSA) as independent predictive factors for TEE."

The news correspondents obtained a quote from the research from the University of Paris-Sud, "The aim of this study was to validate these predictive factors and to assess the impact of thromboembolism prophylaxis in patients at risk of deep venous thrombosis (DVT). Between 2001 and 2014, 295 patients received first-line cisplatin-based chemotherapy for GCT. Preventive anticoagulation with low-molecular-weight heparin (LMWH) was progressively implemented in patients with predictive factors. Sixteen patients with evidence of TEE before starting chemotherapy were excluded from the analysis. Among 279 eligible patients, a TEE occurred in 38 (14%) consisting of DVT (n = 26), arterial thrombosis (n = 2), and superficial thrombophlebitis (n = 10). DVT occurred in 26 (12.7%) of 204 patients with risk factors versus two (2.6%) of 75 patients with no risk factors (p = 0.01). After a prevention protocol was progressively implemented from 2005, primary thromboprophylaxis was administered to 104 patients (68%) with risk factors. Among patients at risk (n = 151), the incidence of DVT decreased by roughly half when they received a LMWH: 9/97 (9.2%) and 9/54 (16.6%), respectively (p = 0.23). Patients with GCT who receive cisplatin-based chemotherapy are at risk of developing a TEE which can be predicted by elevated serum LDH. To our knowledge this is the first study exploring LMWH as thromboprophylaxis in GCT patients."

According to the news reporters, the research concluded: "A prospective trial testing prophylactic anticoagulation is warranted."

Studies from University of Pavia Have Provided New Information about Arrhythmogenic Right Ventricular Cardiomyopathy Clinical Course and Predictors of Arrhythmic Risk

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Arrhythmogenic Right Ventricular Dysplasia. According to news reporting originating in Pavia, Italy, by NewsRx journalists, research stated, "Arrhythmogenic right ventricular cardiomyopathy (ARVC) is a leading cause of sudden cardiac death, but its progression over time and predictors of arrhythmias are still being defined. This study sought to describe the clinical course of ARVC and occurrence of life-threatening arrhythmic events (LAE) and cardiovascular mortality; identify risk factors associated with increased LAE risk; and define the response to therapy."

The news reporters obtained a quote from the research from the University of Pavia, "We determined the clinical course of 301 consecutive patients with ARVC using the Kaplan-Meier method adjusted to avoid the bias of delayed entry. Predictors of LAE over 5.8 years of follow-up were determined with Cox multivariable analysis. Treatment efficacy was assessed comparing LAE rates during matched time intervals. A first LAE occurred in 1.5 per 100 person-years between birth and age 20 years, in 4.0 per 100 person-years between ages 21 and 40 years, and in 2.4 per 100 person-years between ages 41 and 60 years. Cumulative probability of a first LAE at follow-up was 14% at 5 years, 23% at 10 years, and 30% at 15 years. Higher risk of LAE was predicted by atrial fibrillation (hazard ratio [HR]: 4.38; p = 0.002), syncope (HR: 3.36; p < 0.001), participation in strenuous exercise after the diagnosis (HR: 2.98; p = 0.028), hemodynamically tolerated sustained monomorphic ventricular tachycardia (HR: 2.19; p = 0.023), and male sex (HR: 2.49; p = 0.012). No difference was observed in the occurrence of LAE before and after treatment with amiodarone, beta-blockers, sotalol, or ablation. A total of 81 patients received an implantable cardioverter-defibrillator, 34 were successfully defibrillated. The high risk of life-threatening arrhythmias in patients with ARVC spans from adolescence to advanced age, reaching its peak between ages 21 and 40 years. Atrial fibrillation, syncope, participation in strenuous exercise after the diagnosis of ARVC, hemodynamically tolerated sustained monomorphic ventricular tachycardia, and male sex predicted lethal arrhythmias at follow-up."

According to the news reporters, the research concluded: "The lack of efficacy of antiarrhythmic therapy and the life-saving role of the implantable cardioverter-defibrillator highlight the importance of risk stratification for patient management."

For more information on this research see: Arrhythmogenic Right Ventricular Cardiomyopathy Clinical Course and Predictors of Arrhythmic Risk. Journal of the American College of Cardiology, 2016;68(23):2540-2550. Journal of the American College of Cardiology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY
Studies from University of Pennsylvania in the Area of Barrett Esophagus Reported (Is Obesity Associated with Barrett's Esophagus and Esophageal Adenocarcinoma?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Digestive System Diseases and Conditions - Barrett Esophagus. According to news reporting from Philadelphia, Pennsylvania, by NewsRx editors, the research stated, "Barrett's esophagus is a premalignant condition portending increased risk of esophageal adenocarcinoma. Given the significant morbidity and mortality of esophageal adenocarcinoma, identification of risk factors for Barrett's esophagus and esophageal adenocarcinoma is crucial."

The news correspondents obtained a quote from the research from the University of Pennsylvania. "There are a plethora of studies investigating the relationship of obesity with these pathologies. Recent studies reveal that this relationship may specifically be with central adiposity. Increased cell turnover and eventual carcinogenesis is likely precipitated by increased intragastric pressure but also is affected by the complex interplay of increased insulin resistance in patients with increased fat tissue."

According to the news reporters, the research concluded: "Further studies are warranted to evaluate if weight loss can decrease progression of Barrett's esophagus."

Our news journalists report that additional information may be obtained by contacting K.L. Lynch, Univ Penn Hlth Syst, Dept. of Internal Med, Div Gastroenterol & Hepatol, Philadelphia, PA 19104, United States.
Studies from University of Pretoria Yield New Information about Type 2 Diabetes (Metformin and Vitamin B12 Deficiency: Where Do We Stand?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is now available. According to news reporting out of Pretoria, South Africa, by NewsRx editors, the research stated, "The association between metformin use and low vitamin B12 levels in type 2 diabetes mellitus patients is well-established. However, many aspects of the topic remain to be elucidated."

Our news journalists obtained a quote from the research from the University of Pretoria, "There is still controversy on the current diagnostic approaches to vitamin B12 deficiency. It is now believed that measuring the serum levels of the vitamin may not reflect its metabolic status. Moreover, there were conflicting results from studies attempting to quantify and explore metformin-associated vitamin B12 deficiency and its clinical impacts."

According to the news editors, the research concluded: "This article reviews the cellular functions of vitamin B12, the biomarkers utilized to define the vitamin deficiency and metformin-induced vitamin B12 deficiency with an emphasis on its prevalence and clinical impacts."

Our news journalists report that additional information may be obtained by contacting M.A. Ahmed, University of Pretoria, Fac Hlth Sci, Dept. of Pharmacol, Pretoria, South Africa.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.18433/J3PK7P. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Melanoma

Studies from University of Queensland in the Area of Melanoma Described (Heritability of naevus patterns in an adult twin cohort from the Brisbane Twin Registry: a cross-sectional study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Melanoma is now available. According to news reporting originating in Brisbane, Australia, by NewsRx journalists, research stated, "Heritability of naevi counts is widely acknowledged as a potential surveillance parameter for prevention purposes. The contribution of heritability to the changes seen in naevus number and morphology over time and their corresponding dermoscopic characteristics is unknown, but is important to understand in order to account for adequate prevention measures."

Financial support for this research came from National Health and Medical Research Council.

The news reporters obtained a quote from the research from the University of Queensland, "To identify naevus characteristics that are strongly influenced by heritability. This cross-sectional study included 220 individuals [76 monozygotic (MZ), 144 dizygotic (DZ)], recruited from the Brisbane Twin Naevus Study. Participants received full body imaging and dermoscopy of naevi (>= 5 mm in diameter. Dermoscopic type, total naevus count (TNC), change in TNC with age, and naevus distribution, size, colour and profile were compared between MZ and DZ twins. Heritability of these traits was assessed via Falconer's estimate. Significant differences were found in comparing MZ and DZ twins for TNC, numbers of naevi 5?0-7?9 mm in diameter, counts of light-brown naevi, naevi on the back and sun-protected sites, and naevi with the 'nonspecific' dermoscopic pattern. This study strongly supports a heritable component to TNC, as well as changes in TNC, and the number of medium-sized naevi, light-brown naevi, specific sites and certain dermoscopic features in adults."

According to the news reporters, the research concluded: "These characteristics should be taken into account by naevus surveillance programmes and further studied to identify candidate gene associations for clinical and dermoscopic patterns in conjunction with melanoma risk stratification."

Our news correspondents report that additional information may be obtained by contacting S. Lee, Dermatology Research Centre, The University of Queensland, School of Medicine, Translational Research Institute, Brisbane, Australia. Additional authors for this research include D.L. Duffy, P. McClenahan, K.J. Lee, E. McEniery, B. Burke, K. Jagirdar, N.G. Martin, R.A. Sturm, H.P. Soyer and H. Schaider.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/bjd.14291. This DOI is a link to an online electronic document that is either free or for purchase.

Cholesterol

Studies from University of Regensburg Provide New Data on Cholesterol (High-fat diet prevents adaptive peripartum-associated adrenal gland plasticity and anxiolysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cholesterol. According to news reporting originating from Regensburg, Germany, by NewsRx correspondents, research stated, "Maternal obesity is associated with lower basal plasma cortisol levels and increased risk of postpartum psychiatric disorders. Given that both obesity and the peripartum period are characterized by an imbalance between adrenocorticotropic hormone (ACTH) and cortisol, we hypothesized that the adrenal glands undergo peripartum-associated plasticity and that such changes would be prevented by a high-fat diet (HFD)."

Our news editors obtained a quote from the research from the University of Regensburg, "Here, we demonstrate substantial peripartum adrenal gland plasticity in the pathways involved in cholesterol supply for steroidogenesis in female rats. In detail, the receptors involved in plasma lipid uptake, low density lipoprotein (LDL) receptor (LDLR) and scavenger receptor class B type 1 (SRB1), are elevated, intra-adrenal cholesterol stores are depleted, and a key enzyme in de novo cholesterol synthesis, hydroxymethylglutaryl coenzyme A reductase (HMGCR), is downregulated; particularly at mid-lactation. HFD prevented the lactation-associated anxiolysis, basal hypercorticism, and exaggerated the corticosterone response to ACTH. Moreover, we show that HFD prevented the downregulation of adrenal cholesterol stores and HMGCR expression, and LDLR upregulation at mid-lactation."

According to the news editors, the research concluded: "These findings show that the adrenal gland is an important regulator of peripartum-associated HPA axis plasticity and that HFD has maladaptive consequences for the mother, partly by preventing these neuroendocrine and also behavioural changes."

For more information on this research see: High-fat diet prevents adaptive peripartum-associated adrenal gland plasticity and anxiolysis. Scientific Reports, 2015;5 ():14821. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting C.V. Perani, Dept. of Behavioural and Molecular Neurobiology, University of Regensburg, Regensburg, Germany. Additional authors for this research include I.D. Neumann, S.O. Reber and D.A Slattery.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/srep14821. This DOI is a link to an online electronic document that is either free or for purchase.

Eye Diseases and Conditions - Choroidal...

Studies from University of Regensburg Yield New Data on Choroidal Neovascularization (Epithelial-mesenchymal transition of the retinal pigment epithelium causes choriocapillaris atrophy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Eye Diseases and Conditions - Choroidal Neovascularization is now available. According to news reporting originating from Regensburg, Germany, by NewsRx correspondents, research stated, "Epithelial-to-mesenchymal transition (EMT) of the retinal pigment epithelium (RPE) is commonly observed at sites of choroidal neovascularization in patients suffering from age-related macular degeneration. To learn in an experimental model how RPE EMT affects the biology of the choroidal vasculature, we studied transgenic mice (beta B1-TGF-beta 1) with ocular overexpression of transforming growth factor-beta 1 (TGF-beta 1)."

Our news editors obtained a quote from the research from the University of Regensburg, "RPE EMT was detectable at postnatal day (P)1 and included marked structural and functional alterations such as loss of the outer blood-retina barrier and reduced mRNA expression of the RPE-characteristic molecules Rlbp1, Rpe65, Rbp1 and Vegfa. Moreover, vascular endothelial growth factor (VEGF) was not detectable by immunohistochemistry at the RPE/choroid interface, while RPE cells stained intensely for alpha-smooth muscle actin. The choriocapillaris, the characteristic choroidal capillary network adjacent to the RPE, developed normally and was not obviously changed in embryonic transgenic eyes but was absent at P1 indicating its atrophy. At around the same time, photoreceptors stopped to differentiate and photoreceptor apoptosis was abundant in the second week of life. Structural changes were also seen in the retinal vasculature of transgenic animals, which did not form intraretinal vessels, and the hyaloid vasculature, which did not regress. In addition, the amounts of retinal HIF-1 alpha and its mRNA were markedly reduced. We conclude that high amounts of active TGF-beta 1 in the mouse eye cause transdifferentiation of the RPE to a mesenchymal phenotype. The loss of epithelial differentiation leads to the diminished synthesis of RPE-characteristic molecules including that of VEGF. Lack of RPE-derived VEGF causes atrophy of the choriocapillaris, a scenario that disrupts photoreceptor differentiation and finally results in photoreceptor apoptosis. Lack of retinal vessel formation and of hyaloid vessel regression might be caused by the decrease in the metabolic requirements of the neuroretina leading to low amounts of retinal HIF-1 alpha. In summary, our data indicate that failure of RPE differentiation may well precede and cause atrophy of the choriocapillaris."

According to the news editors, the research concluded: "In contrast, RPE EMT is not sufficient to cause choroidal neovascularization."

The news editors report that additional information may be obtained by contacting E.R. Tamm, University of Regensburg, Inst Human Anat & Embryol, D-93053 Regensburg, Germany. Additional authors for this research include M. Scholz, M. Koch and E.R. Tamm.

Keywords for this news article include: Regensburg, Germany, Europe, Intercellular Signaling Peptides and Proteins, Vascular Endothelial Growth Factors, Receptor Protein-
Studies from University of Rennes in the Area of Holoprosencephaly Described (Mutational Spectrum in Holoprosencephaly Shows That FGF is a New Major Signaling Pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Holoprosencephaly. According to news reporting originating from Rennes, France, by NewsRx correspondents, research stated, "Holoprosencephaly (HPE) is the most common congenital cerebral malformation in humans, characterized by impaired forebrain cleavage and midline facial anomalies. It presents a high heterogeneity, both in clinics and genetics."

Our news editors obtained a quote from the research from the University of Rennes, "We have developed a novel targeted next-generation sequencing (NGS) assay and screened a cohort of 257 HPE patients. Mutations with high confidence in their deleterious effect were identified in approximately 24% of the cases and were held for diagnosis, whereas variants of uncertain significance were identified in 10% of cases. This study provides a new classification of genes that are involved in HPE. SHH, ZIC2, and SIX3 remain the top genes in term of frequency with GLI2, and are followed by FGF8 and FGFR1. The three minor HPE genes identified by our study are DLL1, DISP1, and SUFU. Here, we demonstrate that fibroblast growth factor signaling must now be considered a major pathway involved in HPE. Interestingly, several cases of double mutations were found and argue for a polygenic inheritance of HPE."

According to the news editors, the research concluded: "Altogether, it supports that the implementation of NGS in HPE diagnosis is required to improve genetic counseling."

Keywords for this news article include: Rennes, France, Europe, Central Nervous System Diseases and Conditions, Genetics, Intercellular Signaling Peptides and Proteins, Craniofacial Diseases and Conditions, Musculoskeletal Abnormalities, Nervous System Malformations, Craniofacial Abnormalities, Fibroblast Growth Factors, Congenital
Oncology - Cancer Risk

Studies from University of Rhode Island in the Area of Cancer Risk Described (Polycyclic Aromatic Hydrocarbon Contamination in Soils of San Mateo Ixtatan, Guatemala: Occurrence, Sources, and Health Risk Assessment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Cancer Risk. According to news reporting out of Kingston, Rhode Island, by NewsRx editors, research stated, "Exposure to high concentrations of carcinogenic pollutants in soils and sediments can result in increased health risks. Determining the levels and sources of contamination in developing communities is important for helping to reduce pollution and mitigate the risk of exposure."

Our news journalists obtained a quote from the research from the University of Rhode Island, "In the Mayan community of San Mateo Ixtatan, Guatemala, 24 samples of topsoil from urban, peri-urban, and agricultural sites and six samples of river sediment were collected and analyzed for 17 polycyclic aromatic hydrocarbons (PAHs). The sum of the concentrations of these PAHs at the urban and periurban sites ranged from 460 to 3251 mg kg\(^{-1}\) (mean, 1401 mg kg\(^{-1}\)), whereas at agricultural sites the range was 350 to 2087 mg kg\(^{-1}\) (mean, 1038 mg kg\(^{-1}\)). Analysis to identify and apportion the source showed that the PAHs emitted from wood stoves contributed 71 and 76% of the total PAHs in urban and agricultural areas soils, respectively. The calculated incremental lifetime cancer risk due to the ingestion of soil, dermal contact, and dietary intake through corn consumption was greater than the acceptable level of 10\(^{-6}\) established by the USEPA. Our findings suggest that the residents of rural communities can be at increased cancer risk despite little or no industrial activity in the local area."

According to the news editors, the research concluded: "Alternate domestic fuel sources should be considered to reduce the health risk in local communities."

For more information on this research see: Polycyclic Aromatic Hydrocarbon Contamination in Soils of San Mateo Ixtatan, Guatemala: Occurrence, Sources, and Health Risk Assessment. *Journal of Environmental Quality*, 2016;45(5):1635-1643. *Journal of Environmental Quality* can be contacted at: Amer Soc Agronomy, 677 S Segoe Rd, Madison, WI 53711, USA.

Autoimmune Diseases and Conditions - Multiple...

Studies from University of Rostock Have Provided New Information about Multiple Sclerosis (Disease-modifying therapies and infectious risks in multiple sclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Autoimmune Diseases and Conditions - Multiple Sclerosis have been presented. According to news reporting out of Rostock, Germany, by NewsRx editors, research stated, "Immunomodulatory and immunosuppressive treatments for multiple sclerosis (MS) are associated with an increased risk of infection, which makes treatment of this condition challenging in daily clinical practice. Use of the expanding range of available drugs to treat MS requires extensive knowledge of treatment-associated infections, risk-minimizing strategies and approaches to monitoring and treatment of such adverse events."

Our news journalists obtained a quote from the research from the University of Rostock, "An interdisciplinary approach to evaluate the infectious events associated with available MS treatments has become increasingly relevant. In addition, individual stratification of treatment-related infectious risks is necessary when choosing therapies for patients with MS, as well as during and after therapy. Determination of the individual risk of infection following serial administration of different immunotherapies is also crucial."

According to the news editors, the research concluded: "Here, we review the modes of action of the available MS drugs, and relate this information to the current knowledge of drug-specific infectious risks and risk-minimizing strategies."

Our news journalists report that additional information may be obtained by contacting A. Winkelmann, Dept. of Neurology, University of Rostock, Gehlsheimer Strasse 20, 18147 Rostock, Germany. Additional authors for this research include M. Loebermann, E.C. Reisinger, H.P. Hartung and U.K Zettl.

Studies from University of Sao Paulo Have Provided New Data on Cell Endocrinology (Brain STAT5 signaling and behavioral control)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Life Science Research - Cell Endocrinology are presented in a new report. According to news reporting originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "Several growth factors and cytokines recruit the signal transducer and activator of transcription 5 (STAT5) signaling pathway to control cell proliferation, differentiation and apoptosis. Nonetheless, the importance of this transcription factor for brain functions is still poorly understood."

Financial support for this research came from Sao Paulo Research Foundation.

Our news editors obtained a quote from the research from the University of Sao Paulo, "Because some STAT5-inducing hormones, such as prolactin and leptin, act in the brain to regulate the expression of motivated behaviors, this signaling pathway is likely involved in behavioral modulation. Therefore, the objective of the present review was to summarize and discuss the available data regarding the possible role of central STAT5 signaling in the regulation of brain functions, especially on behavioral control. We discussed studies that investigated the importance of STAT5 signaling in the regulation of maternal and feeding behaviors. Additionally, we highlighted other behaviors that could be potentially affected by STATS signaling."

According to the news editors, the research concluded: "This knowledge may help to understand how motivated behaviors are regulated at the cellular level."

For more information on this research see: Brain STAT5 signaling and behavioral control. Molecular and Cellular Endocrinology, 2016;438(C):70-76. Molecular and Cellular Endocrinology can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Studies from University of Sao Paulo Have Provided New Information about Nephrolithotomy (Percutaneous Nephrolithotomy in Immunocompromised Patients: Outcomes from a Matched Case-Control Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Surgery - Nephrolithotomy. According to news originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "To compare the outcomes of percutaneous nephrolithotomy (PCNL) in immunocompromised patients with those of PCNL in healthy population. A matched case-control study was performed from January 2009 through December 2014 using our prospectively collected kidney stone database."

Our news journalists obtained a quote from the research from the University of Sao Paulo, "Patients with positive serology to human immunodeficiency virus (HIV), hepatitis C (cellular immune dysfunction), and patients on high dose of immunosuppressive drugs for treatment of autoimmune diseases composed the case group. Control group included patients with kidney stones and no other comorbidity. Patients were randomly matched based on Guy's score as a surrogate of case complexity. Sixty-two patients were enrolled in this study, 21 cases and 42 controls. There were no significant differences in age, gender, and body mass index between groups. Regarding PCNL technique, there were no differences in patient positioning, number of accesses, and operative time. Complication rate was higher in the case group (38.1% vs 14.3%; p = 0.032); however, major complications, defined by Clavien score >= 3, were not statistically different (4.8% vs 2.4%; p = 0.611). There was a tendency of more postoperative urinary tract infection in the case group (19% vs 4.8%; p = 0.069). Mean decrease in hemoglobin level (3.3 vs 2.4 mg/dL; p = 0.037) and blood transfusion rate (23.8% vs 4.8%; p = 0.036) was significantly higher in the case group. Immunocompromised patients had a 2.8-fold increased risk of complications (odds ratio [OR] = 2.0, 95% confidence interval [CI] 1.01, 7.74) and a 5.8-fold increased risk of blood transfusion (OR = 5.8, 95% CI 1.29, 26.55). There were no differences in stone-free rate, nephrostomy tube time, and length of hospital stay."

According to the news editors, the research concluded: "Immunocompromised patients are at higher risk for complications such as bleeding after PCNL."

The news correspondents report that additional information may be obtained from F.C.M. Torricelli, University of Sao Paulo, Sch Med, Dept. of Surg, Div Urol, Sao Paulo, Brazil. Additional authors for this research include M. Monga, V. Dall'Aqua, G.S. Marchini, F.C. Vicentini, A. Danilovic, M. Srougi and E. Mazzucchelli.

Gram-Negative Bacteria - Escherichia coli

Studies from University of Sao Paulo Reveal New Findings on Escherichia coli (First Report of the Globally Disseminated IncX4 Plasmid Carrying the mcr-1 Gene in a Colistin-Resistant Escherichia coli Sequence Type 101 Isolate from a Human ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Gram-Negative Bacteria - Escherichia coli. According to news reporting originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "A colistin-resistant Escherichia coli strain was recovered from a patient with a diabetic foot infection in Brazil."

Our news editors obtained a quote from the research from the University of Sao Paulo, "Whole-genome analysis revealed that the E. coli isolate belonged to the widespread sequence type (ST) 101 and harbored the mcr-1 gene on an IncX4 plasmid that was highly similar to mcr-1-bearing IncX4 plasmids that were recently identified in Enterobacteriaceae from food, animal, and human samples recovered on different continents."

According to the news editors, the research concluded: "These results suggest that self-transmissible IncX4-type plasmids may represent promiscuous plasmids contributing to the intercontinental spread of the mcr-1 gene."

The news editors report that additional information may be obtained by contacting M.R. Fernandes, University of Sao Paulo, Fac Pharmaceut Sci, Dept. of Clin Anal, Sao Paulo, Brazil. Additional authors for this research include J.A. McCulloch, M.A. Vianello, Q. Moura, P.J. Perez-Chaparro, F. Esposito, L. Sartori, M. Dropa, M.H. Matte, D.P.A. Lira, E.M. Mamizuka and N. Lincopan.

Oncology - Liver Cancer

Studies from University of Science and Technology Update Current Data on Liver Cancer (Artemin is hypoxia responsive and promotes oncogenicity and increased tumor initiating capacity in hepatocellular carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Liver Cancer are discussed in a new report. According to news originating from Hefei, People's Republic of China, by NewsRx correspondents, research stated, "Hypoxia has been reported to regulate the cancer stem cell (CSC) population yet the underlying mechanism is poorly characterized. Herein, we show that Artemin (ARTN), a member of the glial cell derived neurotrophic factor family of ligands, is a hypoxia-responsive factor and is essential for hypoxia-induced CSC expansion in hepatocellular carcinoma (HCC)."

Our news journalists obtained a quote from the research from the University of Science and Technology, "Clinically, elevated expression of ARTN in HCC was associated with larger tumor size, faster relapse and shorter survival. In vitro, HCC cells with forced expression of ARTN exhibited reduced apoptosis, increased proliferation, epithelial-mesenchymal transition (EMT) and enhanced motility. Additionally, ARTN dramatically increased xenograft tumor size and metastasis in vivo. Moreover, ARTN also enhanced tumorsphere formation and the tumor initiating capacity of HCC cells, consequent to expansion of the CD133+ CSC population. ARTN transcription was directly activated by hypoxia-induced factor-1a (HIF-1a) and hypoxia induced ARTN promoted EMT and increased the CSC population via AKT signaling."

According to the news editors, the research concluded: "We herein identify a novel HIF-1a/ARTN axis promoting CSC-like behavior in hypoxic environments which implicates ARTN as a valuable therapeutic target for HCC."

For more information on this research see: Artemin is hypoxia responsive and promotes oncogenicity and increased tumor initiating capacity in hepatocellular carcinoma. *Oncotarget*, 2016;7(3):3267-82.

The news correspondents report that additional information may be obtained from M. Zhang, The CAS Key Laboratory of Innate Immunity and Chronic Disease, School of Life Sciences and Medical Center, University of Science and Technology of China, Hefei, People's Republic of China. Oncology - Colon Cancer

Studies from University of Shandong Reveal New Findings on Colon Cancer (Protein-protein interaction networks and modules analysis for colorectal cancer and serrated adenocarcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Colon Cancer have been published. According to news reporting from Jinan, People's Republic of China, by NewsRx journalists, research stated, "To screen key modules and explore the potential mechanism of conventional colorectal cancer (CRC) and colorectal serrated adenocarcinoma (SAC). The microarray data of GSE36758 and GSE8671 were downloaded from Gene Expression Omnibus database."

The news correspondents obtained a quote from the research from the University of Shandong, "The differentially expressed genes (DEGs) in SAC versus colon carcinoma (CC) and CC versus normal control (NC) group were analyzed and the protein-protein interaction (PPI) networks for DEGs were constructed. The modules of PPI networks were further analyzed and the function enrichment analysis of all enrolled DEGs was carried out based on ToppGene database. Total eight DEGs (SAC vs. CC) and 445 DEGs (CC vs. NC) were extracted based on the gene expression profile of GSE36758 and GSE8671, respectively. Total three PPI networks were constructed with DEGs in CC versus NC, SAC versus CC group, and DEGs in both two groups. Three modules were extracted from the PPI network of CC versus NC. Meanwhile, three modules were extracted from the network of DEGs in both two groups. Function enrichment analysis showed that DEGs involved in these modules were mainly associated with cellular activities. DEGs in modules of SAC and CRC were mainly involved in cellular activities pathways."

According to the news reporters, the research concluded: "The PPI networks and modules might contribute to the further study of pathogenesis for CRC and SAC based on the molecular level."

Our news journalists report that additional information may be obtained by contacting J. Wang, Dept. of Anorectal Surgery, The Second Hospital of Shandong University, Jinan, Shandong Province 250033, People's Republic of China. Additional authors for this research include L. Ye, J. Wang, L. Jin, Y. Lv and M. Yu.

Studies from University of Shizuoka Add New Findings in the Area of Cancer Therapy (The use of surfactants to enhance the solubility and stability of the water-insoluble anticancer drug SN38 into liquid crystalline phase nanoparticles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Cancer Therapy have been published. According to news reporting from Shizuoka, Japan, by NewsRx journalists, research stated, "Cubosomes were used to increase the aqueous solubility of the water insoluble anticancer drug SN38. The results showed that the use of a common cubosome formulation consisting of phytantriol (PHYT) as the matrix amphiphile (PHYT-cubosome) led to a 6-fold increase in the solubility of SN38."

The news correspondents obtained a quote from the research from the University of Shizuoka, "However, mean hydrodynamic diameter (D-H) and polydispersity index (PDI) of these PHYT-cubosome particles were 345 +/- 49 nm and 0.37 +/- 0.05, respectively, making them unsuitable for intravenous applications. Several additives were investigated to increase the solubility of SN38 and reduce the DH and PDI values of the resulting particles. Charged additives such as didodecyldimethyl ammonium bromide (DDAB) and sodium dodecyl sulfate (SDS) led to improvements in the physicochemical properties of the cubosomes. Notably, the PHYT-DDAB and PHT-SDS cubosomes led to 15- and 14-fold increases in the aqueous solubility of SN38, respectively. Moreover, the SN38 loaded into the PHYT-DDAB and PHYT-SDS cubosomes was found to be highly stable, with very little hydrolysis to its inactive acid form."

According to the news reporters, the research concluded: "In summary, the addition of DDAB and SDS to PHYT-cubosome nanoparticle drug delivery systems not only led to considerable improvements in their physicochemical properties, but also enhanced the aqueous solubility of SN38 and increased its chemical stability."

Our news journalists report that additional information may be obtained by contacting S. Itai, University of Shizuoka, Sch Pharmaceut Sci, Dept. of Pharmaceut Engn, Suruga Ku, Shizuoka 4228526, Japan. Additional authors for this research include Y. Iwao, S. Noguchi, T. Oka and S. Itai.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.10.058. This DOI is a link to an online electronic document that is either free or for purchase.

Studies from University of Shizuoka Have Provided New Data on Pharmaceutical Research (Oral sustained-release suspension based on a lauryl sulfate salt/complex)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Pharmaceutical Research. According to news reporting out of Shizuoka, Japan, by NewsRx editors, research stated, "The objective of this study was to evaluate the feasibility of lauryl sulfate (LS) salt/complex as a novel carrier in oral sustained-release suspensions. Mirabegron, which has a pH-dependent solubility, was selected as the model drug."

Our news journalists obtained a quote from the research from the University of Shizuoka, "Sodium lauryl sulfate (SLS) was bound to mirabegron in a stoichiometric manner to form an LS salt/complex. LS salt/complex formulation significantly reduced the solubility of mirabegron and helped mirabegron achieve sustained-release over a wide range of pH conditions. Microparticles containing the LS salt/complex were prepared by spray drying with the aqueous dispersion of ethylcellulose (Aquacoat ® ECD). The diameter of the microparticles was less than 200 μm, which will help avoid a gritty taste. In vitro results indicated the microparticles had slower dissolution profiles than the LS salt/complex. The dissolution rate could be controlled flexibly by changing the amount of Aquacoat ® ECD. The microparticle suspension retained the desired sustained-release property and dissolution profile after being stored for 30 days at 40 degrees C. In addition, the suspension displayed sustained-release behavior in dogs without a pronounced C-max peak, which will help prevent side effects."

According to the news editors, the research concluded: "These results suggest that microparticles containing LS salt/complex may be useful as a novel sustained-release suspension for oral delivery."

Our news journalists report that additional information may be obtained by contacting N. Namiki, University of Shizuoka, Sch Pharmaceut Sci, Dept. of Pharm Practice & Sci, Suruga Ku, Shizuoka 4228526, Japan. Additional authors for this research include S. Uchida, K. Yoshihara, T. Yasuji, K. Sako and N. Namiki.

Studies from University of Southampton Provide New Data on Pharmacoepidemiology and Drug Safety (Comparability of the age and sex distribution of the UK Clinical Practice Research Datalink and the total Dutch population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Pharmacoepidemiology and Drug Safety have been presented. According to news reporting originating in Southampton, United Kingdom, by NewsRx journalists, research stated, "The UK Clinical Practice Research Datalink (CPRD) is increasingly being used by Dutch researchers in epidemiology and pharmacoepidemiology. It is however unclear if the UK CPRD is representative of the Dutch population and whether study results would apply to the Dutch population."

The news reporters obtained a quote from the research from the University of Southampton, "Therefore, as first step, our objective was to compare the age and sex distribution of the CPRD with the total Dutch population. As a measure of representativeness, the age and sex distribution of the UK CPRD were visually and numerically compared with Dutch census data from the StatLine database of the Dutch National Bureau of Statistics in 2011. The age distribution of men and women in the CPRD population was comparable to the Dutch male and female population. Differences of more than 10% only occurred in older age categories (75+ in men and 80+ in women). Results from observational studies that have used CPRD data are applicable to the Dutch population, and a useful resource for decision making in the Netherlands."

According to the news reporters, the research concluded: "Nevertheless, differences in drug exposure likelihood between countries should be kept in mind, as these could still cause variations in the actual population studied, thereby decreasing its generalizability."

Our news correspondents report that additional information may be obtained by contacting F. de Vries, University of Southampton, MRC Life Course Epidemiol Unit, Southampton, Hants, United Kingdom. Additional authors for this research include A.M. Gallagher, E. Herrett, A.A.M. Masclee, M.L.G. Janssen-Heijnen and F. de Vries.

Cardiovascular Diseases

Studies from University of Southern Florida Yield New Data on Cardiovascular Diseases (Pregnancy as a window to future health: maternal placental syndromes and short-term cardiovascular outcomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases have been presented. According to news originating from Tampa, Florida, by NewsRx correspondents, research stated, "Cardiovascular disease is the leading cause of death among women. Identifying risk factors for future cardiovascular disease may lead to earlier lifestyle modifications and disease prevention."

Our news journalists obtained a quote from the research from the University of Southern Florida, "Additionally, interpregnancy development of cardiovascular disease can lead to increased perinatal morbidity in subsequent pregnancies. Identification and implementation of interventions in the short term (within 5 years of first pregnancy) may decrease morbidity in subsequent pregnancies. We identified the short-term risk (within 5 years of first pregnancy) of cardiovascular disease among women who experienced a maternal placental syndrome, as well as preterm birth and/or delivered a small-for-gestational-age infant. We conducted a retrospective cohort study using a population-based, clinically enhanced database of women in the state of Florida. Nulliparous women and girls aged 15-49 years experiencing their first delivery during the study time period with no prepregnancy history of diabetes mellitus, hypertension, or heart or renal disease were included in the study. The risk of subsequent cardiovascular disease was compared among women who did and did not experience a placental syndrome during their first pregnancy. Risk was then reassessed among women with placental syndrome and preterm birth or delivering a small-for-gestational-age infant vs those without these adverse pregnancy outcomes. The final study population was 302,686 women and girls. Median follow-up time for each patient was 4.9 years. The unadjusted rate of subsequent cardiovascular disease among women and girls with any placental syndrome (11.8 per 1000 women) was 39% higher than the rate among women and girls without a placental syndrome (8.5 per 1000 women). Even after adjusting for sociodemographic factors, preexisting conditions, and clinical and behavioral conditions associated with the current pregnancy, women and girls with any placental syndrome experienced a 19% increased risk of cardiovascular disease (hazard ratio, 1.19; 95% confidence interval, 1.07-1.32). Women and girls with > 1 placental syndrome had the highest cardiovascular disease risk (hazard ratio, 1.43; 95% confidence interval, 1.20-1.70), followed by those with eclampsia/preeclampsia alone (hazard ratio, 1.42; 95% confidence interval, 1.14-1.76). When placental syndrome was combined with preterm birth and/or small for gestational age, the adjusted risk of cardiovascular disease increased 45% (95% confidence interval, 1.24-1.71). Women and girls with placental syndrome who then developed cardiovascular disease experienced a 5-fold increase in health care-related costs during follow-up, compared to those who did not develop cardiovascular disease. Women and girls experiencing placental syndromes and preterm birth or small-for-gestational-age infant are at increased risk of subsequent cardiovascular disease in short-term follow-up."

According to the news editors, the research concluded: "Strategies to identify and improve cardiovascular disease risk in the postpartum period may improve future heart disease outcomes."

For more information on this research see: Pregnancy as a window to future health: maternal placental syndromes and short-term cardiovascular outcomes. American Journal of
Studies from University of Strathclyde Add New Findings in the Area of Heart Disease (Daily milk consumption and all-cause mortality, coronary heart disease and stroke: a systematic review and meta-analysis of observational cohort studies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Disease have been published. According to news reporting out of Ecully, France, by NewsRx editors, research stated, "Observational studies and meta-analyses relating milk consumption by adults to all-cause mortality, coronary heart disease and stroke have obtained contradictory results. Some studies found a protective effect of milk consumption, whilst other found an increased risk."

Our news journalists obtained a quote from the research from the University of Strathclyde, "We performed a systematic literature search until June 2015 on prospective studies that looked at milk consumption, all-cause mortality, coronary heart disease and stroke. Random-effect meta-analyses were performed with dose-response. Twenty-one studies involving 19 cohorts were included in this meta-analysis, 11 on all-cause mortality, 9 on coronary heart disease, and 10 on stroke. Milk intake ranged from 0 to 850 mL/d. The summary relative risk (SRR) for 200 mL/d milk consumption was 1.01 (95% CI: 0.96-1.06) for all-cause mortality, 1.01 (95% CI: 0.98-1.05) for fatal and non-fatal coronary heart disease, and 0.91 (95% CI: 0.82-1.02) for fatal and non fatal stroke. Stratified analyses by age, Body Mass Index, total energy intake and physical activity did not alter the SRR estimates. The possibility of publication bias was found for all cause mortality and for stroke, indicating a gap in data that could have suggested a higher risk of these conditions with increased milk consumption. We found no evidence for a decreased or increased risk of all-cause mortality, coronary heart disease, and stroke associated with adult milk consumption."

According to the news editors, the research concluded: "However, the possibility cannot be dismissed that risks associated with milk consumption could be underestimated because of publication bias."

For more information on this research see: Daily milk consumption and all-cause mortality, coronary heart disease and stroke: a systematic review and meta-analysis of observational cohort studies. BMC Public Health, 2016;16():10-17. BMC Public Health can be

Mouth Disease and Conditions - Cleft Lip and Palate

Studies from University of Sydney Have Provided New Information about Cleft Lip and Palate (Recurrence of Split Hand/Foot Malformation, Cleft Lip/Palate, and Severe Urogenital Abnormalities due to Germline Mosaicism for TP63 Mutation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mouth Disease and Conditions - Cleft Lip and Palate. According to news originating from Sydney, Australia, by NewsRx correspondents, research stated, "We describe two sibling fetuses with urogenital abnormalities detected by prenatal ultrasound, in which post-delivery examination showed split hand and foot malformation, and bilateral cleft lip and palate. These findings are consistent with ectrodactyly-ectodermal dysplasia-cleft lip with or without cleft palate syndrome (EEC)."

Our news journalists obtained a quote from the research from the University of Sydney, "Both fetuses were found to have the same missense mutation in TP63 (c.1051G > A; p.D351N). Parental clinical examinations and lymphocyte DNA analyses were normal. This report illustrates the potential severity of urogenital defects in TP63-related disorders, which may be detectable with fetal ultrasonography."

According to the news editors, the research concluded: "It highlights the need to counsel for the possibility of germline mosaicism in TP63-associated disorders."

The news correspondents report that additional information may be obtained from M. Wilson, University of Sydney, Discipline Genet Med, Sydney, NSW, Australia. Additional authors for this research include M. Krivanek, R. Flottmann, H. Peters and M. Wilson.

Oncology - Cancer Risk

Studies from University of Sydney Provide New Data on Cancer Risk (International survey of awareness of genetic risk in the clinical sarcoma community)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Cancer Risk. According to news reporting originating in Camperdown, Australia, by NewsRx journalists, research stated, "Integration of clinical genetics into oncology is variable. Sarcomas have a strong genetic component, with up to 1/30 patients carrying germline TP53 mutations."

The news reporters obtained a quote from the research from the University of Sydney, "This study aimed to define genetic risk awareness among sarcoma physicians. Outcomes were attitudes toward genetic testing, level of cancer risk and awareness of risk reduction measures. An online survey was administered to members of the Connective Tissue Oncology Society and the Australasian Sarcoma Study Group. Sarcoma physicians (N=124) from 21 countries participated, 40% of whom favored TP53 mutation testing in children regardless of family history, increasing to ≥83% for all age groups if a family history was present and ≥85% if multiple primary cancers were present. However, 33% were not aware that risk reduction strategies might identify some cancers at a more curable stage in carriers. Clinical genetics is not yet standard of care for multidisciplinary management of sarcoma. Awareness of genetic risk is important among sarcoma physicians. Attitudes among the sarcoma community were generally positive, but education on genetic risk in sarcoma patients and collaboration with clinical genetics services might improve quality of care."

According to the news reporters, the research concluded: "Sarcoma physicians need routine access to clinical genetics services so that potential germline TP53 mutation carriers are recognized."

Our news correspondents report that additional information may be obtained by contacting K.A. McBride, School of Public Health, Sydney Medical School, University of Sydney, Camperdown, New South Wales, Australia. Additional authors for this research include T.E. Schlub, M.L. Ballinger, D.M. Thomas and M.H Tattersall.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ajco.12457. This DOI is a link to an online electronic document that is either free or for purchase.
Studies from University of Sydney Yield New Information about Atherosclerosis (The Role of CC-Chemokines in the Regulation of Angiogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Atherosclerosis is now available. According to news reporting originating from Sydney, Australia, by NewsRx correspondents, research stated, "Angiogenesis, the formation of new blood vessels, is critical for survival and in the regenerative response to tissue injury or ischemia. However, in diseases such as cancer and atherosclerosis, inflammation can cause unregulated angiogenesis leading to excessive neovascularization, which exacerbates disease."

Our news editors obtained a quote from the research from the University of Sydney, "Current anti-angiogenic therapies cause complete inhibition of both inflammatory and ischemia driven angiogenesis causing a range of side effects in patients. Specific inhibition of inflammation-driven angiogenesis would therefore be immensely valuable. Increasing evidence suggests that the CC-chemokine class promotes inflammation-driven angiogenesis, whilst there is little evidence for a role in ischemia-mediated angiogenesis. The differential regulation of angiogenesis by CC-chemokines suggests it may provide an alternate strategy to treat angiogenesis associated pathological diseases. The focus of this review is to highlight the significant role of the CC-chemokine class in inflammation, versus ischemia driven angiogenesis, and to discuss the related pathologies including atherosclerosis, cancer, and rheumatoid arthritis. We examine the pros and cons of anti-angiogenic therapies currently in clinical trials."

According to the news editors, the research concluded: "We also reveal novel therapeutic strategies that cause broad-spectrum inhibition of the CC-chemokine class that may have future potential for the specific inhibition of inflammatory angiogenesis."

For more information on this research see: The Role of CC-Chemokines in the Regulation of Angiogenesis. *International Journal of Molecular Sciences*, 2016;17(11):1440-1455. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

The news editors report that additional information may be obtained by contacting A. Ridiandries, University of Sydney, Sydney Med Sch, Sydney, NSW 2050, Australia. Additional authors for this research include J.T.M. Tan and C.A. Bursill.

Studies from University of Tampere Have Provided New Information about HIV/AIDS (Estimates of CDC-Funded and National HIV Diagnoses: A Comparison by Demographic and HIV-related Factors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immune System Diseases and Conditions - HIV/AIDS are presented in a new report. According to news reporting originating from Tampere, Finland, by NewsRx correspondents, research stated, "To determine whether CDC-funded HIV testing programs are reaching persons disproportionately affected by HIV infection. The percentage distribution for HIV testing and diagnoses by demographics and transmission risk group (diagnoses only) were calculated using 2013 data from CDC's National HIV Surveillance System and CDC's national HIV testing program data."

Our news editors obtained a quote from the research from University of Tampere, "In 2013, nearly 3.2 million CDC-funded tests were provided to persons aged 13 years and older. Among persons who received a CDC-funded test, 41.1% were aged 20-29 years; 49.2% were male, 46.2% were black/African American, and 56.2% of the tests were conducted in the South. Compared with the characteristics of all persons diagnosed with HIV in the United States in 2013, among persons diagnosed as a result of CDC-funded tests, a higher percentage were aged 20-29 years (40.3 vs 33.7%) and black/African American (55.3 vs 46.0%)."

According to the news editors, the research concluded: "CDC-funded HIV testing programs are reaching young people and blacks/African Americans."

For more information on this research see: Estimates of CDC-Funded and National HIV Diagnoses: A Comparison by Demographic and HIV-related Factors. AIDS and Behavior, 2016;20(12):2961-2965. AIDS and Behavior can be contacted at: Springer, Plenum Publishers, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; AIDS and Behavior - www.springerlink.com/content/1090-7165/)

Studies from University of Tasmania Have Provided New Information about Antibiotics (Antimicrobial drug use in primary healthcare clinics: a retrospective evaluation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antibiotics have been published. According to news reporting originating in Hobart, Australia, by NewsRx journalists, research stated, "To examine the appropriateness of antibiotics prescribed for acute infection based on the Malaysian national antibiotic guidelines and the defined daily dose (DDD) system of the World Health Organization (WHO). This study also aimed to describe the factors influencing the drug use pattern and to investigate the procurement patterns of antibiotics in the primary healthcare setting."

The news reporters obtained a quote from the research from the University of Tasmania, "A retrospective cohort follow-up study of randomly selected patients from all patients who received any antibiotic between January and December 2013 was conducted at three primary healthcare clinics in Selangor State of Malaysia. For each patient, the following information was recorded: name of the antibiotic, frequency and dose, and Anatomical Therapeutic Chemical (ATC) group. The defined daily dose per 1000 inhabitants per day was calculated for each antibiotic. The national antibiotic guidelines were used to assess the appropriateness of each antibiotic prescription. A total of 735 patients were included in the study. The five most used antibiotics were amoxicillin (1.36 g, 35.2%), cloxacillin (0.68 g, 26.3%), erythromycin (0.32 g, 22.3%), bacampicillin (0.13 g, 7.2%), and cephalexin (0.11 g, 6.9%). Respiratory tract infections were the most commonly treated infections, and the doctors' preferred antibiotic for the treatment of these infections was amoxicillin. More than 18% of all amoxicillin prescriptions were deemed inappropriate according to the national antibiotic guidelines. In terms of procurement costs, USD 88,885 was spent in 2011, USD 219,402 in 2012, and USD 233,034 in 2013 at the three primary healthcare clinics, an average of USD 180,440 per year for the three clinics. This study reports the antibiotic usage at three primary healthcare clinics in Klang Province. The most prescribed antibiotic was amoxicillin in capsules (250 mg), which was mainly prescribed for respiratory infections. Although the national antibiotic guidelines state that amoxicillin is a preferred drug for acute bacterial rhinosinusitis, this drug is also being prescribed for other disease conditions, such as acute pharyngitis and acute tonsillitis."

According to the news reporters, the research concluded: "This result shows that current practice is not following the current antibiotic guidelines, which state that phenoxy penicillin should be the preferred drug."

Our news correspondents report that additional information may be obtained by contacting L.C. Ming, University of Tasmania, Unit Medicat Outcomes Res & Educ UMORE, Pharm, Hobart, Tas, Australia. Additional authors for this research include M.E. Akkawi, S.T.R. Zaidi, L.C. Ming and M.M. Manan.
The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijid.2016.09.013. This DOI is a link to an online electronic document that is either free or for purchase.

**Triterpenes**

**Studies from University of Technology Have Provided New Information about Triterpenes [Drug-eluting coating of ginsenoside Rg1 and Re incorporated poly (lactic-co-glycolic acid) on stainless steel 316L: Physicochemical and drug release analyses]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Triterpenes is the subject of a report. According to news reporting originating from Johor Baharu, Malaysia, by NewsRx correspondents, research stated, "Active ingredients of ginsenoside, Rg1 and Re, are able to inhibit the proliferation of vascular smooth muscle cells and promote the growth of vascular endothelial cells. These capabilities are of interest for developing a novel drug-eluting stent to potentially solve the current problem of late-stent thrombosis and poor endotheliazation."

Our news editors obtained a quote from the research from the University of Technology, "Therefore, this study was aimed to incorporate ginsenoside into degradable coating of poly(lactic-co-glycolic acid) (PLGA). Drug mixture composed of ginseng extract and 10% to 50% of PLGA (xPLGA/g) was coated on electropolished stainless steel 316L substrate by using a dip coating technique. The coating was characterized principally by using attenuated total reflectance-Fourier transform infrared spectroscopy, scanning electron microscopy and contact angle analysis, while the drug release profile of ginsenosides Rg1 and Re was determined by using mass spectrometry at a one month immersion period. Full and homogenous coating coverage with acceptable wettability was found on the 30PLGA/g specimen. All specimens underwent initial burst release dependent on their composition. The 30PLGA/g and 50PLGA/g specimens demonstrated a controlled drug release profile having a combination of diffusion-and swelling-controlled mechanisms of PLGA."

According to the news editors, the research concluded: "The study suggests that the 30PLGA/g coated specimen expresses an optimum composition which is seen as practicable for developing a controlled release drug-eluting stent."

The news editors report that additional information may be obtained by contacting S. Saidin, Univ Teknol Malaysia, Fac Biosci & Med Engn, Johor Baharu 81310, Malaysia.
Catheterization

Studies from University of Tennessee Have Provided New Data on Catheterization (Gaining a New Skill With the Risk of Losing One: The Effect of 195 Radial Catheterization)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Catheterization is the subject of a report. According to news reporting originating in Knoxville, Tennessee, by NewsRx journalists, research stated, "The adoption of radial catheterization has been relatively slow in the United States. This study was conducted to assess the perceived comfort level of cardiology fellows with radial catheterizations and to predict the practice patterns in the United States in the near future."

The news reporters obtained a quote from the research from the University of Tennessee, "A 21-question survey on cardiology fellows' preferred cardiac catheterization access site was conducted between April and June 2015. Data on access preference and perceived competency were analyzed based on the fellow's level of training and type of training program (university vs community). A total of 101 responses were received from a total of 250 invitations; 85 (85%) of these respondents completed all questions. Data were collected from fellows of several programs nationwide. Of the 85 respondents with complete data, 22%, 29%, and 19% were first-, second-, and third-year interventional fellows respectively. Most respondents (82%) were from university-based programs, 46.3% of respondents considered that their programs provided a balance of both radial and femoral training. Irrespective of the training year, most fellows seemed to prefer radial over femoral access. Senior fellows appeared to be equally comfortable with a femoral access approach (P = 0.03). There was no difference by training site (university vs community programs) (P = 0.921). In 2015, US cardiology fellows appear to prefer radial over femoral access for cardiac catheterizations."

According to the news reporters, the research concluded: "Although it is good to see the shift toward better radial access skills, we need to stress the importance of the femoral skills that would be necessary to keep in the armamentarium of interventional cardiologists."

Our news correspondents report that additional information may be obtained by contacting O. Bolorunduro, University of Tennessee, Hlth Sci Center, Div Cardiol, Knoxville, TN 37996, United States. Additional authors for this research include T. Bob-Manuel, Y. Cheema, A. Raza and R. Khouzam.

Keywords for this news article include: Knoxville, Tennessee, United States, North and Central America, Cardiology, Article Review, Catheterization, University of Tennessee.

Therapeutics

Studies from University of Tennessee in the Area of Therapeutics Described (Drug therapy problems and medication discrepancies during care transitions in super-utilizers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Therapeutics. According to news reporting from Memphis, Tennessee, by NewsRx journalists, research stated, "First, to investigate the prevalence and types of drug therapy problems and medication discrepancies among super-utilizers, and associated patient characteristics. Second, to examine the outcomes of pharmacist recommendations and estimated cost avoidance through care transitions support focused on medication management."

The news correspondents obtained a quote from the research from the University of Tennessee, "Retrospective analysis of the pharmacist-led interventions as part of the SafeMed Program. A large nonprofit health care system serving the major medically underserved areas in Memphis, Tennessee. Three hundred seventy-four super-utilizing SafeMed participants with multiple chronic conditions and polypharmacy. Comprehensive medication review, medication therapy management, enhanced discharge planning, home visits, telephone follow-up, postdischarge medication reconciliation, and care coordination with physicians. Types of drug therapy problems, outcomes of pharmacist recommendations, estimated cost avoided, medication discrepancies, and self-reported medication adherence. Prevalence of drug therapy problems and postdischarge medication discrepancies was 80.7% and 75.4%, respectively. The most frequently occurring drug therapy problems were enrollee not receiving needed medications (33.4%), underuse of medications (16.9%), and insufficient dose or duration (11.2%). Overall 50.8% of the pharmacist recommendations were accepted by physicians and patients, resulting in an estimated cost avoidance of $293.30 per drug therapy problem identified. Multivariate analysis indicated that participants with a higher number of comorbidities were more likely to have medication discrepancies (odds ratio 1.23 [95% CI 1.05-1.44]). Additional contributors to postdischarge medication discrepancies were difficulty picking up and paying for medications and not being given necessary prescriptions before discharge. Drug therapy problems and medication discrepancies are common in super-utilizers with multiple chronic conditions and polypharmacy during transitions of care, and greater levels of comorbidity magnify risk. Pharmacist-led interventions in the SafeMed Program have demonstrated success in resolving enrollees' medication-related issues, resulting in substantial estimated cost savings."

According to the news reporters, the research concluded: "Preliminary evidence suggests that the SafeMed model's focus on medication management has great potential to improve outcomes while reducing costs for vulnerable super-utilizing populations nationwide."

Our news journalists report that additional information may be obtained by
contacting J.E. Bailey, University of Tennessee, Center Hlth Sci, Dept. of Prevent Med, Memphis, TN 38163, United States. Additional authors for this research include K.D. Munshi, P.C. Bell and J.E. Bailey.

Pregnancy Complications - Ectopic Pregnancy

Studies from University of Texas Describe New Findings in Ectopic Pregnancy (Conservative Management of Cervical Ectopic Pregnancy with Uterine Artery Embolization and Development of Uterine Artery Pseudoaneurysm A Case Report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Pregnancy Complications - Ectopic Pregnancy is the subject of a report. According to news reporting originating in Houston, Texas, by NewsRx journalists, research stated, "Cervical ectopic pregnancy is rare. Early diagnosis is now often possible, enabling conservative treatment."

The news reporters obtained a quote from the research from the University of Texas, "A rare sequela is development of uterine artery pseudoaneurysm CASE: A 41-year-old woman presented with a cervical ectopic pregnancy at 9 weeks' gestation. She desired future fertility, and conservative measures were used: intramuscular methotrexate, uterine artery embolization, and intrathoracic KCl injection. She subsequently represented and was diagnosed with a uterine artery pseudoaneurysm. This was conservatively managed with cervical tamponade and bilateral uterine artery and right ovarian artery embolization. Ultimately our patient decided against future fertility and underwent an uncomplicated bilateral tubal ligation. Uterine artery pseudoaneurysm is a rare finding. In our patient we believe it was due to her cervical pregnancy."

According to the news reporters, the research concluded: "Embolization and cervical tamponade allowed for conservative management."

Our news correspondents report that additional information may be obtained by contacting P.D. Berens, Univ Texas Houston, Sch Med, Houston, TX, United States. Additional authors for this research include A. Cohen, M. Bebbington and P.D. Berens.

Our reports deliver fact-based news of research and discoveries from around the
Drugs and Therapies - Behavioural Pharmacology

Studies from University of Texas Health Science Center Describe New Findings in Behavioural Pharmacology (Effect of daily morphine administration and its discontinuation on delay discounting of food in rhesus monkeys)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Behavioural Pharmacology are discussed in a new report. According to news reporting out of San Antonio, Texas, by NewsRx editors, research stated, "Opioid abusers discount delayed reinforcers more rapidly than nonusers; however, it is unclear whether chronic drug administration or its discontinuation impacts discounting. This study examined the impact of daily morphine administration and its discontinuation on delay discounting of food in rhesus monkeys."

Our news journalists obtained a quote from the research from the University of Texas Health Science Center, "Responding on one lever delivered one food pellet immediately; responding on another lever delivered two food pellets either immediately or after a delay (30-120 s) that increased within the session. Monkeys (n=3) responded for the large reinforcer when both reinforcers were delivered immediately and more for the smaller, immediately available reinforcer as the delay to delivery of the large reinforcer increased. When administered acutely, morphine (0.032-5.6 mg/kg) increased trial omissions and had variable effects on choice, with small doses decreasing and large doses increasing choice of the large delayed reinforcer. Chronic morphine administration (0.1 mg/kg/day to 3.2 mg/kg twice daily) reduced choice of the large delayed reinforcer in two monkeys, while increasing choice in a third monkey. Despite the development of tolerance to some effects (i.e. rightward shifts in dose-effect curves for the number of trials omitted) and evidence of mild opioid dependence (e.g. decrease in the number of trials completed, as well as body weight), discontinuation of treatment did not appear to systematically impact discounting."

According to the news editors, the research concluded: "Overall, these results suggest that repeated opioid administration causes persistent effects on choice under a delay discounting procedure; however, differences in the direction of effect among individuals suggest that factors other than, or in addition to, changes in discounting might play a role."

For more information on this research see: "Effect of daily morphine administration and its discontinuation on delay discounting of food in rhesus monkeys. Behavioural Pharmacology, 2016;27(2-3 Spec I):155-64. (Lippincott Williams and Wilkins - www.lww.com; Behavioural Pharmacology - journals.lww.com/behaviouralpharm/pages/default.aspx"

Our news journalists report that additional information may be obtained by contacting D.R. Maguire, Departments of aPharmacology bPsychiatry, University of Texas Health Science Center at San Antonio, San Antonio, Texas, United States. Additional authors for this research include L.R. Gerak and C.P France.

**Drugs and Therapies - Smoking Cessation Agents**

**Studies from University of Texas Health Science Center Further Understanding of Smoking Cessation Agents (Differential antagonism and tolerance/cross-tolerance among nicotinic acetylcholine receptor agonists: scheduled-controlled responding and ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Smoking Cessation Agents is the subject of a report. According to news reporting from San Antonio, Texas, by NewsRx journalists, research stated, "The tobacco-dependence pharmacotherapies varenicline and cytisine act as partial a4b2 nAChR agonists. However, the extent to which a4b2 nicotinic acetylcholine receptors (nAChRs) mediate their in-vivo effects remains unclear."

The news correspondents obtained a quote from the research from the University of Texas Health Science Center, "Nicotine, varenicline, cytisine, and epibatidine were studied in male C57BL/6J mice for their effects on rates of fixed ratio responding and rectal temperature alone and in combination with the nonselective nAChR antagonist mecamylamine and the a4b2 nAChR antagonist dihydro-b-erythroidine. The effects of nicotine, varenicline, cytisine, epibatidine, and cocaine were assessed before and during chronic nicotine treatment. The rate-decreasing and hypothermic effects of nicotine, varenicline, cytisine, and epibatidine were antagonized by mecamylamine (1 mg/kg), but only the effects of nicotine and epibatidine were antagonized by dihydro-b-erythroidine (3.2 mg/kg). Chronic nicotine produced 4.7 and 5.1-fold rightward shifts in the nicotine dose-effect functions to decrease response rate and rectal temperature, respectively. Nicotine treatment decreased the potency of epibatidine to decrease response rate and rectal temperature 2.2 and 2.9-fold, respectively, and shifted the varenicline dose-effect functions 2.0 and 1.7-fold rightward, respectively. Cross-tolerance did not develop from nicotine to cytisine."

According to the news reporters, the research concluded: "These results suggest that the in-vivo pharmacology of tobacco cessation aids cannot be attributed to a single nAChR subtype; instead, multiple receptor subtypes differentially mediate their effects."

For more information on this research see: Differential antagonism and tolerance/cross-tolerance among nicotinic acetylcholine receptor agonists: scheduled-controlled responding and hypothermia in C57BL/6J mice. *Behavioural Pharmacology*, 2016;27(2-3 Spec I):240-8. (Lippincott Williams and Wilkins - www.lww.com; Behavioural Pharmacology - journals.lww.com/behaviouralpharm/pages/default.aspx)

Clinical Research - Clinical Trials and Studies

Studies from University of Texas Southwestern Describe New Findings in Clinical Trials and Studies (Glutathione Depletion, Pentose Phosphate Pathway Activation, and Hemolysis in Erythrocytes Protecting Cancer Cells from Vitamin C-induced ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Clinical Research - Clinical Trials and Studies are discussed in a new report. According to news reporting originating from Dallas, Texas, by NewsRx correspondents, research stated, "The discovery that oxidized vitamin C, dehydroascorbate (DHA), can induce oxidative stress and cell death in cancer cells has rekindled interest in the use of high dose vitamin C (VC) as a cancer therapy. However, high dose VC has shown limited efficacy in clinical trials, possibly due to the decreased bioavailability of oral VC."

Funders for this research include Burroughs Wellcome Fund, National Institutes of Health.

Our news editors obtained a quote from the research from the University of Texas Southwestern, "Because human erythrocytes express high levels of Glut1, take up DHA, and reduce it to VC, we tested how erythrocytes might impact high dose VC therapies. Cancer cells are protected from VC-mediated cell death when co-cultured with physiologically relevant numbers of erythrocytes. Pharmacological doses of VC induce oxidative stress, GSH depletion, and increased glucose flux through the oxidative pentose phosphate pathway (PPP) in erythrocytes. Incubation of erythrocytes with VC induced hemolysis, which was exacerbated in erythrocytes from glucose-6-phosphate dehydrogenase (G6PD) patients and rescued by antioxidants. Thus, erythrocytes protect cancer cells from VC-induced oxidative stress and undergo hemolysis in vitro, despite activation of the PPP."

According to the news editors, the research concluded: "These results have implications on the use of high dose VC in ongoing clinical trials and highlight the importance of the PPP in the response to oxidative stress."

The news editors report that additional information may be obtained by contacting R.C. Wang, Univ Texas Southwestern Med Center Dallas, Dept. of Dermatol, Dallas, TX 75390, United States. Additional authors for this research include E.E. Lee, J. Sudderth, Y.B. Yue, A. Zia, D. Glass, R.J. Deberardinis and R.C. Wang.

Drugs and Therapies - Clopidogrel Therapy

Studies from University of Texas Southwestern Have Provided New Data on Clopidogrel Therapy [Oral P2Y(12) Receptor Inhibitors in Hemodialysis Patients Undergoing Percutaneous Coronary Interventions: Current Knowledge and Future Directions]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Clopidogrel Therapy have been published. According to news originating from Dallas, Texas, by NewsRx correspondents, research stated, "Oral P2Y(12) receptor inhibitors are commonly used drugs in patients on hemodialysis (HD) to treat acute coronary syndrome with or without percutaneous coronary intervention (PCI), and patients with stable coronary artery disease after PCI."

Our news journalists obtained a quote from the research from the University of Texas Southwestern, "Clopidogrel is the most commonly prescribed P2Y(12) receptor inhibitor because it is effective in the general population and is not as costly as newer FDA-approved agents (prasugrel, ticagrelor). However, increasing evidence is accumulating that clopidogrel may not be as effective in reducing mortality and preventing future ischemic events in patients with kidney disease."

According to the news editors, the research concluded: "In this review, we will explore some of the studies that form the basis for this statement and discuss potential pharmacokinetic and pharmacodynamic reasons why clopidogrel might be less effective in HD patients, as well as explore potential risks and benefits of alternatives to clopidogrel therapy."

The news correspondents report that additional information may be obtained from R.F. Reilly, Univ Texas Southwestern Med Center, Dept. of Med, Div Nephrol, Dallas, TX, United States.

Keywords for this news article include: Dallas, Texas, United States, North and Central America, Platelet Aggregation Inhibitors, Hemodialysis, Article Review, Coagulation Modifiers, Drugs and Therapies, Antiplatelet Agents, Clopidogrel Therapy, Fibrinolytic Agents, Renal Dialysis, University of Texas Southwestern.

Palliative and Supportive Care

Studies from University of Texas Update Current Data on Palliative and Supportive Care (Referral criteria for outpatient specialty palliative cancer care: an international consensus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Palliative and Supportive Care have been published. According to news reporting out of Houston, Texas, by NewsRx editors, research stated, "Although outpatient specialty palliative-care clinics improve outcomes, there is no consensus on who should be referred or the optimal timing for referral. In response to this issue, we did a Delphi study to develop consensus on a list of criteria for referral of patients with advanced cancer at secondary or tertiary care hospitals to outpatient palliative care. 60 international experts (26 from North America, 19 from Asia and Australia, and 11 from Europe) on palliative cancer care rated 39 needs-based criteria and 22 time-based criteria in three iterative rounds.

Our news journalists obtained a quote from the research from the University of Texas, "Nearly all experts responded in each round. Consensus was defined by an a-priori agreement of 70% or more. Panellists reached consensus on 11 major criteria for referral: severe physical symptoms, severe emotional symptoms, request for hastened death, spiritual or existential crisis, assistance with decision making or care planning, patient request for referral, delirium, spinal cord compression, brain or leptomeningeal metastases, within 3 months of advanced cancer diagnosis for patients with median survival of 1 year or less, and progressive disease despite second-line therapy. Consensus was also reached on 36 minor criteria for specialist palliative-care referral."

According to the news editors, the research concluded: "These criteria, if validated, could provide guidance for identification of patients suitable for outpatient specialty palliative care."

Our news journalists report that additional information may be obtained by contacting D. Hui, Univ Texas MD Anderson Canc Center, Dept. of Palliat Care Rehabil & Integrat Med, Houston, TX 77030, United States. Additional authors for this research include M. Mori, S.M. Watanabe, A. Caraceni, F. Strasser, T. Saarto, N. Cherny, P. Glare, S. Kaasa and E. Bruera.

Hematologic Diseases and Conditions - Polycythemia

Studies from University of Texas Update Current Data on Polycythemia (Drug Development Pipeline for Myeloproliferative Neoplasms: Potential Future Impact on Guidelines and Management)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Hematologic Diseases and Conditions - Polycythemia. According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "The unprecedented success of ruxolitinib in myelofibrosis (MF) has paved the way for the development of other Janus kinase (JAK) inhibitors and other agents representing diverse drug classes and mechanisms of action in myeloproliferative neoplasms (MPNs). In particular, the symptomatic benefits afforded by ruxolitinib have led to the recognition of 'clinical improvement' in symptoms and the spleen in international consensus response criteria for MF."

The news correspondents obtained a quote from the research from the University of Texas, "Ruxolitinib is also approved for the second-line treatment of polycythemia vera and is being developed for essential thrombocythemia. Appreciation of the universal role of activated JAK/signal transducer and activator of transcription (STAT) signaling in MPNs and improved understanding of the canonical and noncanonical actions of JAK2 have yielded a number of drug targets beyond JAK2 in MPNs, which form the basis for a number of ruxolitinib-based rational combinations that are being explored in MF. Other JAK inhibitors with the potential for significantly less myelosuppression or even improvement of anemia continue to be tested. Finally, agents with very distinct mechanisms of action, such as novel interferon formulations, antifibrotic agents, and telomerase inhibitors, are being pursued in polycythemia vera and MF, respectively."

According to the news reporters, the research concluded: "This article reviews the current landscape of clinical drug development in MPNs, focusing on the most promising agents and combinations."

Our news journalists report that additional information may be obtained by contacting P. Bose, Univ Texas MD Anderson Canc Center, Houston, TX 77030, United States.

Oncology - Bone Cancer

Studies from University of Tokyo Yield New Data on Bone Cancer (Dual Therapeutic Action of a Neutralizing Anti-FGF2 Aptamer in Bone Disease and Bone Cancer Pain)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Bone Cancer have been published. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "Fibroblast growth factor 2 (FGF2) plays a crucial role in bone remodeling and disease progression. However, the potential of FGF2 antagonists for treatment of patients with bone diseases has not yet been explored."

Our news journalists obtained a quote from the research from the University of Tokyo, "Therefore, we generated a novel RNA aptamer, APT-F2, specific for human FGF2 and characterized its properties in vitro and in vivo. APT-F2 blocked binding of FGF2 to each of its four cellular receptors, inhibited FGF2-induced downstream signaling and cells proliferation, and restored osteoblast differentiation blocked by FGF2. APT-F2P, a PEGylated form of APT-F2, effectively blocked the bone disruption in mouse and rat models of arthritis and osteoporosis. Treatment with APT-F2P also exerted a strong analgesic effect, equivalent to morphine, in a mouse model of bone cancer pain."

According to the news editors, the research concluded: "These findings demonstrated dual therapeutic action of APT-F2P in bone diseases and pain, providing a promising approach to the treatment of bone diseases."

For more information on this research see: Dual Therapeutic Action of a Neutralizing Anti-FGF2 Aptamer in Bone Disease and Bone Cancer Pain. Molecular Therapy, 2016;24(11):1974-1986. Molecular Therapy can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. Surgery - General Surgery

Studies from University of Tokyo in the Area of General Surgery Described (Anatomy of the middle rectal artery: a review of the historical literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Surgery - General Surgery have been published. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "The middle rectal artery is a crucial blood vessel in the abdomen, providing an important source of blood supply to the rectum. In this study, we conducted a detailed review of the historical literature on the anatomy of the middle rectal artery, aiming to provide a comprehensive understanding of this anatomical feature."

According to the news editors, the research concluded: "This study offers valuable insights into the anatomy of the middle rectal artery, with implications for various surgical procedures in the region."

Our news journalists report that additional information may be obtained by contacting a contact person at the University of Tokyo, Department of Surgery, Tokyo, Japan. Additional authors for this research include S. Nonaka, M. Miyakawa, Y. Fujiwara and Y. Nakamura.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1001/jamasurg.2016.0626. This DOI is a link to an online electronic document that is either free or for purchase.

Wellness Week -- Research findings on Surgery - General Surgery are discussed in a new report. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "The middle rectal artery is a very important anatomical structure in rectal cancer surgery. It is the only vessel that penetrates through the proper rectal fascia into the pelvic cavity, and therefore threatens the integrity of total mesorectal excision."

Our news journalists obtained a quote from the research from the University of Tokyo, "Moreover, it is very closely related to the lateral lymphatic drainage root. The definition of the middle rectal artery is ambiguous, and different frequencies, origins, and trajectories have been reported in various papers. The frequency of the middle rectal artery is reported to range from 12 to 97%. Traditionally, the middle rectal artery is described as an artery that penetrates the pelvic plexus from the lateral side along with the lateral ligament; the frequency of this lateral type of middle rectal artery ranges from 20 to 30%. However, the reports that describe higher frequency values also consider another type of middle rectal artery, which penetrates the neuro-vascular bundle from the antero-lateral direction; this antero-lateral type of middle rectal artery tends to be a small vessel, and frequently forms a common trunk with the prostatic artery."

According to the news editors, the research concluded: "With advancements in endoscopic surgery, the knowledge of the precise anatomy of this structure is becoming more crucial for optimal rectal cancer surgery."

Our news journalists report that additional information may be obtained by contacting T. Kiyomatsu, University of Tokyo, Dept. of Surg Oncol, Bunkyo Ku, Tokyo 1138655, Japan. Pancreatic Cysts

Studies from University of Tokyo in the Area of Pancreatic Cysts Reported (Pancreatic cysts in general population on ultrasonography: Prevalence and development of risk score)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Pancreatic Cysts. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "Pancreatic cysts are related to the presence of ductal adenocarcinomas elsewhere in the pancreas, and are also associated with an increased risk of pancreatic adenocarcinoma in the future. Most of the previous studies
that investigated the prevalence of pancreatic cysts focused on patients within a hospital or outpatient setting, which may not be representative of the general population."

Our news journalists obtained a quote from the research from the University of Tokyo, "We investigated the prevalence and predictive factors for the presence of pancreatic cysts within a large number of subjects via general health examination. Between December 2007 and December 2013, a total of 5198 subjects were enrolled that underwent ultrasonography (US) on general health examination. We established a scoring system for predicting the presence of one or more pancreatic cysts using a split-sample method. Among the enrolled subjects, the prevalence of a pancreatic cyst was 3.5 %. In multivariate analysis, the prevalence was significantly increased with older age, female sex, and the presence of gall bladder adenomyomatosis (GB-ADM). Based on multivariate analysis in the training sample (n = 2,599), we established the scoring system consisting of age, sex, and the presence of GB-ADM to predict the presence of pancreatic cysts. This scoring system was validated in the testing sample (n = 2,599) and produced an area under the curve of 0.711. The prevalence of pancreatic cyst detected by US was 3.5 % in the general population, and increased with age, female sex, and the presence of GB-ADM."

According to the news editors, the research concluded: "A new scoring system developed in the present study may help to identify better candidates for further examination when the pancreas is not visible by US."

For more information on this research see: Pancreatic cysts in general population on ultrasonography: Prevalence and development of risk score. Journal of Gastroenterology, 2016;51(12):1133-1140. Journal of Gastroenterology can be contacted at: Springer Japan Kk, Chiyoda First Bldg East, 3-8-1 Nishi-Kanda, Chiyoda-Ku, Tokyo, 101-0065, Japan. Biotechnology - Molecular Pharmaceutics

Studies from University of Torino in the Area of Molecular Pharmaceutics Described (A Fast Chromatographic Method for Estimating Lipophilicity and Ionization in Nonpolar Membrane-Like Environment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Biotechnology - Molecular Pharmaceutics. According to news reporting originating from Torino, Italy, by NewsRx correspondents,
research stated, "This study describes the design and implementation of a new chromatographic descriptor called log k’80 PLRP-S that provides information about the lipophilicity of drug molecules in the nonpolar environment, both in their neutral and ionized form. The log k’80 PLRP-S obtained on a polymeric column with acetonitrile/water mobile phase is shown to closely relate to log Ptoluene (toluene dielectric constant e ∼ 2)."

Our news editors obtained a quote from the research from the University of Torino, "The main intermolecular interactions governing log k’80 PLRP-S were deconvoluted using the Block Relevance (BR) analysis. The information provided by this descriptor was compared to ElogD and calclog Ptol, and the differences are highlighted. The 'charge-flush' concept is introduced to describe the sensitivity of log k’80 PLRP-S to the ionization state of compounds in the pH range 2 to 12."

According to the news editors, the research concluded: "The ability of log k’80 PLRP-S to indicate the propensity of neutral molecules and monoanions to form Intramolecular Hydrogen Bonds (IMHBs) is proven through a number of examples."

The news editors report that additional information may be obtained by contacting G. Caron, Molecular Biotechnology and Health Sciences Department, Universita degli Studi di Torino, via Quarello 15, 10135 Torino, Italy. Additional authors for this research include M. Vallaro, G. Ermondi, G.H. Goetz, Y.A. Abramov, L. Philippe and M. Shalaeva.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.molpharmaceut.5b00910. This DOI is a link to an online electronic document that is either free or for purchase.

Immunology - Immunoproteins

Studies from University of Toronto Add New Findings in the Area of Immunoproteins (Use of intravenous immunoglobulin in neonates at a tertiary academic hospital: a retrospective 11-year study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Immunoproteins have been published. According to news originating from Toronto, Canada, by NewsRx correspondents, research stated, "Intravenous immunoglobulin (IVIG) is used to treat a variety of diseases in the neonatal intensive care unit (NICU). Although audits have reported on the spectrum of IVIG use in adults, the indications and utilization in neonates has not been investigated."

Our news journalists obtained a quote from the research from the University of Toronto, "The objectives of this study were to describe the usage pattern of and indications for IVIG in a tertiary care NICU. A retrospective chart review was performed of all neonates who received IVIG in the NICU from January 2003 to December 2013. Data collected included patient demographic features, antenatal maternal details, neonatal laboratory results, treatment..."
details, adverse events, and patient outcome. Thirty-seven neonates received IVIG over the 11-year period. Twenty-three (67%) were treated for hemolytic disease of the newborn (HDN); 13 treatments were ABO related, six were anti-D related, and four were for clinically significant antibodies. Fourteen (33%) were treated for non-HDN causes, including eight for septic neonates, two for neonates with necrotizing enterocolitis, two for neonates with a clinically significant antibody but without evidence of hemolysis, and two for neonates with glucose 6-phosphate dehydrogenase deficiency. A complete hemolytic workup was not performed consistently before the receipt of IVIG. This novel assessment of IVIG use in the NICU revealed the spectrum of disease for which IVIG is ordered. This study also found that key diagnostic tests needed to confirm an immune etiology for idiopathic jaundice are not performed routinely before IVIG receipt."

According to the news editors, the research concluded: "Neonatal transfusion-related databases are needed to carry out pragmatic clinical trials to establish better evidence-based guidelines for IVIG therapy in the NICU."

The news correspondents report that additional information may be obtained from L. Lieberman, University of Toronto, Dept. of Lab Med & Pathobiol, Toronto, ON, Canada. Additional authors for this research include J. Spradbrow, A. Keir, M. Dunn, Y.L. Lin and J. Callum.

Studies from University of Toronto Add New Findings in the Area of Nephrectomy (Morbidity and Mortality of Radical Nephrectomy for Patients With Disseminated Cancer: An Analysis of the National Surgical Quality Improvement Program Database)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Surgery - Nephrectomy. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "To determine the effect of disseminated cancer on perioperative outcomes following radical nephrectomy. We conducted a retrospective cohort study of patients undergoing radical nephrectomy for kidney cancer from 2005 to 2014 using the American College of Surgeons National Surgical Quality Improvement Program, a multi-institutional prospective registry that captures perioperative surgical complications."

Our news editors obtained a quote from the research from the University of Toronto, "Patients were stratified according to the presence (n = 657) or absence (n = 7143) of
disseminated cancer at the time of surgery. We examined major complications (death, reoperation, cardiac event, or neurologic event) within 30 days of surgery. Secondary outcomes included pulmonary, infectious, venous thromboembolic, and bleeding complications; prolonged length of stay; and concomitant procedures (bowel, liver, spleen, pancreas, and vascular procedures). Adjusted odds ratio (aOR) and 95% confidence interval (95% CI) were calculated using multivariate logistic regression models. Patients with disseminated cancer were older and more likely to be male, have greater comorbidities, and have undergone open surgery. Major complications were more common among patients with disseminated cancer (7.8%) than those without disseminated cancer (3.2%; aOR 2.01, 95% CI 1.46-2.86). Mortality was significantly higher in patients with disseminated cancer (3.2%) than those without disseminated cancer (0.5%; P<.0001). Pulmonary (aOR 1.68, 95% CI 1.09-2.59), thromboembolic (aOR 1.72, 95% CI 1.01-2.96), and bleeding complications (aOR 2.12, 95% CI 1.73-2.60) were more common among patients with disseminated cancer as was prolonged length of stay (aOR 1.27, 95% CI 1.06-1.53). Nephrectomy in patients with disseminated cancer is a morbid operation with significant perioperative mortality."

According to the news editors, the research concluded: "These data may be used for preoperative counseling of patients undergoing cytoreductive nephrectomy."

The news editors report that additional information may be obtained by contacting C.J.D. Wallis, University of Toronto, Univ Hlth Network, Toronto, ON M5S 1A1, Canada. Additional authors for this research include G. Bjarnason, J. Byrne, D.C. Cheung, A. Hoffman, G.S. Kulkarni, A.B. Nathens, R.K. Nam and R. Satkunasivam.

**Liver Diseases and Conditions - Chronic Hepatitis B…**

**Studies from University of Toronto Have Provided New Data on Chronic Hepatitis B Virus [Prevalence and risk factors for viral blipping in chronic hepatitis B patients treated with nucleos (t) ide analogues]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Liver Diseases and Conditions - Chronic Hepatitis B Virus. According to news reporting out of Toronto, Canada, by NewsRx editors, research stated, "The clinical relevance of viral blipping during nucleos (t) ide analogue (NA) treatment is unclear in chronic hepatitis B (CHB). We investigated the prevalence, risk factors and clinical outcomes for those with viral blipping during NA treatment."
Our news journalists obtained a quote from the research from the University of Toronto, "A retrospective cohort study investigated consecutively treated CHB patients from May 2008 to February 2015 on the NAs such as entecavir (ETV), tenofovir (TDF) and lamivudine (LAM). Included patients were previously treatment naive. Viral blipping was defined as serum HBV DNA >20IU/mL on one occasion, and not >200IU/mL, with subsequent measurement returning to undetectable levels, that is <20IU/mL. A total of 242 treatment-compliant CHB patients were included with 44 (18.2%) experiencing viral blipping. In multivariable Cox regression, Asian race (HR=7.40, 95% CI 1.01-54.29, P<.049), LAM therapy (vs ETV/TDF, HR=2.53, 95% CI 1.29-4.95, P<.007), higher creatinine (per SD, HR=1.47, 95% CI 1.21-1.79, P<.001), HBeAg positivity (HR=2.68, 95% CI 1.39-5.03, P<.003) and longer time to achieve undetectable HBV DNA (per month, HR=1.05, 95% CI 1.02-1.08, P=.001) were associated with an increased risk of viral blipping. Viral blipping did not show any significant association with viral breakthrough, HBsAg loss, ALT flares or disease progression. Viral blipping is a frequent event during NA therapy; however, it did not lead to any clinically significant outcomes."

According to the news editors, the research concluded: "Thus, it may not require more frequent blood work and patient visits in clinical practice."

Our news journalists report that additional information may be obtained by contacting H.L.A. Janssen, University of Toronto, Div Gastroenterol, Toronto Gen Hosp, Toronto, ON, Canada. Additional authors for this research include W.P. Brouwer, T. Hansen, T. Mazzulli, J. Feld, D. Wong, M. Kowgier and H.L.A. Janssen.

screening strategies. Data and methods: The University of Wisconsin Cancer Intervention and Surveillance Modeling Network (CISNET) breast cancer microsimulation model was adapted to simulate breast cancer incidence, screening performance and delivery of optimal therapies in Canada."

The news correspondents obtained a quote from the research from the University of Toronto, "The model considered effects of breast density on incidence and screening performance. Model predictions of incidence, mortality and life-years (LY) gained for a 1960 birth cohort of women for No Screening were compared with 11 digital mammography screening strategies that varied by starting and stopping age and frequency. In the absence of screening, the estimate of LYs lost from breast cancer was 360.1 per 1,000 women, and each woman diagnosed with breast cancer after age 40 who dies of breast cancer would lose an estimated average of 19.1 years. Biennial screening at ages 50 to 74 resulted in an estimated 116.3 LYs saved. Annual screening at ages 40 to 49, followed by biennial screening to age 74, resulted in an estimated 170.3 LY saved. That is, adding annual screening at ages 40 to 49 saved an additional 54 LY per 1,000 women. Screening annually at ages 40 to 74 recovered the most: 214 LY saved. More frequent screening was associated with an increased ratio of detection of ductal in situ to invasive cancers, more abnormal recalls and more negative biopsies, but a reduction in the number of women required to be screened per life saved or per LY saved. In general, mortality reduction was found to be associated with the total number of lifetime screens for breast cancer. However, for the same number of screens, more frequent screening after age 50 appeared to have a greater impact on breast cancer deaths averted than did beginning screening earlier."

According to the news reporters, the research concluded: "When the number of LYs saved by screening was considered, a greater impact was achieved by screening women in their 40s than by reducing the interval between screens."

For more information on this research see: Clinical outcomes of modelling mammography screening strategies. Health Reports, 2015;26(12):9-15. Health Reports can be contacted at: Statistics Canada, 100 Tunneys Pasture Driveway, Ottawa, Ontario K1A 0T6, Canada.

Our news journalists report that additional information may be obtained by contacting M.J. Yaffe, University of Toronto, Dept. of Med Imaging, Toronto, ON M5S 1A1, Canada. Oncology - Osteosarcomas

Studies from University of Tsukuba Have Provided New Information about Osteosarcomas (Morphological and Mechanical Properties of Osteosarcoma Microenvironment Cells Explored by Atomic Force Microscopy)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Osteosarcomas have been published. According to news reporting out of Ibaraki, Japan, by NewsRx editors, research stated, "Cell mechanical properties that depend on cytoskeleton architecture are critical to the mechanotransduction process, and have great potential for cancer diagnosis and therapy. In this study, the morphological and mechanical properties of typical osteosarcoma microenvironment cells, including mesenchymal stem cells (MSC), normal human osteoblast cells (NHOst) and osteosarcoma cells (MG-63), were compared using atomic force microscopy (AFM)."

Our news journalists obtained a quote from the research from the University of Tsukuba, "The MG-63 cells were smaller and thicker than the MSC and NHOst cells. The membrane roughness of MG-63 cells was higher than that of MSC and NHOst cells. The MG-63 cells had lower stiffness than their normal counterparts due to their reduced organization of the cytoskeleton structure. The cell stiffness influenced the mechanotransduction. The MG-63 cells had a lower percentage of nuclear YAP/TAZ compared with the MSC and NHOst cells. The F-actin assembly was disrupted by the cytochalasin D (cyto D) treatment used to investigate its influence on mechanotransduction. Disruption of the cytoskeleton leaded to a decrease of the cell stiffness, and reduced the nuclear YAP/TAZ percentage, indicating its inhibition in the cell mechanotransduction process."

According to the news editors, the research concluded: "This study would shed light on the development of a novel cancer diagnosis strategy and would contribute to reveal the relationship between the cytoskeleton structure and the cell mechanical properties."

Our news journalists report that additional information may be obtained by contacting G.P. Chen, University of Tsukuba, Grad Sch Pure & Appl Sci, Dept. of Mat Sci & Engn, Tsukuba, Ibaraki 3058571, Japan. Additional authors for this research include Y.J. Yang, X.H. Hu, N. Kawazoe, Y.N. Yang and G.P. Chen.

Studies from University of Tübingen Update Current Data on Obstetrics and Gynecology (IRIS - An Internet Based Intervention as a Suitable Path to Addictive Substance Use Prevention and Counselling in Pregnancy? Beneficiary Profiles and User ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Women's Health - Obstetrics and
Gynecology. According to news reporting originating from Tubingen, Germany, by NewsRx correspondents, research stated, "Alcohol or tobacco consumption in pregnancy can harm the unborn child. Counselling on this subject is therefore of major importance."

Our news editors obtained a quote from the research from the University of Tubingen, "The aim of the presented study was not only to develop an internet based, professionally e-mail accompanied platform for alcohol or tobacco consuming pregnant women ('IRIS Platform') but also to analyse the beneficiary profiles and investigate the practicability and acceptance of the platform among women and referring gynaecologists. The offer comprised three 12-week counselling programmes (alcohol, tobacco, combined consumption). Altogether 32 women registered within the recruitment period of 20 weeks, only 9 of them at the suggestion of gynaecologists. Thirty were enrolled. The average age was 31 years. Ten women were pregnant for the first time, 14 unplanned. Most of them were smokers (n = 29). 75% (n = 12 of 16) of them had smoked in the previous pregnancies. 5 of 16 women had suffered miscarriages. Six women completed the entire 12 week programme. The abstinence rate after 3 months was min. 18.5% (ITT) in the tobacco group, while in the alcohol programme 3 women achieved abstinence. Satisfaction was reported especially for the eCoach initiative. The results demonstrate that an internet-based service like IRIS can be a useful form of support for tobacco or alcohol consuming pregnant women. A particular challenge is the accessibility of the persons concerned and the form in which alcohol consuming pregnant women are approached in daily medical practice."

According to the news editors, the research concluded: "The individual contact to the eCoach can be a decisive form of support and aid to motivation."

For more information on this research see: IRIS - An Internet Based Intervention as a Suitable Path to Addictive Substance Use Prevention and Counselling in Pregnancy? Beneficiary Profiles and User Satisfaction. Geburtshilfe Und Frauenheilkunde, 2016;76 (11):1163-1171. Geburtshilfe Und Frauenheilkunde can be contacted at: Georg Thieme Verlag Kg, Rudigerstr 14, D-70469 Stuttgart, Germany.

The news editors report that additional information may be obtained by contacting A. Stiegler, University of Tubingen, Univ Dept. of Psychiat & Psychotherapy, Sect Addict Med & Addict Res, D-72076 Tubingen, Germany. Additional authors for this research include H. Abele and A. Batra.

Oncology - Cutaneous T-Cell Lymphoma

Studies from University of Turin Add New Findings in the Area of Cutaneous T-Cell Lymphoma (Human Endogenous Retrovirus Expression in Primary Cutaneous T-Cell Lymphomas)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Cutaneous T-Cell Lymphoma is now available. According to news reporting originating in Turin, Italy, by NewsRx journalists, research stated, "Mycosis fungoides (MF) and Sézary syndrome (SS) are the most frequent cutaneous T-cell lymphomas (CTCL). Human endogenous retroviruses (HERVs) were reverse transcribed and
integrated into primate chromosomal DNA, becoming noninfectious, although various stimuli may reactivate them."

The news reporters obtained a quote from the research from the University of Turin, "HERV expression seems to be impaired in several human diseases but limited data regarding CTCL are available. To evaluate the endogenous retroviral transcription profile in CTCL and their expression among disease clinical stages. Peripheral blood mononuclear cells from 42 MF/SS patients were analyzed. Total RNA was extracted and amplified with reverse transcription polymerase chain reaction. Results were compared with those obtained in a cohort of 20 healthy donors. HERVs were significantly overexpressed in MF/SS patients compared with healthy donors. No differences were found between early and advanced CTCL stages. HERVs can act as promoters in MF/SS pathogenesis."

According to the news reporters, the research concluded: "It remains to link HERV hyperexpression to the outcome in CTCL patients."

Our news correspondents report that additional information may be obtained by contacting P. Fava, Section of Dermatology, Dept. of Medical Sciences, Medical School, University of Turin, Turin, Italy. Additional authors for this research include M. Bergallo, C. Astrua, M. Brizio, I. Galliano, P. Montanari, P.A. Tovo, M. Novelli, P. Savoia, P. Quaglino and M.T Fierro.

**Oncology - Breast Cancer**

**Studies from University of Udine Update Current Data on Breast Cancer (A Simple and Effective Technique of Breast Remodelling After Conserving Surgery for Lower Quadrants Breast Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting out of Udine, Italy, by NewsRx editors, research stated, "Quadrantectomy is an oncologically safe procedure for the treatment of early-stage breast cancer, but it often results in poor aesthetic outcomes such as breast shape deformity, which is more visible if the tumour is located in the lower pole. We recommend the use of the transverse incision, which retains the oncological advantages of the quadrantectomy while leading to better aesthetical results."

Our news journalists obtained a quote from the research from the University of Udine, "We evaluated the clinical results of 24 patients with breast cancer who underwent
quadrantectomy of the lower breast pole and volume replacement with remodelling through three posterior scorings from January 2012 to January 2014, with cosmetic evaluations performed according to the criteria set by the Japanese Breast Cancer Society. Minimum follow-up after surgery was 2 years, with an average of 28.4 months. Among treated patients, the percentage of complications was extremely low and the degree of satisfaction fairly good. Moreover, the assessment of the medical team matched patient self-assessments. Immediate breast reconstruction of a defect performed after a quadrantectomy of the lower breast pole using the 'posterior scoring technique' provided better cosmetic results compared to the transposition of residual breast tissue. This technique provides reliable and reproducible results, and it also appears to be rather successful on patients with small-moderate breasts in the absence of a certain degree of ptosis, therefore increasing its already considerable appeal. This journal requires that the authors assign a level of evidence to each article."

According to the news editors, the research concluded: "For a full description of these Evidence-Based Medicine ratings, please refer to the Table of Contents or the online Instructions to Authors www.springer.com/00266."

Our news journalists report that additional information may be obtained by contacting N. Zingaretti, University of Udine, Dept. of Plast & Reconstruct Surg, Breast Unit, Osped S Maria Misericordia, I-33100 Udine, Italy. Additional authors for this research include N. Zingaretti, A. Marchesi, L. Vaienti, D. Almesberger and P.C. Parodi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s00266-016-0709-7. This DOI is a link to an online electronic document that is either free or for purchase.

Central Nervous System Diseases and Conditions

Studies from University of Utah Yield New Information about Epilepsy (Transcranial magnetic stimulation for the treatment of epilepsy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Central Nervous System Diseases and Conditions - Epilepsy are presented in a new report. According to news reporting originating in Salt Lake City, Utah, by NewsRx journalists, research stated, "Epilepsy is a highly prevalent neurological condition characterized by repeated unprovoked seizures with various etiologies. Although antiepileptic medications produce clinical improvement in most individuals, nearly a third of individuals have drug-resistant epilepsy that carries significant morbidity and mortality."

The news reporters obtained a quote from the research from the University of Utah, "There remains a need for non-invasive and more effective therapies for this population. Transcranial magnetic stimulation (TMS) uses electromagnetic coils to excite or inhibit neurons, with repetitive pulses at low-frequency producing an inhibitory effect that could conceivably..."
reduce cortical excitability associated with epilepsy. To assess the evidence for the use of TMS in individuals with drug-resistant epilepsy compared with other available treatments in reducing seizure frequency, improving quality of life, reducing epileptiform discharges, antiepileptic medication use, and side-effects. Search methods We searched the Cochrane Epilepsy Group Specialized Register, the Cochrane Central Register of Controlled Trials (CENTRAL) via the Cochrane Register of Studies Online (CRSO), MEDLINE (Ovid 1946 to 10 March 2016), ClinicalTrials.gov and the World Health Organization International Clinical Trials Registry Platform (ICTRP) up to March 2016. We also searched SCOPUS (1823 to June 2014) as a substitute for Embase (but it is no longer necessary to search SCOPUS, because randomized controlled trials (RCTs) and quasi-RCTs in EMBASE are now included in CENTRAL).

Selection criteria Eligible studies were RCTs that were double-blinded, single-blinded or unblinded, and placebo, no treatment, or active controlled, which used repetitive transcranial magnetic stimulation (rTMS) without restriction of frequency, duration, intensity, or setup (focal or vertex treatment) on patients with drug-resistant epilepsy. The search revealed 274 records from the databases, that after selection provided seven full-text relevant studies for inclusion. Of the seven studies included, five were completed studies with published data and included randomized, blinded trials. The total number of participants in the seven trials was 230. Data collection and analysis We extracted information from each trial including methodological data; participant demographics including baseline seizure frequency, type of epileptic drugs taken; intervention details and intervention groups for comparison; potential biases; and outcomes and time points, primarily change in seizure frequency or responder rates, as well as quality of life and epileptiform discharges, adverse effects, and changes in medication use. Two of the seven studies analyzed showed a statistically significant reduction in seizure rate from baseline (72% and 78.9% reduction of seizures per week from the baseline rate, respectively). The other five studies showed no statistically significant difference in seizure frequency following rTMS treatment compared with controls. We were not able to combine the results of the trials in analysis due to differences in the designs of the studies. Four studies evaluated our secondary endpoint of mean number of epileptic discharges, and three of the four showed a statistically significant reduction in discharges. Quality of life was not assessed in any of the studies. Adverse effects were uncommon among the studies and typically involved headache, dizziness, and tinnitus. No significant changes in medication use were found in the trials. Authors' conclusions Overall, we judged the quality of evidence for the primary outcomes of this review to be low."

According to the news reporters, the research concluded: "There is evidence that rTMS is safe and not associated with any adverse events, but given the variability in technique and outcome reporting that prevented meta-analysis, the evidence for efficacy of rTMS for seizure reduction is still lacking despite reasonable evidence that it is effective at reducing epileptiform discharges."

For more information on this research see: Transcranial magnetic stimulation for the treatment of epilepsy. Cochrane Database of Systematic Reviews, 2016;(8):1693-1727. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Studies from University of Utah in the Area of Science Described (A cloud-based workflow to quantify transcript-expression levels in public cancer compendia)

2017 JAN 14 (NewsRx) -- A new study on Science is now available. According to news reporting originating in Salt Lake City, Utah, by NewsRx journalists, research stated, "Public compendia of sequencing data are now measured in petabytes. Accordingly, it is infeasible for researchers to transfer these data to local computers."

The news reporters obtained a quote from the research from the University of Utah, "Recently, the National Cancer Institute began exploring opportunities to work with molecular data in cloud-computing environments. With this approach, it becomes possible for scientists to take their tools to the data and thereby avoid large data transfers. It also becomes feasible to scale computing resources to the needs of a given analysis. We quantified transcript-expression levels for 12,307 RNA-Sequencing samples from the Cancer Cell Line Encyclopedia and The Cancer Genome Atlas. We used two cloud-based configurations and examined the performance and cost profiles of each configuration. Using preemptible virtual machines, we processed the samples for as little as $0.09 (USD) per sample. As the samples were processed, we collected performance metrics, which helped us track the duration of each processing step and quantified computational resources used at different stages of sample processing. Although the computational demands of reference alignment and expression quantification have decreased considerably, there remains a critical need for researchers to optimize preprocessing steps."

According to the news reporters, the research concluded: "We have stored the software, scripts, and processed data in a publicly accessible repository (https://osf.io/gqrz9)."

For more information on this research see: A cloud-based workflow to quantify transcript-expression levels in public cancer compendia. Scientific Reports, 2016;6():1-10. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Studies from University of Valencia Yield New Data on Pharmacotherapy (Neurochemical substrates of the rewarding effects of MDMA: implications for the development of pharmacotherapies to MDMA dependence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Pharmacotherapy. According to news reporting originating in Valencia, Spain, by NewsRx journalists, research stated, "In recent years, studies with animal models of reward, such as the intracranial self-stimulation, self-administration, and conditioned place preference paradigms, have increased our knowledge on the neurochemical substrates of the rewarding effects of 3,4-methylenedioxymetamphetamine (MDMA) in rodents. However, pharmacological and neuroimaging studies with human participants are scarce."

The news reporters obtained a quote from the research from the University of Valencia, "Serotonin [5-hydroxytryptamine (5-HT)], dopamine (DA), endocannabinoids, and endogenous opiates are the main neurotransmitter systems involved in the rewarding effects of MDMA in rodents, but other neurotransmitters such as glutamate, acetylcholine, adenosine, and neotensin are also involved. The most important finding of recent research is the demonstration of differential involvement of specific neurotransmitter receptor subtypes (5-HT2, 5-HT3, DA D1, DA D2, CB1, m and d opioid, etc.) and extracellular proteins (DA and 5-HT transporters) in the acquisition, expression, extinction, and reinstatement of MDMA self-administration and conditioned place preference. It is important to extend the research on the effects of different compounds acting on these receptors/transporters in animal models of reward, especially in priming-induced, cue-induced, and stress-induced reinstatement."

According to the news reporters, the research concluded: "Increase in knowledge of the neurochemical substrates of the rewarding effects of MDMA may contribute to the design of new pharmacological treatments for individuals who develop MDMA dependence."

For more information on this research see: Neurochemical substrates of the rewarding effects of MDMA: implications for the development of pharmacotherapies to MDMA dependence. Studies from University of Vienna Yield New Information about Acute Lung Injury (The total alkaloid fraction of bulbs of Fritillaria cirrhosa displays anti-inflammatory activity and attenuates acute lung injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Lung Diseases and Conditions - Acute Lung Injury are discussed in a new report. According to news reporting from Vienna, Austria, by NewsRx journalists, research stated, "Ethnopharmacological relevance: Bulb of Fritillaria cirrhosa D.Don (BFC) has been wildly used in China for a long time for folk medicine since its significant therapeutic effects on respiratory diseases, such as cough, expectoration, pneumonia and bronchial inflammation, which are related to respiratory inflammatory response. However, there is a lack of investigation on the in vivo anti-inflammatory properties of BFC."

Funders for this research include Technological Platform of Detection of Quality and Safety and Risk Controlling of Chinese Medicine, China Scholarship Council, University of Vienna.

The news correspondents obtained a quote from the research from the University of Vienna, "Aim of the study: The aim of this study was to evaluate the in vivo anti-inflammatory activity of the purified total alkaloid fraction of BFC (TAF) by using different animal models of inflammation to provide scientific evidence for its traditional use. The total alkaloid fraction from BFC was prepared by using H-103 resin column. Anti-inflammatory effect of TAF was evaluated by models of acetic acid-induced capillary permeability accentuation, carrageenan-induced rat paw edema, cotton pellet-induced granuloma formation and LPS-induced acute lung injury (ALI). The level of cytokines (TNF, IL-6, IL-4 and IL-10) was measured by ELISA. Histopathological analyses were performed by using hematoxylin and eosin staining. TAF can inhibit acetic acid-induced capillary permeability accentuation, carrageenan-induced paw edema, cotton pellet-induced granuloma formation, suppress inflammatory cells recruitment and cytokine production in the bronchoalveolar lavage fluid from LPS-induced ALI mice, and attenuate pathological changes in the lung tissues of ALI mice."

According to the news reporters, the research concluded: "This study provides scientific evidence for bulb of F. cirrhosa to treat respiratory inflammation."

Our news journalists report that additional information may be obtained by contacting D.D. Wang, University of Vienna, Dept. of Pharmacognosy, Fac Life Sci, A-1090 Vienna, Austria. Additional authors for this research include J. Yang, Q.D. Du, H.C. Li and S. Wang.

Studies from University of Virginia Reveal New Findings on Retinitis Pigmentosa [Palmitoylation of Progressive Rod-Cone Degeneration (PRCD) Regulates Protein Stability and Localization]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Eye Diseases and Conditions - Retinitis Pigmentosa. According to news originating from Morgantown, West Virginia, by NewsRx correspondents, research stated, "Progressive rod-cone degeneration (PRCD) is a photoreceptor outer segment (OS) disc-specific protein with unknown function that is associated with retinitis pigmentosa (RP). The most common mutation in PRCD linked with severe RP phenotype is substitution of the only cysteine to tyrosine (C2Y)."

Financial support for this research came from West Virginia University.

Our news journalists obtained a quote from the research from the University of Virginia, "In this study, we find that PRCD is post-translationally modified by a palmitoyl lipid group at the cysteine residue linked with RP. Disrupting PRCD palmitoylation either chemically or by genetically eliminating the modified cysteine dramatically affects the stability of PRCD. Furthermore, in vivo electroporation of PRCD C2Y mutant in the mouse retina demonstrates that the palmitoylation of PRCD is important for its proper localization in the photoreceptor OS. Mutant PRCD C2Y was found in the inner segment in contrast to normal localization of WTPRCD in the OS. Our results also suggest that zDHHC3, a palmitoyl acyltransferase (PAT), catalyzes the palmitoylation of PRCD in the Golgi compartment."

According to the news editors, the research concluded: "We find that the palmitoylation of PRCD is crucial for its trafficking to the photoreceptor OS and mislocalization of this protein likely leads to RP-related phenotypes."

The news correspondents report that additional information may be obtained from S. Kolandaivelu, West Virginia Univ, Inst Eye, Dept. of Ophthalmol, Morgantown, WV 26506, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1074/jbc.M116.742767. This DOI is a link to an online electronic document that is either free or for purchase.

Graphical Models

Studies from University of Virginia in the Area of Graphical Models Reported (Identifying gene regulatory network rewiring using latent differential graphical models)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Graphical Models are discussed in a new report. According to news reporting from Charlottesville, Virginia, by NewsRx journalists, research stated, "Gene regulatory networks (GRNs) are highly dynamic among different tissue types. Identifying tissue-specific gene regulation is critically important to understand gene function in a particular cellular context."

The news correspondents obtained a quote from the research from the University of Virginia, "Graphical models have been used to estimate GRN from gene expression data to distinguish direct interactions from indirect associations. However, most existing methods estimate GRN for a specific cell/tissue type or in a tissue-naive way, or do not specifically focus on network rewiring between different tissues. Here, we describe a new method called Latent Differential Graphical Model (LDGM). The motivation of our method is to estimate the differential network between two tissue types directly without inferring the network for individual tissues, which has the advantage of utilizing much smaller sample size to achieve reliable differential network estimation. Our simulation results demonstrated that LDGM consistently outperforms other Gaussian graphical model based methods. We further evaluated LDGM by applying to the brain and blood gene expression data from the GTEx consortium. We also applied LDGM to identify network rewiring between cancer subtypes using the TCGA breast cancer samples."

According to the news reporters, the research concluded: "Our results suggest that LDGM is an effective method to infer differential network using high-throughput gene expression data to identify GRN dynamics among different cellular conditions."

Our news journalists report that additional information may be obtained by contacting Q.Q. Gu, University of Virginia, Dept. of Syst & Informat Engn, Charlottesville, VA 22904, United States. Additional authors for this research include Q.Q. Gu and J. Ma.

Transplant Medicine - Cell Transplants

Studies from University of Washington Describe New Findings in Cell Transplants (Up-to-date tools for risk assessment before allogeneic hematopoietic cell transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transplant Medicine - Cell Transplants have been published. According to news originating from Seattle, Washington, by NewsRx correspondents, research stated, "Cure of malignant and non-malignant hematological diseases is potentially possible after allogeneic hematopoietic stem cell transplantation (HCT). Accurate evaluation of the risk-benefit ratio for an individual patient could improve the decision-making process about transplant, which ultimately would increase the likelihood of success."

Our news journalists obtained a quote from the research from the University of Washington, "Several transplant-related models were designed in an effort to optimize decision-making about suitable candidates for allogeneic HCT. In 1998, The European Society for Blood and Marrow Transplantation (EBMT) developed a five-component pretransplantation risk scoring system for patients with CML. The EBMT score was later tested in patients with various hematological disorders, and it was shown to stratify risks of mortality after allogeneic HCT. More recent research efforts focused on models that assess health status before HCT. A HCT-specific comorbidity index was designed to assign weights to 17 relevant comorbidities that were shown to independently predict nonrelapse mortality. Performance status scales and comprehensive geriatric assessment tools might uncover additional overall health limitations that affect long-term survival among older recipients of allogeneic HCT. Other models include the pretransplantation assessment of mortality score that summarizes the impacts of eight different pretransplantation patient-and disease-specific variables into a 50-point model that predicts survival. The disease-risk index captures the impact of primary diagnoses and disease status on relapse and survival following allogeneic HCT. The values and limitations of each model are discussed herein."

According to the news editors, the research concluded: "We also provide insight on how to use these models in the clinic to decide about offering allogeneic HCT with the most suitable conditioning regimen intensity."

For more information on this research see: Up-to-date tools for risk assessment before allogeneic hematopoietic cell transplantation. *Bone Marrow Transplantation, 2016;51 (10):1283-1300. Bone Marrow Transplantation* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Studies from University of Washington Provide New Data on Atrial Fibrillation (New perspectives on atrial fibrillation and stroke)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting originating in Seattle, Washington, by NewsRx editors, the research stated, "Atrial fibrillation (AF) is directly implicated in embolic stroke and suspected in a large proportion of cryptogenic stroke. The current stroke-prevention strategy in embolic and cryptogenic stroke starts with arrhythmia detection, followed by risk stratification and treatment for those deemed to be at increased risk."

The news reporters obtained a quote from the research from the University of Washington, "This approach is practical and widespread; however, more recent findings have questioned its validity. Arrhythmia detection is dependent on the length and fidelity of monitoring. Long-term monitoring using implanted recorders improves arrhythmia detection in patients with cryptogenic stroke. A large proportion of patients with cryptogenic stroke, however, were shown not to have any AF. Moreover, in patients with permanent pacemakers who also experienced thromboembolic events, AF did not always precede thromboembolisation. These results raise cause and effect questions about the role of AF, the arrhythmia, in thrombus formation and embolisation. Moreover, risk estimation scores; such as Congestive heart failure, Hypertension, Age, Diabetes and previous Stroke or Transient Ischaemic Attack, Vascular disease and female sex category (CHA(2)DS(2)-VASc), have a suboptimal predictive accuracy and the mechanism relating their individual components to thrombogenesis is unknown. Given these limitations, a more comprehensive and mechanistic evaluation of atrial disease is needed to better identify patients at risk for stroke and AF. Atrial fibrosis, quantified using late gadolinium enhancement cardiac MRI, is associated with reduced atrial function, stroke and the presence of left atrial thrombus in patients with AF."

According to the news reporters, the research concluded: "Biomarkers such as B-type natriuretic peptide, cardiac troponin have also been linked to increased thromboembolic risk and AF."

For more information on this research see: New perspectives on atrial fibrillation and stroke. *Heart*, 2016;102(22):1788-1792. *Heart* can be contacted at: Bmj Publishing Group, British Med Assoc House, Tavistock Square, London WC1H 9JR, England. Oncology - Carcinomas

Studies from University of Washington Provide New Data on Carcinomas (Neoplastic cellularity is associated with clinical and molecular features of high-grade serous ovarian carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Carcinomas have been published. According to news originating from Seattle, Washington, by NewsRx correspondents, research stated, "Most molecular analyses of high-grade serous ovarian, peritoneal and fallopian tube carcinomas (HGSC) require >= 70% tumor (neoplastic) cell nuclei. We characterized the distribution of the percentage of neoplastic nuclei (PNN) in a large cohort of HGSC and correlated PNN with clinical outcomes to determine the fraction of cases outside this range and whether this cut-off introduces selection bias."

Our news journalists obtained a quote from the research from the University of Washington, "Subjects were prospectively enrolled and normal and neoplastic tissues were snap-frozen. All subjects had grade 2 to 3 HGSC. Subjects that received neoadjuvant chemotherapy were excluded. PNN was determined by estimating the fraction of neoplastic nuclei relative to non-neoplastic nuclei on a representative hematoxylin and eosin stained frozen section from the primary neoplasm. Germline BRCA mutation status was determined with Sanger or BROCA sequencing. PNN was <70% in 101 (33%) of 306 cases. PNN was significantly higher among subjects without optimal cytoreduction (P = 0.018). 55 subjects had germline BRCA1/BRCA2 mutations. HGSC associated with BRCA2 but not BRCA1 mutations had significantly lower PNN compared to HGSC in non-carriers (54% vs. 70%, P = 0.018). Overall survival was not significantly different between subjects with <70% or >= 70% PNN (median survival 51.8 vs. 46.6 months, P = 0.858). One-third of HGSC has PNN <70%. Higher PNN is associated with suboptimal cytoreduction, while lower PNN is associated with inherited BRCA2 mutations. Our findings suggest a nonrandom distribution of PNN that may reflect cancer biology. Further studies exploring the stromal microenvironment are needed."

According to the news editors, the research concluded: "Molecular analyses of HGSC selected for high PNN exclude a significant fraction of patients."

Cardiovascular Diseases and Conditions - Venous ...

Studies from University of Washington Update Current Data on Venous Thromboembolism (Preventing Hospital-Acquired Venous Thromboembolism: Improving Patient Safety With Interdisciplinary Teamwork, Quality Improvement Analytics, and Data ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Venous Thromboembolism. According to news reporting from Seattle, Washington, by NewsRx journalists, research stated, "Hospital-acquired venous thromboembolism (HA-VTE) is a potentially preventable cause of morbidity and mortality. Despite high rates of venous thromboembolism (VTE) prophylaxis in accordance with an institutional guideline, VTE remains the most common hospital-acquired condition in our institution."

The news correspondents obtained a quote from the research from the University of Washington, "To improve the safety of all hospitalized patients, examine current VTE prevention practices, identify opportunities for improvement, and decrease rates of HA-VTE. Pre/post assessment. Urban academic tertiary referral center, level 1 trauma center, safety net hospital; all patients. We formed a multidisciplinary VTE task force to review all HA-VTE events, assess prevention practices relative to evidence-based institutional guidelines, and identify improvement opportunities. The task force developed an electronic tool to facilitate efficient VTE event review and designed decision-support and reporting tools, now integrated into the electronic health record, to bring optimal VTE prevention practices to the point of care. Performance is shared transparently across the institution. Harborview benchmarks process and outcome performance, including patient safety indicators and core measures, against hospitals nationally using Hospital Compare and Vizient data. Our program has resulted in >90% guideline-adherent VTE prevention and zero preventable HA-VTEs. Initiatives have resulted in a 15% decrease in HA-VTE and a 21% reduction in postoperative VTE. Keys to success include the multidisciplinary approach, clinical roles of task force members, senior leadership support, and use of quality improvement analytics for retrospective review, prospective reporting, and performance transparency."

According to the news reporters, the research concluded: "Ongoing task force collaboration with frontline providers is critical to sustained improvements."

Our news journalists report that additional information may be obtained by contacting A.M. Schleyer, University of Washington, Harborview Med Center, Dept. of Med, Seattle, WA 98104, United States. **DNA Research**

**Studies from University of Washington in the Area of DNA Research Described (Biomarkers of Response and Resistance to DNA Repair Targeted Therapies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on DNA Research. According to news originating from Seattle, Washington, by NewsRx correspondents, research stated, "Drugs targeting DNA damage repair (DDR) pathways are exciting new agents in cancer therapy. Many of these drugs exhibit synthetic lethality with defects in DNA repair in cancer cells."

Our news journalists obtained a quote from the research from the University of Washington, "For example, ovarian cancers with impaired homologous recombination DNA repair show increased sensitivity to poly(ADP-ribose) polymerase (PARP) inhibitors. Understanding the activity of different DNA repair pathways in individual tumors, and the correlations between DNA repair function and drug response, will be critical to patient selection for DNA repair targeted agents. Genomic and functional assays of DNA repair pathway activity are being investigated as potential biomarkers of response to targeted therapies. Furthermore, alterations in DNA repair function generate resistance to DNA repair targeted agents, and DNA repair states may predict intrinsic or acquired drug resistance. In this review, we provide an overview of DNA repair targeted agents currently in clinical trials and the emerging biomarkers of response and resistance to these agents: genetic and genomic analysis of DDR pathways, genomic signatures of mutational processes, expression of DNA repair proteins, and functional assays for DNA repair capacity. We review biomarkers that may predict response to selected DNA repair targeted agents, including PARP inhibitors, inhibitors of the DNA damage sensors ATM and ATR, and inhibitors of nonhomologous end joining. Finally, we introduce emerging categories of drugs targeting DDR and new strategies for integrating DNA repair targeted therapies into clinical practice, including combination regimens."

According to the news editors, the research concluded: "Generating and validating robust biomarkers will optimize the efficacy of DNA repair targeted therapies and maximize their impact on cancer treatment."

For more information on this research see: Biomarkers of Response and Resistance to DNA Repair Targeted Therapies. *Clinical Cancer Research*, 2016;22(23):5651-5660. *Clinical Cancer Research* can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Studies from University of Western Australia in the Area of Blood Pressure Reported (Effect of omega-3 fatty acid supplementation on arterial elasticity in patients with familial hypercholesterolaemia on statin therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Blood Pressure. According to news reporting originating in Perth, Australia, by NewsRx journalists, research stated, "Increased arterial stiffness is closely linked with raised blood pressure that contributes substantially to enhanced risk of coronary heart disease in high risk individuals with familial hypercholesterolaemia (FH). Omega-3 fatty acid (omega 3-FA) supplementation has been demonstrated to lower blood pressure in subjects with a high cardiovascular disease risk."

Financial support for this research came from National Health Medical Research Council of Australia.

The news reporters obtained a quote from the research from the University of Western Australia, "Whether omega 3-FA supplementation improves arterial stiffness in FH subjects, on background statin therapy, has yet to be investigated. We carried out an 8-week randomized, crossover intervention trial to test the effect of 4 g/d omega 3-FA supplementation (46% eicosapentaenoic acid and 38% docosahexaenoic acid) on arterial elasticity in 20 adults with FH on optimal cholesterol-lowering therapy. Large and small artery elasticity were measured by pulse contour analysis of the radial artery. omega 3-FA supplementation significantly (P < 0.05 in all) increased large artery elasticity (+9%) and reduced systolic blood pressure (-6%) and diastolic blood pressure (-6%), plasma triglycerides (-20%), apoB concentration (-8%). In contrast, omega 3-FA had no significant effect on small artery elasticity. The change in large artery elasticity was not significantly associated with changes in systolic blood pressure or plasma triglyceride concentration."

According to the news reporters, the research concluded: "Omega 3-FA supplementation improves large arterial elasticity and arterial blood pressure independent of statin therapy in adults with FH."

For more information on this research see: Effect of omega-3 fatty acid supplementation on arterial elasticity in patients with familial hypercholesterolaemia on statin therapy. *Nutrition Metabolism and Cardiovascular Diseases*, 2016;26(12):1140-1145. *Nutrition Metabolism and Cardiovascular Diseases* can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England.

Studies from University of Western Ontario Have Provided New Data on Hypercholesterolemia (Polygenic Versus Monogenic Causes of Hypercholesterolemia Ascertained Clinically)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Hypercholesterolemia. According to news reporting out of London, Canada, by NewsRx editors, research stated, "Next-generation sequencing technology is transforming our understanding of heterozygous familial hypercholesterolemia, including revision of prevalence estimates and attribution of polygenic effects. Here, we examined the contributions of monogenic and polygenic factors in patients with severe hypercholesterolemia referred to a specialty clinic."

Our news journalists obtained a quote from the research from the University of Western Ontario, "Approach and Results-We applied targeted next-generation sequencing with custom annotation, coupled with evaluation of large-scale copy number variation and polygenic scores for raised low-density lipoprotein cholesterol in a cohort of 313 individuals with severe hypercholesterolemia, defined as low-density lipoprotein cholesterol >5.0 mmol/L (>194 mg/dL). We found that (1) monogenic familial hypercholesterolemia-causing mutations detected by targeted next-generation sequencing were present in 47.3% of individuals; (2) the percentage of individuals with monogenic mutations increased to 53.7% when copy number variations were included; (3) the percentage further increased to 67.1% when individuals with extreme polygenic scores were included; and (4) the percentage of individuals with an identified genetic component increased from 57.0% to 92.0% as low-density lipoprotein cholesterol level increased from 5.0 to >8.0 mmol/L (194 to >310 mg/dL)."

According to the news editors, the research concluded: "In a clinically ascertained sample with severe hypercholesterolemia, we found that most patients had a discrete genetic basis detected using a comprehensive screening approach that includes targeted next-generation sequencing, an assay for copy number variations, and polygenic trait scores."

For more information on this research see: Polygenic Versus Monogenic Causes of Hypercholesterolemia Ascertained Clinically. Arteriosclerosis Thrombosis and Vascular Biology, 2016;36(12):2439-2445. **Drugs and Therapies - Cancer Therapy**

**Studies from University of Western Sydney Update Current Data on Cancer Therapy (Transition Metal Intercalators as Anticancer Agents-Recent Advances)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Cancer Therapy have been presented. According to news originating from Campbelltown, Australia, by NewsRx correspondents, research stated, "The diverse anticancer utility of cisplatin has stimulated significant interest in the development of additional platinum-based therapies, resulting in several analogues receiving clinical approval worldwide. However, due to structural and mechanistic similarities, the effectiveness of platinum-based therapies is countered by severe side-effects, narrow spectrum of activity and the development of resistance."

Our news journalists obtained a quote from the research from the University of Western Sydney, "Nonetheless, metal complexes offer unique characteristics and exceptional versatility, with the ability to alter their pharmacology through facile modifications of geometry and coordination number. This has prompted the search for metal-based complexes with distinctly different structural motifs and non-covalent modes of binding with a primary aim of circumventing current clinical limitations. This review discusses recent advances in platinum and other transition metal-based complexes with mechanisms of action involving intercalation. This mode of DNA binding is distinct from cisplatin and its derivatives."

According to the news editors, the research concluded: "The metals focused on in this review include Pt, Ru and Cu along with examples of Au, Ni, Zn and Fe complexes; these complexes are capable of DNA intercalation and are highly biologically active."

For more information on this research see: Transition Metal Intercalators as Anticancer Agents-Recent Advances. *International Journal of Molecular Sciences*, 2016;17 (11):885-901. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

The news correspondents report that additional information may be obtained from K.M. Deo, University of Western Sydney, Sch Sci & Hlth, Campbelltown, NSW 2560, Australia. Additional authors for this research include B.J. Pages, D.L. Ang, C.P. Gordon and J.R. Aldrich-Wright.

Studies from University of Witwatersrand in the Area of beta-Lactams Reported (Molecular detection of carbapenemase-producing genes in referral Enterobacteriaceae in South Africa: A short report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on beta-Lactams are discussed in a new report. According to news reporting out of Johannesburg, South Africa, by NewsRx editors, research stated, "Molecular confirmation of carbapenemase-producing Enterobacteriaceae (CPE) was introduced in South Africa (SA) at the end of 2011. We report on the detection of these resistance genes based on referral isolates."

Our news journalists obtained a quote from the research from the University of Witwatersrand, "Enterobacteriaceae with non-susceptibility to any of the carbapenems according to defined criteria for antimicrobial susceptibility testing results were sent to a reference laboratory. A proportion of isolates had limited demographic, epidemiological and clinical data available. Organism identification was reconfirmed using reference laboratory methods, and the presence of carbapenemases was confirmed with a real-time polymerase chain reaction. We analysed 1 503 significant isolates received for confirmation from the National Health Laboratory Service and some private laboratories during 2012-2015 and confirmed one or more carbapenemase-producing genes in 68% of isolates, the most common organism being Klebsiella pneumoniae (60%). The most common carbapenemase genes were bla(NDM), followed by bla(OXA-48) and its variants. Bla(OXA-48) and its variants demonstrated non-susceptibility to ertapenem in 89% of the isolates when analysed by the phenotypic method, and to ceftazidime in 34%. Overall, the detection rate for carbapenemases in K. pneumoniae blood isolates in the public sector was 1.9% during the 4-year period."

According to the news editors, the research concluded: "This report indicates the presence of CPE in SA, and it is important for all healthcare workers to be aware of this major public health threat so that infection prevention and control measures can be implemented to prevent the spread of CPE in healthcare facilities."

For more information on this research see: Molecular detection of carbapenemase-producing genes in referral Enterobacteriaceae in South Africa: A short report. SAMJ South African Medical Journal, 2016;106(10):41-43. SAMJ South African Medical Journal can be contacted at: Sa Medical Assoc, Block F Castle Walk Corporate Park, Nossob Street, Erasmushoop EXT3, Pretoria, 0002, South Africa.

Drugs and Therapies - Toxicology and Pharmacology

Studies from University of Wurzburg in the Area of Toxicology and Pharmacology Reported (Assessment of reproductive and developmental effects of DINP, DnHP and DCHP using quantitative weight of evidence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Toxicology and Pharmacology have been published. According to news reporting originating in Wurzburg, Germany, by NewsRx journalists, research stated, "Quantitative weight of evidence (QWoE) methodology utilizes detailed scoring sheets to assess the quality/reliability of each publication on toxicity of a chemical and gives numerical scores for quality and observed toxicity. This QWoE-methodology was applied to the reproductive toxicity data on diisononylphthalate (DINP), di-n-hexylphthalate (DnHP), and dicyclohexylphthalate (DCHP) to determine if the scientific evidence for adverse effects meets the requirements for classification as reproductive toxicants."

The news reporters obtained a quote from the research from the University of Wurzburg, "The scores for DINP were compared to those when applying the methodology DCHP and DnHP that have harmonized classifications. Based on the quality/reliability scores, application of the QWoE shows that the three databases are of similar quality; but effect scores differ widely. Application of QWoE to DINP studies resulted in an overall score well below the benchmark required to trigger classification. For DCHP, the QWoE also results in low scores. The high scores from the application of the QWoE methodology to the toxicological data for DnHP represent clear evidence for adverse effects and justify a classification of DnHP as category 1B for both development and fertility."

According to the news reporters, the research concluded: "The conclusions on classification based on the QWoE are well supported using a narrative assessment of consistency and biological plausibility."

For more information on this research see: Assessment of reproductive and developmental effects of DINP, DnHP and DCHP using quantitative weight of evidence. Regulatory Toxicology and Pharmacology, 2016;81():397-406. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Autoimmune Diseases and Conditions - Psoriatic…**

**Studies from University of York Describe New Findings in Psoriatic Arthritis (A discrete choice experiment to explore patients' willingness to risk disease relapse from treatment withdrawal in psoriatic arthritis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Autoimmune Diseases and Conditions - Psoriatic Arthritis is now available. According to news reporting originating from York, United Kingdom, by NewsRx correspondents, research stated, "The objective of this study is to assess patient preferences for treatment-related benefits and risk of disease relapse in the management of low disease states of psoriatic arthritis (PsA). Focus groups with patients and a literature review were undertaken to determine the characteristics of treatment and symptoms of PsA important to patients."

Our news editors obtained a quote from the research from the University of York, "Patient preferences were assessed using a discrete choice experiment which compared hypothetical treatment profiles of the risk and benefits of treatment withdrawal. The risk outcome included increased risk of disease relapse, while benefit outcomes included reduced sickness/nausea from medication and changes in health-related quality of life. Each patient completed 12 choice sets comparing treatment profiles. Preference weights were estimated using a logic regression model, and the maximum acceptable risk in disease relapse for a given improvement in benefit outcomes was elicited. Final sample included 136 patients. Respondents attached the greatest importance to eliminating severe side effects of sickness/nausea and the least importance to a change in risk of relapse. Respondents were willing to accept an increase in the risk of relapse of 32.6 % in order to eliminate the side effects of sickness/nausea. For improvements in health status, the maximum acceptable risk in relapse was comparable to a movement from some to no sickness/nausea."

According to the news editors, the research concluded: "The study suggests that patients in low disease states of PsA are willing to accept greater risks of relapse for improvements in side effects of sickness/nausea and overall health status, with the most important benefit attribute being the elimination of severe sickness or nausea."

For more information on this research see: A discrete choice experiment to explore patients' willingness to risk disease relapse from treatment withdrawal in psoriatic arthritis. *Clinical Rheumatology*, 2016;35(12):2967-2974. *Clinical Rheumatology* can be contacted at: Springer London Ltd, 236 Grays Inn Rd, 6TH Floor, London WC1X 8HL, England. Studies from University of Zurich Provide New Data on Aneurysm (Safety and effectiveness of large volume coils in the treatment of small aneurysms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Aneurysm have been published. According to news reporting originating in Zurich, Switzerland, by NewsRx journalists, research stated, "Large volume soft design coils facilitate quicker aneurysm filling and high packing density. Our purpose was to analyze the feasibility, safety, and effectiveness of the Penumbra Coil 400 (PC400) system in the treatment of small aneurysms."

The news reporters obtained a quote from the research from the University of Zurich, "A retrospective analysis of prospective data collected at three different centers was performed on consecutive aneurysms <10 mm treated with the PC400 system. A total of 92 aneurysms were included in the study. Feasibility, procedure safety, angiographic and clinical results, and follow-up results were evaluated. Mean aneurysm size was 5.8 +/- 2.0 mm. An average of 2.5 +/- 1.3 coils with a mean length of 18 +/- 16 cm per aneurysm was used, resulting in a mean packing density of 45.6 +/- 14.4%. The thromboembolic event rate was 3.3% and no procedural aneurysm rupture was observed. Immediate adequate occlusion was achieved in 66% of aneurysms. During a mean follow-up period of 7.4 months the number of adequate occlusions increased to 91%. Large volume PC 400 coils are safe and effective in the treatment of small aneurysms with a low thromboembolic complication rate and no hemorrhagic events. High packing densities are achieved with a low average number of coils used per aneurysm treated."

According to the news reporters, the research concluded: "The aneurysms demonstrated progressive occlusion over time, which probably suggests stability in the long term."

Our news correspondents report that additional information may be obtained by contacting Z. Kulcsar, University of Zurich, Intervent Work Res, CABMM, Zurich, Switzerland. Additional authors for this research include I. Wanke, D. Rufenacht, S.G. Wetzel, S. Goricke, K. Kolia, S. Quarfordt, J. Calvert, H. Hawk and B. Baxter.

Gram-Positive Bacteria - Staphylococcus aureus

Studies from University of Zurich in the Area of Staphylococcus aureus Described (Modulation of Staphylococcus aureus Biofilm Matrix by Subinhibitory Concentrations of Clindamycin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Gram-Positive Bacteria - Staphylococcus aureus is the subject of a report. According to news originating from Zurich, Switzerland, by NewsRx correspondents, research stated, "Staphylococcus aureus biofilms are extremely difficult to treat. They provide a protected niche for the bacteria, rendering them highly recalcitrant toward host defenses as well as antibiotic treatment."

Our news journalists obtained a quote from the research from the University of Zurich, "Bacteria within a biofilm are shielded from the immune system by the formation of an extracellular polymeric matrix, composed of polysaccharides, extracellular DNA (eDNA), and proteins. Many antibiotics do not readily penetrate biofilms, resulting in the presence of subinhibitory concentrations of antibiotics. Here, we show that subinhibitory concentrations of clindamycin triggered a transcriptional stress response in S. aureus via the alternative sigma factor B (sigma(B)) and upregulated the expression of the major biofilm-associated genes atlA, lrgA, agrA, the psm genes, fnbA, and fnbB. Our data suggest that subinhibitory concentrations of clindamycin alter the ability of S. aureus to form biofilms and shift the composition of the biofilm matrix toward higher eDNA content."

According to the news editors, the research concluded: "An understanding of the molecular mechanisms underlying biofilm assembly and dispersal in response to subinhibitory concentrations of clinically relevant antibiotics such as clindamycin is critical to further optimize antibiotic treatment strategies of biofilm-associated S. aureus infections."

For more information on this research see: Modulation of Staphylococcus aureus Biofilm Matrix by Subinhibitory Concentrations of Clindamycin. Antimicrobial Agents and Chemotherapy, 2016;60(10):5957-5967. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Oncology - Breast Cancer

Studies from University of the Pacific Add New Findings in the Area of Breast Cancer (Expanding the view of breast cancer metabolism: Promising molecular targets and therapeutic opportunities)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news reporting out of Hillsboro, Oregon, by NewsRx editors, research stated, "The changes in breast cancer cells that contribute to tumor evolution, heterogeneity, metastasis and ultimately drug resistance are shaped by numerous genetic changes including alterations in cellular metabolism."

Our news journalists obtained a quote from the research from the University of the Pacific, "These include intermediary metabolic pathways such as glycolysis, the citric acid cycle oxidative phosphorylation, amino acid synthesis and lipid metabolism. However, cancer cells also exhibit key alterations in other metabolic pathways involved in drug metabolism such as cytochrome P450 enzymes, sulfotransferase and steroid sulfatases that are involved in the synthesis of estrogens and themselves serve as drug targets."

According to the news editors, the research concluded: "In this review we bring together these two sides of metabolism, discuss the evidence underpinning their role in breast cancer development and bring to light promising therapeutic targets and up and coming pharmacologic agents."

For more information on this research see: Expanding the view of breast cancer metabolism: Promising molecular targets and therapeutic opportunities. Pharmacology & Therapeutics, 2016;167():60-73. Pharmacology & Therapeutics can be contacted at: Pergamon-Elsevier Science Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, England. Cardiovascular Diseases

Studies from Uppsala University Yield New Information about Cardiovascular Diseases (Effects of cigarette smoking on cardiovascular-related protein profiles in two community-based cohort studies)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases is now available. According to news reporting originating in Uppsala, Sweden, by NewsRx journalists, research stated, "Cardiovascular diseases account for the largest fraction of smoking-induced deaths. Studies of smoking in relation to cardiovascular-related protein markers can provide novel insights into the biological effects of smoking."

The news reporters obtained a quote from the research from Uppsala University, "We investigated the associations between cigarette smoking and 80 protein markers known to be related to cardiovascular diseases in two community-based cohorts, the Prospective Study of the Vasculature in Uppsala Seniors (PIVUS, n = 969, 50% women, all aged 70 years) and the Uppsala Longitudinal Study of Adult Men (ULSAM, n = 717, all men aged 77 years). Smoking status was self-reported and defined as current smoker, former smoker or never-smoker. Levels of the 80 proteins were measured using the proximity extension assay, a novel PCR-based proteomics technique. We found 30 proteins to be significantly associated with current cigarette smoking in PIVUS (FDR <5%); and ten were replicated in ULSAM (p <0.05). Matrix metalloproteinase-12 (MMP-12), growth/differentiation factor 15 (GDF-15), urokinase plasminogen activator surface receptor (uPAR), TNF-related apoptosis-inducing ligand receptor 2 (TRAIL-R2), lectin-like oxidized LDL receptor 1 (LOX-1), hepatocyte growth factor (HGF), matrix metalloproteinase-10 (MMP-10) and matrix metalloproteinase-1 (MMP-1) were positively associated, while endothelial cell-specific molecule 1 (ESM-1) and interleukin-27 subunit alpha (IL27-A) showed inverse associations. All of them remained significant in a subset of individuals without manifest cardiovascular disease."

According to the news reporters, the research concluded: "The findings of the present study suggest that cigarette smoking may interfere with several essential parts of the atherosclerosis process, as evidenced by associations with protein markers representing endothelial dysfunction, inflammation, neointimal formation, foam cell formation and plaque instability."

Our news correspondents report that additional information may be obtained by contacting E. Ingelsson, Uppsala University, Dept. of Med Sci, Mol Epidemiol & Sci Life Lab, S-75185 Uppsala, Sweden. Additional authors for this research include P. Svensson, J. Arnlov, J. Sundstrom, L. Lind and E. Ingelsson.

Mental Health Diseases and Conditions - Postpartum…

Studies from Uppsala University in the Area of Postpartum Depression Described [Associations between a polymorphism in the hydroxysteroid (11-beta) dehydrogenase 1 gene, neuroticism and postpartum depression]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mental Health Diseases and Conditions - Postpartum Depression. According to news reporting originating in Uppsala, Sweden, by NewsRx journalists, research stated, "This study examined the association between a single nucleotide polymorphism in the hydroxysteroid (11-beta) dehydrogenase 1 gene and neuroticism, as well as the possible mediatory role of neuroticism in the association between the polymorphism and postpartum depressive symptoms. 769 women received questionnaires containing the Edinburgh Postnatal Depression Scale (EPDS) at six weeks postpartum and demographic data at pregnancy week 17 and 32 and at six weeks postpartum, as well as the Swedish universities Scales of Personality at pregnancy week 32."

The news reporters obtained a quote from the research from Uppsala University, "Linear regression models showed an association between the GG genotype and depressive symptoms. When neuroticism was introduced in the model, it was associated with EPDS score, whereas the association between the GG genotype and EPDS became borderline significant. A path analysis showed that neuroticism had a mediatory role in the association between the polymorphism and EPDS score. Limitations: The use of the EPDS, which is a self-reporting instrument. Neuroticism was associated with the polymorphism and had a mediatory role in the association between the polymorphism and postpartum depression."

According to the news reporters, the research concluded: "This finding elucidates the genetic background of neuroticism and postpartum depression."

For more information on this research see: Associations between a polymorphism in the hydroxysteroid (11-beta) dehydrogenase 1 gene, neuroticism and postpartum depression. *Journal of Affective Disorders*, 2017;207():141-147. *Journal of Affective Disorders* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Studies from V.D. Lima et al Further Understanding of Cytokines (Are Interferon-Free Direct-Acting Antivirals for the Treatment of HCV Enough to Control the Epidemic among People Who Inject Drugs?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Intercellular Signaling Peptides and Proteins - Cytokines. According to news reporting from Vancouver, Canada, by NewsRx journalists, research stated, "Widely access to interferon-free direct-acting antiviral regimens (IFN-free DAA) is poised to dramatically change the impact of the HCV epidemic among people who inject drugs (PWID). We evaluated the long-term effect of increasing HCV testing, treatment and engagement into harm-reduction activities, focused on active PWID, on the HCV epidemic in British Columbia (BC), Canada."

The news correspondents obtained a quote from the research, "We built a compartmental model of HCV disease transmission stratified by disease progression, transmission risk, and fibrosis level. We explored the effect of: (1) Increasing treatment rates from 8 to 20, 40 and 80 per 1000 infected PWID/year; (2) Increasing treatment eligibility based on fibrosis level; (3) Maximizing the effect of testing by performing it immediately upon ending the acute phase; (4) Increasing access to harm-reduction activities to reduce the risk of re-infection; (5) Different HCV antiviral regimens on the Control Reproduction Number Rc. We assessed the impact of these interventions on incidence, prevalence and mortality from 2016 to 2030. Of all HCV antiviral regimens, only IFN-free DAAAs offered a high chance of disease elimination (i.e. Rc <1), but it would be necessary to substantially increase the current low testing and treatment rates. Assuming a treatment rate of 80 per 1000 infected PWID per year, coupled with a high testing rate, the incidence rate, at the end of 2030, could decrease from 92.9 per 1000 susceptible PWID per year (Status Quo) to 82.8 (by treating only PWID with fibrosis level F2 and higher) or to 65.5 (by treating PWID regardless of fibrosis level). If PWID also had access to increased harm-reduction activities, the incidence rate further decreased to 53.1 per 1000 susceptible PWID per year. We also obtained significant decreases in prevalence and mortality at the end of 2030. The combination of increased access to HCV testing, highly efficacious antiviral treatment and harm-reduction programs can substantially decrease the burden of the HCV epidemic among PWID."

According to the news reporters, the research concluded: "However, unless we increase the current levels of treatment and testing, the HCV epidemic among PWID in BC, and in other parts of the world with similar epidemiological background, will remain a substantial public health concern for many years."

Our news journalists report that additional information may be obtained by contacting V.D. Lima, British Columbia Centre for Excellence in HIV, AIDS, Vancouver, British Columbia, Canada. Additional authors for this research include I. Rozada, J. Grebely, M. Hull, L. Loureno, B. Nosyk, M. Krajden, E. Yoshida, E. Wood and J.S Montaner.

Pelvic Organ Prolapse

Studies from Vanderbilt University Provide New Data on Pelvic Organ Prolapse (Genetic Determinants of Pelvic Organ Prolapse among African American and Hispanic Women in the Women's Health Initiative)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Pelvic Organ Prolapse. According to news originating from Nashville, Tennessee, by NewsRx correspondents, research stated, "Current evidence suggests a multifactorial etiology to pelvic organ prolapse (POP), including genetic predisposition. We conducted a genome-wide association study of POP in African American (AA) and Hispanic (HP) women from the Women's Health Initiative Hormone Therapy study."

Our news journalists obtained a quote from the research from Vanderbilt University, "Cases were defined as any POP (grades 1-3) or moderate/severe POP (grades 2-3), while controls had grade 0 POP. We performed race-specific multiple logistic regression analyses between SNPs imputed to 1000 genomes in relation to POP (grade 0 vs 1-3; grade 0 vs 2-3) adjusting for age at diagnosis, body mass index, parity, and genetic ancestry. There were 1274 controls and 1427 cases of any POP and 317 cases of moderate/severe POP. Although none of the analyses reached genome-wide significance (p <5x10-8), we noted variants in several loci that met p<10-6. In race-specific analysis of grade 0 vs 2-3, intronic SNPs in the CPE gene (rs28573326, OR:2.14; 95% CI 1.62-2.83; p=1.0x10-7) were associated with POP in AAs, and SNPs in the gene AL132709.5 (rs1950626, OR:2.96; 95% CI 1.96-4.48, p=2.6x10-7) were associated with POP in HPs. Inverse variance fixed-effect meta-analysis of the race-specific results showed suggestive signals for SNPs in the DPP6 gene (rs11243354, OR:1.36; p=4.2x10-7) in the grade 0 vs 1-3 analyses and for SNPs around PGBD5 (rs740494, OR:2.17; p=8.6x10-7) and SHC3 (rs2209875, OR:0.60; p=9.3x10-7) in the grade 0 vs 2-3 analyses. While we did not identify genome-wide significant findings, we document several SNPs reaching suggestive statistical significance."

According to the news editors, the research concluded: "Further interrogation of POP in larger minority samples is warranted."

For more information on this research see: Genetic Determinants of Pelvic Organ Prolapse among African American and Hispanic Women in the Women's Health Initiative. Plos One, 2015;10(11):e0141647. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

**Studies from Vesalius Research Center in the Area of Chemotherapy Described (Inhibition of the Glycolytic Activator PFKFB3 in Endothelium Induces Tumor Vessel Normalization, Impairs Metastasis, and Improves Chemotherapy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Chemotherapy. According to news reporting originating in Leuven, Belgium, by NewsRx journalists, research stated, "Abnormal tumor vessels promote metastasis and impair chemotherapy. Hence, tumor vessel normalization (TVN) is emerging as an anti-cancer treatment."

Financial supporters for this research include Research Foundation Flanders, Erasmus Mundus, ERAWEB fellowship, Else Kroener-Fresenius-Stiftung, Austrian Science Fund, Agency for Innovation by Science and Technology, Flanders, Bettencourt Schueller Foundation, NIH, Belgian Science Policy, FWO, Foundation Leducq Transatlantic Network, Foundation against Cancer, European Research Council, Advanced Research Grant, AXA Research grant.

The news reporters obtained a quote from the research from Vesalius Research Center, "Here, we show that tumor endothelial cells (ECs) have a hyperglycolytic metabolism, shunting intermediates to nucleotide synthesis. EC haplo-deficiency or blockade of the glycolytic activator PFKFB3 did not affect tumor growth, but reduced cancer cell invasion, intravasation, and metastasis by normalizing tumor vessels, which improved vessel maturation and perfusion. Mechanistically, PFKFB3 inhibition tightened the vascular barrier by reducing VE-cadherin endocytosis in ECs, and rendering pericytes more quiescent and adhesive (via upregulation of N-cadherin) through glycolysis reduction; it also lowered the expression of cancer cell adhesion molecules in ECs by decreasing NF-kappa B signaling."

According to the news reporters, the research concluded: "PFKFB3-blockade treatment also improved chemotherapy of primary and metastatic tumors."

For more information on this research see: Inhibition of the Glycolytic Activator PFKFB3 in Endothelium Induces Tumor Vessel Normalization, Impairs Metastasis, and Improves Chemotherapy. *Cancer Cell*, 2016;30(6):968-985. *Cancer Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cancer Cell - www.journals.elsevier.com/cancer-cell/)

Oncology - Liver Cancer

Studies from Veterans Affairs Medical Center Add New Findings in the Area of Liver Cancer (Effectiveness of surveillance for hepatocellular carcinoma in clinical practice: A United States cohort)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Liver Cancer is now available. According to news reporting originating in Houston, Texas, by NewsRx journalists, research stated, "The effectiveness of surveillance for hepatocellular carcinoma (HCC) in reducing cancer related mortality among patients with cirrhosis is largely unknown. The objective of this study was to study the effectiveness of HCC surveillance in the national Veterans Administration (VA) clinical practice."

The news reporters obtained a quote from the research from Veterans Affairs Medical Center, "We conducted a retrospective cohort study of patients with HCC during 2005-2010 by reviewing patients' medical records to determine receipt of HCC surveillance in the 2 years prior to HCC diagnosis. We determined association of HCC surveillance with overall mortality adjusting for age, risk factors, model for end-stage liver disease (MELD) score, comorbidity index, alpha-fetoprotein levels, healthcare utilization, Barcelona Clinic Liver Cancer (BCLC) stage, and treatment. We accounted for lead and length time biases. Of 887 patients with HCC, only 412 (46.5%) received any surveillance prior to HCC diagnosis. Patients who received surveillance were significantly more likely to have early stage disease HCC (BCLC stage 0/A 27.2% vs. 11.6%) and receive potentially curative (20.9% vs. 11.6%) or palliative (59.2% vs. 45.5%) treatments compared to those without HCC surveillance. Receipt of HCC surveillance was associated with 38% reduction in mortality risk (unadjusted hazard ratios (HR) 0.62, 95% confidence intervals (CI) 0.54-0.71) that declined to 20% (HR 0.80, 95% CI 0.69-0.94) after adjusting for HCC stage and treatment, compared to those without HCC surveillance. Among patients with HCC, pre-diagnosis HCC surveillance is associated with a significant 38% reduction in overall mortality. The reduction in mortality risk with surveillance is mediated via stage migration and receipt of HCC specific treatment. Lay summary: Surveillance for liver cancer leads to earlier detection of cancer and increases chances of getting curative treatment."

According to the news reporters, the research concluded: "This ultimately leads to increased longevity in patients with liver cancer."

Studies from Veterans Affairs Medical Center Have Provided New Data on Bradycardia (Sleep-disordered breathing and daytime cardiac conduction abnormalities on 12-lead electrocardiogram in community-dwelling older men)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Bradycardia is the subject of a report. According to news reporting from Minneapolis, Minnesota, by NewsRx journalists, research stated, "Nocturnal cardiac conduction abnormalities are commonly observed in patients with sleep-disordered breathing (SDB). However, few population-based studies have examined the association between SDB and daytime cardiac conduction abnormalities."

Funders for this research include National Institute on Aging, National Heart, Lung, and Blood Institute.

The news correspondents obtained a quote from the research from Veterans Affairs Medical Center, "We examined a random sample of 471 community-dwelling men, aged ae67 years, enrolled in the multi-center Outcomes of Sleep Disorders in Older Men (MrOS Sleep) study. SDB severity was categorized using percent of total sleep time with oxygen saturation < 90 % (%TST < 90) and apnea hypopnea index (AHI). Cardiac conduction parameters were assessed by resting 12-lead electrocardiography (ECG). All analyses were adjusted for age, site, beta-blocker use, coronary heart disease, calcium channel blocker use, and use of antiarrhythmic medications. Mean age was 77 +/- 6 years, median %TST < 90 was 0.7 (IQR 0.00-3.40), and median AHI was 7.06 (IQR 2.55-15.32). Men with greater nocturnal hypoxemia (%TST < 90 ae 3.5 %) compared with those without hypoxemia (%TST < 90 < 1.0 %) had a lower odds of bradycardia (OR 0.55 [0.32-0.94]) and right bundle branch block (RBBB) (OR 0.24 [0.08-0.75]) but a higher odds of ventricular paced rhythm (OR 4.42 [1.29-15.19]). Heart rate (HR) increased in a graded manner with increasing %TST < 90 (p-trend 0.01) and increasing AHI (p-trend 0.006), but these gradients were small in absolute magnitude. There were no associations of SDB measures with other ECG conduction parameters."

According to the news reporters, the research concluded: "Greater nocturnal hypoxemia in older men was associated with a lower prevalence of daytime sinus bradycardia..."
and RBBB, a higher prevalence of ventricular paced rhythm, and higher resting HR."

For more information on this research see: Sleep-disordered breathing and daytime cardiac conduction abnormalities on 12-lead electrocardiogram in community-dwelling older men. Sleep and Breathing, 2016;20(4):1161-1168. Sleep and Breathing can be contacted at: Springer Heidelberg, Tiergartenstrasse 17, D-69121 Heidelberg, Germany. (Springer - www.springer.com; Sleep and Breathing - www.springerlink.com/content/1520-9512/)

Alcohol-Induced Diseases and Conditions - Alcoholic…

Studies from Veterans Affairs Medical Center in the Area of Alcoholic Hepatitis Described (Effects of Age, Sex, Body Weight, and Quantity of Alcohol Consumption on Occurrence and Severity of Alcoholic Hepatitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Alcohol-Induced Diseases and Conditions - Alcoholic Hepatitis. According to news reporting originating in Indianapolis, Indiana, by NewsRx journalists, research stated, "Only a minority of heavy drinking individuals develop alcoholic hepatitis (AH), for unclear reasons. We analyzed data from the Translational Research and Evolving Alcoholic Hepatitis Treatment cohort, consisting of subjects who drink heavily with normal results from liver tests (controls) and patients with AH."

The news reporters obtained a quote from the research from Veterans Affairs Medical Center, "We examined risk factors for the development of AH including body mass index (BMI), drinking pattern and quantity, and sex. We compared data from 145 patients with AH and 124 controls based on BMI when they joined the cohort; groups were matched for sex and race. Drinking patterns were assessed using the timeline followback method, the Alcohol Use Disorders Identification Test, and the National Institute of Alcohol Abuse and Alcoholism 6-question survey. We performed univariable and multivariable analyses to assess the effects of these factors and their interaction in increasing the risk for AH. We also explored the association between PNPLA3 variants and AH. Cases with AH were older (47 vs 44 y; P = .03). For nearly all measures of quantity of alcohol consumed or frequency of binge drinking, controls drank more heavily than cases with AH. We did not find an association between BMI, sex, drinking patterns, and the presence of AH. Age and BMI were independent predictors for the severity of AH. When we analyzed cases and controls of European ancestry, the PNPLA3 single-nucleotide polymorphism rs738409 was associated with risk for AH (odds ratio, 1.89; P = .007). Compared
with heavy drinkers without liver disease, subjects with AH consumed lower levels of alcohol and had less binge drinking, suggesting an increased sensitivity to the toxic effects of alcohol."

According to the news reporters, the research concluded: "The risk for AH may be associated with the PNPLA3 rs738409 polymorphism."

For more information on this research see: Effects of Age, Sex, Body Weight, and Quantity of Alcohol Consumption on Occurrence and Severity of Alcoholic Hepatitis. *Clinical Gastroenterology and Hepatology*, 2016;14(12):1831-1838. *Clinical Gastroenterology and Hepatology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. **Silicon**

**Studies from Voronezh State University in the Area of Silicon Reported (Study of the deposition process of vinpocetine on the surface of porous silicon)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Silicon is the subject of a report. According to news originating from Voronezh, Russia, by NewsRx correspondents, research stated, "Currently the most prospective way in pharmacotherapy is the obtaining of nanoparticles involving pharmaceutical substances. Application of porous inorganic materials on the basis of silicon is among the main features in solving of this problem."

Our news journalists obtained a quote from the research from Voronezh State University, "The present work is concerned with the problem of the deposition of pharmaceutical drug with nootropic activity - vinpocetine - into porous silicon. Silicon nanoparticles were obtained by electrochemical anodic etching of Si plates. The process of vinpocetine deposition was studied in dependence of the deposition time."

According to the news editors, the research concluded: "As a result of the investigations it was found that infrared transmission spectra of porous silicon with the deposited vinpocetine revealed the absorption bands characteristic of vinpocetine substance."

For more information on this research see: Study of the deposition process of vinpocetine on the surface of porous silicon. *Results in Physics*, 2016;6():337-338. *Results in
Studies from W. Dolak and Co-Researchers Yield New Data on Gastrointestinal Endoscopy (A retrospective study on the safety, diagnostic yield, and therapeutic effects of endoscopic unroofing for small gastric subepithelial tumors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Surgical Procedures - Gastrointestinal Endoscopy. According to news reporting originating from Vienna, Austria, by NewsRx correspondents, research stated, "Accurate diagnosis of small gastric subepithelial tumors (SETs) is essential to assess their malignant potential. Endoscopic unroofing has been reported to yield sufficient tissue samples for histologic evaluation."

Our news editors obtained a quote from the research, "This study aimed to evaluate the safety, diagnostic yield, and potential therapeutic effects of this technique over time. This retrospective analysis of prospectively collected clinical data identified patients who underwent endoscopic unroofing at the Medical University of Vienna from January 2003 to December 2012. Demographic data, indications for endoscopic unroofing, intraprocedural adverse events, hospital stay, histologic results, and follow-up procedures were reviewed. A total of 14 patients (7 men; 7 women; median age, 70 years; range, 51-95 years) underwent endoscopic unroofing of 14 gastric SETs with a mean diameter of 26 +/- 13 mm at EUS. In 9 of 14 cases, endoscopic unroofing was done exclusively for diagnostic purposes; in the remaining cases, it was performed with therapeutic intent because of bleeding from the gastric SETs. Unroofing was technically successful in 13 of 14 cases and revealed 8 cases of GI stromal tumor (GIST) and 1 case each of leiomyoma, fibroid polyp, glomus tumor, pancreatic rest, and nondiagnostic material at histology. Intraprocedural bleeding was the only adverse event (4 cases) and could be managed endoscopically. A follow-up EUS was available (median, 8 months) for 10 of the 14 patients. Notably, most patients showed complete regression of their gastric SETs after unroofing (on white light and EUS), including the glomus tumor, the leiomyoma, and 6 of the 8 cases of GIST. Endoscopic unroofing was safe and had a very favorable diagnostic yield in this study. Unexpectedly, it led to complete regression in most gastric SETs."

According to the news editors, the research concluded: "Although it is not an oncologically curative treatment, endoscopic unroofing can be a valuable option to treat local
adverse events in patients unfit for surgical therapy."

The news editors report that additional information may be obtained by contacting W. Dolak, Center Comprehens Canc, Gastroesophageal Tumor Unit, Vienna, Austria. Additional authors for this research include A. Beer, I. Kristo, B. Tribl, R. Asari, M. Schoniger-Hekele, F. Wrba, S.F. Schoppmann, M. Trauner and A. Puspok.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.gie.2016.04.019. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Pharmacology**

**Studies from W.B. Shen and Co-Researchers Yield New Data on Pharmacology (Discovery of a new structural class of competitive hDHODH inhibitors with in vitro and in vivo anti-inflammatory, immunosuppressive effects)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Pharmacology. According to news reporting originating from Shijiazhuang, People's Republic of China, by NewsRx correspondents, research stated, "Human dihydroorotate dehydrogenase (hDHODH) is an inner mitochondrial membrane enzyme that involves in the fourth step of the biosynthesis of pyrimidine base. Inhibitors of hDHODH have been proven efficacy for the treatments of inflammation, rheumatoid arthritis, multiple sclerosis and cancer."

Financial support for this research came from State Key New Drug Creation and Manufacturing Programs.

Our news editors obtained a quote from the research, "In the present study, ascochlorin (ASC) and its derivatives, natural compounds from fungal metabolites, were discovered as hDHODH inhibitors by high-throughput screening. Enzyme kinetics studies showed that ASC competitively binds to hDHODH at the site of coenzyme Q substrate. In ex vivo study, ASC significantly inhibited the ConA-stimulated T lymphocytes proliferation and interleukin-2, interferon-y production. Furthermore, ASC showed significant in vivo anti-inflammatory and immunosuppressive effects on the mice ears swelling, allogenic skin grafts and rat collagen-induced arthritis animal disease models. ASC significantly reduced ears edema level of mice, increased the survival time of allogenic skin implanted on the mice and attenuated arthritis severity of rat model."

According to the news editors, the research concluded: "ASC was identified as a new structural class of hDHODH inhibitors with efficient anti-inflammatory, immunosuppressive
activity, and may be a promising candidate for the development of new therapy in the treatment of autoimmune diseases."

For more information on this research see: Discovery of a new structural class of competitive hDHODH inhibitors with in vitro and in vivo anti-inflammatory, immunosuppressive effects. **Gram-Negative Bacteria - Enterobacteriaceae**

**Studies from Wageningen University Reveal New Findings on Enterobacteriaceae (Molecular Characterization of Extended-Spectrum-Cephalosporin-Resistant Enterobacteriaceae from Wild Kelp Gulls in South America)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Gram-Negative Bacteria - Enterobacteriaceae is the subject of a report. According to news reporting out of Lelystad, Netherlands, by NewsRx editors, research stated, "Extended-spectrum-cephalosporin-resistant Enterobacteriaceae are a public health concern due to limited treatment options."

Our news journalists obtained a quote from the research from Wageningen University, "Here, we report on the occurrence and the molecular characteristics of extended-spectrum-cephalosporin-resistant Enterobacteriaceae recovered from wild birds (kelp gulls). Our results revealed kelp gulls as a reservoir of various extended-spectrum cephalosporinase genes associated with different genetic platforms."

According to the news editors, the research concluded: "In addition, we report for the first time the presence of a known epidemic clone of Salmonella enterica serotype Heidelberg (JF6X01.0326/XbaI. 1966) among wild birds."

For more information on this research see: Molecular Characterization of Extended-Spectrum-Cephalosporin-Resistant Enterobacteriaceae from Wild Kelp Gulls in South America. Antimicrobial Agents and Chemotherapy, 2016;60(11):6924-6927. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents..."

Cardiovascular Research

Studies from Washington University Further Understanding of Cardiovascular Research (Knowledge Gaps in Cardiovascular Care of Older Adults: A Scientific Statement from the American Heart Association, American College of Cardiology, and American ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Research is the subject of a report. According to news originating from St. Louis, Missouri, by NewsRx correspondents, research stated, "The incidence and prevalence of most cardiovascular disorders increase with age, and cardiovascular disease (CVD) is the leading cause of death and major disability in adults aged 75 and older. Despite the effect of CVD on quality of life, morbidity, and mortality in older adults, individuals aged 75 and older have been markedly underrepresented in most major cardiovascular trials, and virtually all trials have excluded older adults with complex comorbidities, significant physical or cognitive disabilities, frailty, or residence in nursing homes and assisted living facilities."

Our news journalists obtained a quote from the research from Washington University, "As a result, current guidelines are unable to provide evidence-based recommendations for diagnosis and treatment of older adults typical of those encountered in routine clinical practice. The objectives of this scientific statement are to summarize current guideline recommendations as they apply to older adults, identify critical gaps in knowledge that preclude informed evidence-based decision-making, and recommend future research to close existing knowledge gaps. To achieve these objectives, a detailed review was conducted of current American College of Cardiology/American Heart Association (ACC/AHA) and American Stroke Association (ASA) guidelines to identify content and recommendations that explicitly targeted older adults. A pervasive lack of evidence to guide clinical decision-making in older adults with CVD was found, as well as a paucity of data on the effect of diagnostic and therapeutic interventions on outcomes that are particularly important to older adults, such as quality of life, physical function, and maintenance of independence. Accordingly, there is a critical need for a multitude of large population-based studies and clinical trials that include a broad spectrum of older adults representative of those seen in clinical practice and that incorporate relevant outcomes important to older adults in the study design."

According to the news editors, the research concluded: "The results of these studies will provide the foundation for future evidence-based guidelines applicable to older adults and
enhan ce person-centered care of older individuals with CVD in the United States and around the world."

Oncology - Acute Myeloid Leukemia

Studies from Washington University School of Medicine Yield New Information about Acute Myeloid Leukemia (Targeting the leukemia-stroma interaction in acute myeloid leukemia: rationale and latest evidence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Acute Myeloid Leukemia are discussed in a new report. According to news originating from St. Louis, Missouri, by NewsRx correspondents, research stated, "The concept of 'niche' has become a focus of attention in hematologic malignancies including acute myeloid leukemia (AML). Similar to normal hematopoietic stem cells, AML cells interact both anatomically and functionally with the stroma within the marrow microenvironment."

Our news journalists obtained a quote from the research from the Washington University School of Medicine, "These interactions have a critical role in the development, progression, and relapse of AML. Chemotherapy resistance is another feature that is at least partially related to AML-stroma interactions. The evidence for safety and efficacy of agents targeting AML-niche interactions is currently limited to preclinical and early phase clinical studies. Examples include CXCR4 inhibitors, hypoxia-inducible agents, and adhesion molecule inhibitors. Agents that target AML-stroma interactions differ from mutation-specific approaches that tend to be limited due to within-individual and between-individual genetic heterogeneity. These agents may be used alone or as chemosensitizers in AML."

According to the news editors, the research concluded: "This novel and rapidly advancing strategy is likely to become an important part of our armamentarium of anti-leukemia
For more information on this research see: Targeting the leukemia-stroma interaction in acute myeloid leukemia: rationale and latest evidence. *Therapeutic Advances In Hematology*, 2016;7(1):40-51. (Sage Publications - www.sagepub.com; Therapeutic Advances In Hematology - tah.sagepub.com)

**Drugs and Therapies - Immunotherapy**

**Studies from Washington University School of Medicine in the Area of Immunotherapy Described (Improving natural killer cell cancer immunotherapy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Immunotherapy is the subject of a report. According to news reporting out of St. Louis, Missouri, by NewsRx editors, research stated, "Natural killer (NK) cells are innate lymphoid cells specialized to eliminate malignant cells via direct cytotoxicity and immunoregulatory cytokine production. As such, NK cells are ideal as cellular therapy for cancer patients, and several studies have provided proof of principle that adoptively transferred NK cells can induce remissions in patients with leukemia."

Our news journalists obtained a quote from the research from the Washington University School of Medicine, "A clear understanding of the mechanisms underlying NK cell antitumor responses, including target cell recognition, activation status, and negative regulatory signals will improve NK cellular therapy for cancer patients. Clinical studies have demonstrated the safety and preliminary efficacy of NK cell adoptive transfer, especially in hematologic malignancies. Various NK cell sources, isolation techniques, activation approaches, and ex-vivo expansion strategies are under investigation. New approaches have been developed and are being tested to optimize NK cell therapy, including ways to better target NK cells to malignant cells, increase their functional competence, facilitate expansion in patients, and limit inhibitory signals or cells. NK cells represent a promising cellular immunotherapy for the treatment of cancer."

According to the news editors, the research concluded: "In addition to adoptive cellular therapy, adjunct treatments that optimize NK cell targeting and function will enhance their potency and broaden their potential use to many cancer types."

For more information on this research see: Improving natural killer cell cancer immunotherapy. *Current Opinion In Organ Transplantation*, 2015;20(6):671-80. (Lippincott Williams and Wilkins - www.lww.com; Current Opinion In Organ Transplantation -

Life Science Research - Plant Physiology

Studies from Wayne State University Reveal New Findings on Plant Physiology (Evolutionary Fates and Dynamic Functionalization of Young Duplicate Genes in Arabidopsis Genomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Life Science Research - Plant Physiology are presented in a new report. According to news reporting originating in Detroit, Michigan, by NewsRx journalists, research stated, "Gene duplication is a primary means to generate genomic novelties, playing an essential role in speciation and adaptation. Particularly in plants, a high abundance of duplicate genes has been maintained for significantly long periods of evolutionary time."

The news reporters obtained a quote from the research from Wayne State University, "To address the manner in which young duplicate genes were derived primarily from small-scale gene duplication and preserved in plant genomes and to determine the underlying driving mechanisms, we generated transcriptomes to produce the expression profiles of five tissues in Arabidopsis thaliana and the closely related species Arabidopsis lyrata and Capsella rubella. Based on the quantitative analysis metrics, we investigated the evolutionary processes of young duplicate genes in Arabidopsis. We determined that conservation, neofunctionalization, and specialization are three main evolutionary processes for Arabidopsis young duplicate genes. We explicitly demonstrated the dynamic functionalization of duplicate genes along the evolutionary time scale. Upon origination, duplicates tend to maintain their ancestral functions; but as they survive longer, they might be likely to develop distinct and novel functions. The temporal evolutionary processes and functionalization of plant duplicate genes are associated with their ancestral functions, dynamic DNA methylation levels, and histone modification abundances. Furthermore, duplicate genes tend to be initially expressed in pollen and then to gain more interaction partners over time."

According to the news reporters, the research concluded: "Altogether, our study provides novel insights into the dynamic retention processes of young duplicate genes in plant genomes."

Drugs and Therapies - Antifungals

**Studies from Wayne State University Update Current Data on Antifungals (Adverse effects of voriconazole: Over a decade of use)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antifungals have been presented. According to news originating from Detroit, Michigan, by NewsRx correspondents, research stated, "Voriconazole use has increased since the drug's introduction in 2002, and new and unique adverse effects are emerging as patients undergo prolonged therapy. Most concerning is the increased risk of cutaneous malignancies, primarily squamous cell carcinoma (SCC); this risk is duration dependent and the associated malignancies tend to be more aggressive and multifocal."

Our news journalists obtained a quote from the research from Wayne State University, "Voriconazole is also associated with phototoxicity (which may be a precursor to malignancy), periostitis, hallucinations and encephalopathy, peripheral neuropathy, alopecia, nail changes, hyponatremia, and other adverse effects. Some toxicities (neuropsychiatric and gastrointestinal including hepatic) are seen in clear association with supratherapeutic serum voriconazole levels; thus, careful monitoring of voriconazole levels is a critical component of safe drug use."

According to the news editors, the research concluded: "Guidelines for screening for adverse effects after long-term voriconazole use may be beneficial and need to be established."

The news correspondents report that additional information may be obtained from M.T. Levine, Wayne State University, Dept. of Med, Div Infect Dis, Detroit, MI 48202, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ctr.12834. This DOI is a link to an online electronic document that is either free or for purchase.
Studies from Wayne State University in the Area of Cell Biology Described (GAPDH binds Akt to facilitate cargo transport in the early secretory pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Life Science Research - Cell Biology have been published. According to news reporting out of Detroit, Michigan, by NewsRx editors, research stated, "Glyceraldehyde-3-phosphate dehydrogenase (GAPDH) undergoes numerous post-translational modifications, which impart new function and influence intracellular location. For example, atypical PKC iota/lambda phosphorylates GAPDH that locates to vesicular tubular clusters and is required for retrograde membrane trafficking in the early secretory pathway."

Funders for this research include National Institutes of Health, American Diabetes Association.

Our news journalists obtained a quote from the research from Wayne State University, "GAPDH is also required in the endocytic pathway; substitution of Pro(234) to Ser (Pro(234)Ser) rendered CHO cells defective in endocytosis. To determine if GAPDH (Pro(234) Ser) could inhibit endoplasmic reticulum to Golgi trafficking, we introduced the recombinant mutant enzyme into several biochemical and morphological transport assays. The mutant protein efficiently blocked vesicular stomatitis virus-G protein transport. Because GAPDH binds to microtubules (MTs), we evaluated MT binding and MT intracellular distribution in the presence of the mutant. Although these properties were not changed relative to wild-type, GAPDH (Pro(234)Ser) altered Golgi complex morphology. We determined that the GAPDH point mutation disrupted association between the enzyme and the serine/threonine kinase Aid. Interestingly Rab1, which functions in anterograde-directed trafficking, stimulates GAPDH-Akt association with membranes in a quantitative binding assay. In contrast, Rab2 does not stimulate GAPDH-Akt membrane binding but instead recruits GAPDH-aPKC."

According to the news editors, the research concluded: "We propose a mechanism whereby the association of GAPDH with Aid or with aPKC serves as a switch to discriminate between anterograde directed cargo and recycling cargo retrieved back to the ER, respectively."

For more information on this research see: GAPDH binds Akt to facilitate cargo transport in the early secretory pathway. Experimental Cell Research, 2016;349(2):310-319. Experimental Cell Research can be contacted at: Elsevier Inc, 525 B Street, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Experimental Cell Research - www.journals.elsevier.com/experimental-cell-research/)

Our news journalists report that additional information may be obtained by contacting E.J. Tisdale, Wayne State University, Sch Med, Dept. of Pharmacol, Detroit, MI 48201, United States. Additional authors for this research include N.K. Talati, C.R. Artalejo and A. Shisheva.

Studies from Weill Cornell Medical College Have Provided New Data on Type 2 Diabetes (Novel Anti-glycemic Drugs and Reduction of Cardiovascular Risk in Diabetes: Expectations Realized, Promises Unmet)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been published. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "Purpose of Review The purpose is to review evidence on cardiovascular risks and benefits of new treatments for type 2 diabetes mellitus. In response to guidance issued by the Food and Drug Administration, thousands of patients have been enrolled in large randomized trials evaluating the cardiovascular effects of the three newest diabetes drug classes: glucagon-like peptide-1 (GLP-1) receptor agonists, sodium glucose cotransporter 2 (SGLT-2) inhibitors, and dipeptidyl peptidase-4 (DPP-4) inhibitors."

Our news journalists obtained a quote from the research from Weill Cornell Medical College, "Two studies of GLP-1 receptor agonists-one of liraglutide and one of semaglutide-have shown cardiovascular benefit relative to placebo, and one study of the SGLT-2 inhibitor empagliflozin has shown benefit. The other published cardiovascular outcome studies of the newest drug classes have generally supported safety, apart from an as-yet unresolved safety concern about increased rates of heart failure with DPP-4 inhibitors. Recent research suggests the thiazolidinedione pioglitazone may have beneficial effects on some cardiovascular outcomes as well, but these are counterbalanced by a known increase of the risk of heart failure with this drug. In general, more prospective randomized trial data is now available regarding the cardiovascular effects of the newer diabetes drugs than on the older drug classes. New evidence suggests that the newest diabetes drugs are safe from a cardiovascular perspective."

According to the news editors, the research concluded: "Evidence on benefit from at least some members of the GLP-1 receptor agonist and SGLT-2 inhibitor classes is encouraging but not yet decisive."

For more information on this research see: Novel Anti-glycemic Drugs and Reduction of Cardiovascular Risk in Diabetes: Expectations Realized, Promises Unmet. Current Atherosclerosis Reports, 2016;18(12):87-96. Current Atherosclerosis Reports can be contacted at: Current Medicine Group, 400 Market Street, Ste 700, Philadelphia, PA 19106, USA. **Drugs and Therapies - Chemotherapy**

**Studies from Weill Cornell Medical College Update Current Data on Chemotherapy (Intraperitoneal chemotherapy after interval debulking surgery for advanced-stage ovarian cancer: Feasibility and outcomes at a comprehensive cancer center)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Chemotherapy are presented in a new report. According to news reporting originating from New York City, New York, by NewsRx correspondents, research stated, "Intraperitoneal (IP)-based chemotherapy following primary debulking surgery (PDS), although associated with substantial toxicity, is supported by a strong evidence base. We sought to determine feasibility and outcomes of IP chemotherapy after interval debulking surgery (IDS) among patients deemed ineligible for PDS."

Our news editors obtained a quote from the research from Weill Cornell Medical College, "We identified all patients with high-grade, stage III/IV ovarian cancer treated at our institution with neoadjuvant chemotherapy (NACT) followed by IDS and postoperative chemotherapy from 1/2008-5/2013. IP and intravenous (IV) regimens were defined; demographic and clinical data were analyzed using appropriate statistics. Of 128 evaluable patients, 118 (92%) achieved <= 1 cm residual disease at IDS and 74 (58%) achieved a complete gross resection (CGR). An IP port was placed in 54/128 patients (42%), with 89% port utilization. Forty-eight (38%) of 128 patients received IP chemotherapy, 17 (13%) weekly IV paclitaxel/q3week carboplatin, and 63 (49%) q3week IV carboplatin/paclitaxel. Patients completed a median of 3 IP cycles (range, 2-6), with 3 (5.5%) of 54 ports removed due to complications. Overall survival (OS) for patients with a CGR treated with IP and weekly IV chemotherapy was 53.2 months (range, 24.7-NE), and 44.2 months (range, 30.2-NE) with any visible residual disease (p < 0.001). Median OS was 532 months (range, 44.5-NE) for IP-, not reached for weekly IV-, and 34.2 months (range, 27.5-49.8) for q3week IV-treated patients (p = 0.1). Patients administered IP after IDS had a high rate of successful port utilization, with few regimen switches."

According to the news editors, the research concluded: "Oncologic outcomes were optimal in patients with a CGR at IDS, regardless of chemotherapy used."

The news editors report that additional information may be obtained by contacting

Oncology - Gliomas

Studies from Weill Cornell Medical College Yield New Information about Gliomas (Repeat surgery for recurrent low-grade gliomas should be standard of care)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gliomas. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "The importance of surgery and maximal extent of resection (EOR) is well established in primary low-grade glioma (LGG) management. However, the role of surgery in the management of recurrent LGG is less clear."

The news reporters obtained a quote from the research from Weill Cornell Medical College, "A recent review on the management of recurrent LGG concluded there was insufficient evidence to recommend surgery. Here, we summarize the recent advances regarding the role of surgery, radiotherapy (RT) and chemotherapy in the management of recurrent LGG. There is increasing evidence to support maximal EOR for treating recurrent LGG, as it may improve progression free survival (PFS) after recurrence and overall survival (OS)."

According to the news reporters, the research concluded: "Based on the studies presented in this review, we suggest that repeat surgery with maximal EOR should be standard of care for recurrent LGG treatment."

For more information on this research see: Repeat surgery for recurrent low-grade gliomas should be standard of care. Clinical Neurology and Neurosurgery, 2016;151():18-23. Clinical Neurology and Neurosurgery can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Clinical Neurology and Neurosurgery - www.journals.elsevier.com/clinical-neurology-and-neurosurgery/)

Studies from Wenzhou Medical University Describe New Findings in Porins (Differential Expression of Aquaporins in Cervical Precursor Lesions and Invasive Cervical Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Membrane Proteins - Porins have been published. According to news reporting from Zhejiang, People's Republic of China, by NewsRx journalists, research stated, "Aquaporins (AQP) are highly expressed in tumor cells of different origins, particularly the aggressive tumors. The aim of this study was to investigate the expression of AQP isoforms during progression of squamous cervical cancer (SCC) and explore their associations with clinicopathologic variables of SCC."

The news correspondents obtained a quote from the research from Wenzhou Medical University, "Expression of AQP isoforms (1, 3, 4, 5, and 8) was detected by immunohistochemistry in 47 SCCs, 37 cervical intraepithelial neoplasia (CIN), and 16 normal cervical tissues. Specific expression of AQP protein in SCC was detected by Western blot. Double immunohistochemistry was used to examine whether AQP and vascular endothelial growth factor (VEGF) are coexpressed in SCC. Aquaporin 1 showed higher positivity rate in CIN than in SCC and normal cervical tissues (P < .05). The expression intensity of AQP3, 4, 5, and 8 was higher in SCC than that in normal cervical tissues, respectively (P < .05). The expression of AQP3 and 8 was higher in SCC than that in CIN, respectively (P < .05). The AQP4 expression was higher in CIN than in normal cervical tissues (P < .05). The expression of AQP3 in CIN III was higher than that in CIN I and II (P < .05). There was a significant increase in the expression of AQP1 in stage I than that in stage II (P < .05). Aquaporin 3 showed lower positivity in moderately and well-differentiated tumors compared to that in poorly differentiated tumors (P < .05). Finally, double immunohistochemistry illustrated that AQP1/AQP3/AQP8 and VEGF were coexpressed in SCC. Different AQP isoforms display specific expression patterns in normal cervical, CIN, and SCC tissues."

According to the news reporters, the research concluded: "This and the significant association with the clinicopathologic variables of SCC suggest that AQP isoforms might play different roles in the development of cervical cancer."

Studies from Wenzhou Medical University Provide New Data on Bosentan Therapy (Simultaneous Determination of Bosentan, Glimepiride, HYBOS and M1 in Rat Plasma by UPLC-MS-MS and its Application to Pharmacokinetic Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Bosentan Therapy. According to news originating from Zhejiang, People's Republic of China, by NewsRx correspondents, research stated, "A rapid and sensitive ultra-performance liquid chromatography-tandem mass spectrometry (UPLC-MS-MS) method for the simultaneous determination of bosentan (BOS), glimepiride (GLP), hydroxyl bosentan (HYBOS) and hydroxyl glimepiride (M1) in rat plasma using one-step protein precipitation was developed and validated. After addition of ambrisentan as an internal standard (IS), protein precipitation by acetonitrile was used in sample preparation."

Our news journalists obtained a quote from the research from Wenzhou Medical University, "Chromatographic separation was achieved on a Waters ACQUITY UPLC BEH C18 column (2.1 mm x 100 mm, 1.7 mu m particle size, Waters Corp., Milford, MA, USA) and inline 0.2 mu m stainless steel frit filter (Waters Corp.) with acetonitrile-0.1% formic acid as the mobile phase at a flow rate of 0.4 mL/min with gradient elution. The column temperature was maintained at 40 degrees C. Only 4 min was needed for an analytical run. The retention times were similar to 3.29 min for BOS, 3.56 min for GLP, 1.42 min for HYBOS, 1.53 min for M1 and 3.22 min for IS. Electrospray ionization source was employed and operated in positive-ion mode; multiple reaction monitoring mode was applied to target fragment ions m/z 552 -- > 202, m/z 568 -- > 202, m/z 491 -- > 352, m/z 507 -- > 352 and m/z 379 -- > 347 for BOS, HYBOS, GLP, M1 and IS, respectively. The assay was validated over concentration ranges of 25-5,000 ng/mL (r(2) = 0.9984) for BOS, 1-200 ng/mL (r(2) = 0.9999) for GLP, 0.5-100 ng/mL (r(2) = 0.9999) for HYBOS and 0.1-20 ng/mL (r(2) = 0.9984) for M1. Intra- and interday precision values for replicate quality control samples were within 14.2% for all analytes during the assay validation. Mean quality control accuracy values were within -3.3 to 14.4% of nominal values for all analytes. The mean recoveries of BOS, GLP, HYBOS, M1 and ambrisentan from the plasma exceeded 90.4%. The analytes were stable in rat plasma for at least 2 h at room temperature, 30 days at -40 degrees C and following at least three freeze-thaw cycles (-40 degrees C to room temperature).

According to the news editors, the research concluded: "This method was successfully applied to a pharmacokinetic study of coadministration of BOS and GLP in rats."

For more information on this research see: Simultaneous Determination of Bosentan, Glimepiride, HYBOS and M1 in Rat Plasma by UPLC-MS-MS and its Application to Pharmacokinetic Study. *Journal of Chromatographic Science*, 2016;54(7):1159-1165. *Journal
Studies from West China Second University Hospital Have Provided New Data on Science (Irisin promotes osteoblast proliferation and differentiation via activating the MAP kinase signaling pathways)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Science. According to news reporting originating from Chengdu, People's Republic of China, by NewsRx correspondents, research stated, "Physical exercise is able to improve skeletal health. However, the mechanisms are poorly known."

Our news editors obtained a quote from the research from West China Second University Hospital, "Irisin, a novel exercise-induced myokine, secreted by skeletal muscle in response to exercise, have been shown to mediate beneficial effects of exercise in many disorders. In the current study, we demonstrated that irisin promotes osteoblast proliferation, and increases the expression of osteoblastic transcription regulators, such as Runx-related transcription factor-2, osterix/sp7; and osteoblast differentiation markers, including alkaline phosphatase, collagen type 1 alpha-1, osteocalcin, and osteopontin in vitro. Irisin also increase ALP activity and calcium deposition in cultured osteoblast. These osteogenic effects were mediated by activating the p38 mitogen-activated protein kinase (p-p38 MAPK) and extracellular signal-regulated kinase (ERK). Inhibition of p38 MAPK by SB023580 or pERK by U0126 abolished the proliferation and up-regulatory effects of irisin on Runx2 expression and ALP activity. Together our observation suggest that irisin directly targets osteoblast, promoting osteoblast proliferation and differentiation via activating P38/ERK MAP kinase signaling cascades in vitro."

According to the news editors, the research concluded: "Whether irisin can be utilized as the therapeutic agents for osteopenia and osteoporosis is worth to be further pursued."

For more information on this research see: Irisin promotes osteoblast proliferation and differentiation via activating the MAP kinase signaling pathways. Scientific Reports, 2016;6 ():18732. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting X.
Studies from Western University Have Provided New Information about Atherosclerosis (Trimethylamine-N-oxide: a link between the gut microbiome, bile acid metabolism, and atherosclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Atherosclerosis have been published. According to news reporting out of London, Canada, by NewsRx editors, research stated, "This article evaluates the link between trimethylamine-N-oxide (TMAO) and bile acids and the consequent impact on the development of atherosclerosis. Elevation in plasma TMAO concentrations is associated with an increased risk of cardiovascular disease in many different patient cohorts."

Our news journalists obtained a quote from the research from Western University, "In addition to the recently identified direct effects of TMAO on the development of atherosclerosis, other components involved in TMAO metabolism may also have an impact. Furthermore, the relationship between TMAO and bile acid regulation is emerging as a possible mediator of atherosclerosis. Studies that are emerging highlight the mechanistic relationship of TMAO to the development atherosclerosis in addition to its role as disease biomarker. The interplay between TMAO and bile acid metabolism mediated through multiple factors, such as the gut microbiome, farnesoid X receptor signaling, and flavin monoxygenase 3 activity may help identify another pathway by which atherosclerosis occurs."

According to the news editors, the research concluded: "In this review, we discuss the most recent data regarding atherosclerosis, TMAO, and bile acid metabolism."

For more information on this research see: Trimethylamine-N-oxide: a link between the gut microbiome, bile acid metabolism, and atherosclerosis. Current Opinion In Lipidology, 2016;27(2):148-54. (Lippincott Williams and Wilkins - www.lww.com; Current Opinion In Lipidology - journals.lww.com/co-lipidology/pages/default.aspx)

Our news journalists report that additional information may be obtained by contacting A. Wilson, aDivisions of Clinical Pharmacology bGastroenterology, Dept. of Medicine cDept. of Physiology and Pharmacology, Western University, London, ON, Canada. Additional authors for this research include C. McLean and R.B Kim.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1097/MOL.0000000000000274. This DOI is a link to an online electronic document that is either free or for purchase.
Studies from Western University Have Provided New Information about Dyslipidemias (Proprietary Considerations in the Use of Cardiovascular Genetic Data)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Dyslipidemias are presented in a new report. According to news reporting originating in London, Canada, by NewsRx journalists, research stated, "Cardiovascular researchers and clinicians who analyze next-generation sequencing data often search databases of previously reported mutations to determine if an observed mutation is pathogenic. In 2012 we created a database of all reported mutations causing human dyslipidemia syndromes."

The news reporters obtained a quote from the research from Western University, "In 2015, we were advised that some information in our database was now proprietary, after the acquisition of a human disease genetic database by a private biotechnology company. To make our dyslipidemia database and tables of mutations compliant with this new reality, we wrote custom computer scripts to remove certain data fields from the previously reported tables. Data columns in the revised tables now include: accession number, gene name and symbol, mutation type, exon number, inheritance pattern, minor allele frequencies, predictive functional scores, reported functional effects, and additional patient information. The revised mutation tables provide a comprehensive qualitative and quantitative description of genetic variants causing monogenic dyslipidemias, but do not have complete information on all mutations. This experience indicates that free and unlimited access to human disease mutation data should not be taken for granted."

According to the news reporters, the research concluded: "Investigators or clinicians who require additional data that is not within the revised tables can still access the data through academic institutions that hold subscriptions to proprietary human mutation databases."

Our news correspondents report that additional information may be obtained by contacting M. Kolovic, Western Univ, Robarts Res Inst, Schulich Sch Med & Dental, London, ON, Canada. Additional authors for this research include J.F. Robinson and R.A. Hegele.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cjca.2016.02.033. This DOI is a link to an online electronic document that is either free or for purchase.
Cardiovascular Diseases and Conditions -

Studies from Wroclaw University Yield New Data on Atherosclerosis
[Iridoid-loganic acid versus anthocyanins from the Cornus mas fruits (cornelian cherry): Common and different effects on diet-induced atherosclerosis, PPARs expression and ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Atherosclerosis. According to news reporting out of Wroclaw, Poland, by NewsRx editors, research stated, "Cardiovascular benefits of fruits are attributed mainly to their (poly)phenolic constituents, especially anthocyanins. The main aim of our study is to compare effects of iridoids and anthocyanins from one fruit on diet-induced atherosclerosis."

Our news journalists obtained a quote from the research from Wroclaw University, "The cornelian cherry is a native or cultivated plant that grows in many European countries, used in cuisine and folk medicine. In our previous study, we showed its constituents and proved that oral administration of lyophilized fruits to hypercholesterolemic rabbits had preventive effects on atherosclerosis through the activation of PPAR alpha expression. In this study, we have compared the effects of the main constituents of the cornelian cherry: iridoid loganic acid and anthocyanins. Our experiment followed the model used in our previous study, in which rabbits were fed 1% cholesterol. We showed that both loganic acid (20 mg/kg b.w.) and amixture of anthocyanins (10mg/kg b.w.) administered orally for 60 days had a positive impact on dyslipidemia caused by cholesterol-rich diet, although the effects of anthocyanins were more pronounced. Anthocyanins decreased total and LDL-cholesterol and triglycerides and increased HDL-cholesterol. Loganic acid showed similar effects, but only the triglycerides and HDL-cholesterol changes achieved statistical significance. Anthocyanins, and to a lesser extent loganic acid, significantly decreased intima thickness and intima/media ratio in the thoracic aorta. Both substances decrease ox-LDL in the plasma. Anthocyanins significantly increased expression of PPAR gamma and alpha in the liver. Loganic acid also increased their expression, but to a lesser extent. Conversely, loganic acid showed pronounced anti-inflammatory effects, decreasing TNF-alpha and IL-6 activity. Our results imply that both substances have a positive effect on factors contributing to the development of diet-induced atherosclerosis."

According to the news editors, the research concluded: "Our results also indicate the potential health benefits of fruits containing anthocyanins and iridoids, and support the idea of creating composed phytopharmaceuticals containing both groups of substances."

For more information on this research see: Iridoid-loganic acid versus anthocyanins from the Cornus mas fruits (cornelian cherry): Common and different effects on diet-induced atherosclerosis, PPARs expression and inflammation. Atherosclerosis, 2016;254():151-160. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Lactones

Studies from Wroclaw University of Environmental and Life Sciences in the Area of Lactones Described (Chemoenzymatic Synthesis of trans-beta-Aryl-delta-hydroxy-gamma-lactones and Enzymatic Kinetic Resolution of Their Racemic Mixtures)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lactones have been published. According to news reporting originating from Wroclaw, Poland, by NewsRx correspondents, research stated, "Two novel and convenient routes to obtain enantiomerically enriched trans-beta-aryl-delta-hydroxy-gamma-lactones 5a-d with potential antifeedant and anticancer activity were developed. In the first method starting from corresponding enantiomers of gamma,beta-unsaturated esters 4a-d derived from enzymatically resolved allyl alcohols 1a-d, both enantiomers of hydroxylactones 5a-d were synthesized with high enantiomeric excesses (73%-97%)."

Our news editors obtained a quote from the research from the Wroclaw University of Environmental and Life Sciences, "Configurations of the stereogenic centers of the synthesized compounds were assigned based on the mechanism of acidic lactonization of esters 4a-d in the presence of m-chloroperbenzoic acid (m-CPBA). An alternative method for the production of optically active trans-beta-aryl-delta-hydroxy-gamma-lactones 5a-d was lipase-catalyzed kinetic resolution of their racemic mixtures by transesterification with vinyl propionate as the acyl donor. The most efficient enzyme in the screening procedure was lipase B from Candida antarctica. Its application on a preparative scale after 6 h afforded unreacted (+)-(4S,5R,6S)-hydroxylactones 5a-d and (+)-(4R,5S,6R)-propionates 6a-d, most of them with high enantiomeric excesses (92%-98%). Resolution of lactone 5d with bulky 1,3-benzodioxol ring provided products with significantly lower optical purity (ee = 89% and 84% for hydroxylactone 5d and propionate 6d, respectively)."

According to the news editors, the research concluded: "The elaborated methods give access to both enantiomers of trans-beta-aryl-delta-hydroxy-gamma-lactones 5a-d with the defined absolute configurations of stereogenic centers, which is crucial requirement for the investigations of relationship: spatial structure-biological activity."

For more information on this research see: Chemoenzymatic Synthesis of trans-beta-Aryl-delta-hydroxy-gamma-lactones and Enzymatic Kinetic Resolution of Their Racemic Mixtures. *Molecules*, 2016;21(11):1974-1987. *Molecules* can be contacted at: Mdpj Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. Studies from Xi’an Jiao Tong University Describe New Findings in Hypertension (Exercise training attenuates renovascular hypertension partly via RAS-ROS-glutamate pathway in the hypothalamic paraventricular nucleus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Hypertension. According to news reporting originating in Xi’an, People's Republic of China, by NewsRx journalists, research stated, "Exercise training (ExT) has been reported to benefit hypertension; however, the exact mechanisms involved are unclear. We hypothesized that ExT attenuates hypertension, in part, through the reninangiotensin system (RAS), reactive oxygen species (ROS), and glutamate in the paraventricular nucleus (PVN)."

The news reporters obtained a quote from the research from Xi’an Jiao Tong University, "Two-kidney, one-clip (2K1C) renovascular hypertensive rats were assigned to sedentary (Sed) or treadmill running groups for eight weeks. Dizocilpine (MK801), a glutamate receptor blocker, or losartan (Los), an angiotensin II type1 receptor (AT1-R) blocker, were microinjected into the PVN at the end of the experiment. We found that 2K1C rats had higher mean arterial pressure (MAP) and renal sympathetic nerve activity (RSNA). These rats also had excessive oxidative stress and overactivated RAS in PVN. Eight weeks of ExT significantly decreased MAP and RSNA in 2K1C hypertensive rats. ExT inhibited angiotensin-converting enzyme (ACE), AT1-R, and glutamate in the PVN, and angiotensin II (ANG II) in the plasma. Moreover, ExT attenuated ROS by augmenting copper/zinc superoxide dismutase (Cu/Zn-SOD) and decreasing p(47phox) and gp(91phox) in the PVN. MK801 or Los significantly decreased blood pressure in rats."

According to the news reporters, the research concluded: "Together, these findings suggest that the beneficial effects of ExT on renovascular hypertension may be, in part, through the RAS-ROS-glutamate pathway in the PVN."

For more information on this research see: Exercise training attenuates renovascular hypertension partly via RAS-ROS-glutamate pathway in the hypothalamic paraventricular nucleus. Scientific Reports, 2016;6():1-10. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. **Oncology - Liver Cancer**

**Studies from Xi'an Jiao Tong University Further Understanding of Liver Cancer [Preoperative aspartate aminotransferase-to-platelet ratio index (APRI) is a predictor on postoperative outcomes of hepatocellular carcinoma]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liver Cancer. According to news reporting originating in Xi'an, People's Republic of China, by NewsRx journalists, research stated, "Preoperative aspartate aminotransferase-to-platelet ratio index (APRI) has been identified as a biochemical marker for histological fibrogenesis and fibrosis in cirrhosis and prognosis of hepatocellular carcinoma (HCC). Whether preoperative APRI can predict postoperative short-term outcomes has not been studied."

The news reporters obtained a quote from the research from Xi'an Jiao Tong University, "The purpose of this study was to investigate the ability of preoperative APRI to predict short-term outcomes following liver resection for HOC. APRI was evaluated in 360 patients undergoing liver resection for HCC. The receiver operating characteristic curve analysis was conducted to determine the cutoff value of the APRI in predicting postoperative morbidity. Univariate and multivariate analysis was performed to identify the risk factors for postoperative outcomes. The correlation of the preoperative APRI value with clinicopathological parameters was also examined. We found that the optimal cutoff value of the APRI was set at 9.5 for postoperative complications. APRI was an independent risk factor for overall complications by univariate and multivariate analyses. HCC patients with elevated APRI (>9.5) had a worse liver function and significantly higher postoperative complication rate."

According to the news reporters, the research concluded: "Preoperative APRI is a useful biochemical marker to predict postoperative outcomes in HCC patients."

For more information on this research see: Preoperative aspartate aminotransferase-to-platelet ratio index (APRI) is a predictor on postoperative outcomes of hepatocellular carcinoma. *Medicine*, 2016;95(48):161-166. *Medicine* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Studies from Xi'an Jiao Tong University Have Provided New Data on Endotoxins (Esculin attenuates endotoxin shock induced by lipopolysaccharide in mouse and NO production in vitro through inhibition of NF-kappa B activation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biological Factors - Endotoxins. According to news originating from Xi'an, People's Republic of China, by NewsRx correspondents, research stated, "Esculin, a coumarin compound derived from the traditional Chinese herbs such as Cortex Fraxini, has long been used for treating inflammatory and vascular diseases. In present study, we analyzed the role of esculin against macrophages and endotoxin shock induced by lipopolysaccharide (LPS) in mice."

Our news journalists obtained a quote from the research from Xi'an Jiao Tong University, "Here, we demonstrated that esculin suppressed inflammatory reactions in macrophages and protected mice from LPS-induced endotoxin shock. We found that esculin significantly inhibited the production of nitric oxide (NO) production via the inhibition of nuclear factor-kappa B (NF-kappa B) activation in macrophages. In animal model, esculin pretreatment significantly improved the survival rate of mice. LPS-induced increase of tumor necrosis factor alpha (TNF-alpha) and interleukin-6 (IL-6) in serum, lung, liver and kidney were markedly inhibited by esculin. IL-10, an anti-inflammatory cytokine, was up-regulated by esculin. Moreover, the histopathological analyses showed that esculin significantly attenuated the tissues injury of lung, liver, kidney in endotoxic mice. In addition, esculin significantly diminished the protein expression of NF-kappa B p65 in lung, liver, kidney, which resulted in lower levels of inflammatory mediators."

According to the news editors, the research concluded; "These results suggest that esculin may be a potential drug for treatment of various inflammatory diseases."

For more information on this research see: Esclusin attenuates endotoxin shock induced by lipopolysaccharide in mouse and NO production in vitro through inhibition of NF-kappa B activation. European Journal of Pharmacology, 2016;791():726-734. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Studies from Xi'an Medical University Have Provided New Data on Drug Delivery Systems (Rapid and efficient crossing, blood-brain barrier: Hydrophobic drug delivery system based on propionylated amylose helix nanoclusters)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Drug Delivery Systems have been published. According to news reporting originating in Xi'an, People's Republic of China, by NewsRx journalists, research stated, "A novel strategy of rapid transport across the blood-brain barrier (BBB) via phosphatidylethanolamine-triggered release is developed through both molecular dynamics (MD) simulation and experiments. Hydrophobic drugs, namely, propofol, iodine, and 1,1'-dioctadecyltetramethyl indotricarbocyanine iodide, were loaded with propionylated amylose helix (HLPAH) nanoclusters to form PLPAH, ILPAH, and DLPAH nanoclusters, respectively."

The news reporters obtained a quote from the research from Xi'an Medical University, "These clusters were subjected to MD simulation, structure measurement, in vitro triggered study, in vivo DLPAH imaging, and analysis of PLPAH sedative effects on rabbits. Results indicated that HLPAH nanoclusters were, initially located on the BBB, and the helix was unfolded to release the loaded hydrophobic drugs. The released drugs crossed the BBB and performed their functions in the central nervous system (CNS) through concentration gradient and hydrophobicity. This mechanism of HLPAH across the BBB featured high membrane permeability and specificity, rapid onset, short maintenance, rapid recovery, and lower dosage of drugs."

According to the news reporters, the research concluded: "Hence, this novel strategy is very meaningful for the development of CNS drug carriers and the proposed system could be used to improve the therapeutic effects of CNS diseases."

For more information on this research see: Rapid and efficient crossing, blood-brain barrier: Hydrophobic drug delivery system based on propionylated amylose helix nanoclusters. *Biomaterials*. 2017;113():133-144. *Biomaterials* can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. Necroptosis

Studies from Xiamen University Yield New Information about Necroptosis (Hsp90 modulates the stability of MLKL and is required for TNF-induced necroptosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Necroptosis. According to news reporting from Fujian, People's Republic of China, by NewsRx journalists, research stated, "The pseudokinase mixed lineage kinase domain-like protein (MLKL) is a key component of tumor necrosis factor (TNF)-induced necroptosis and plays a crucial role in necroptosis execution. However, the mechanisms that control MLKL activity are not completely understood."

The news correspondents obtained a quote from the research from Xiamen University, "Here, we identify the molecular chaperone Hsp90 as a novel MLKL-interacting protein. We show that Hsp90 associates with MLKL and is required for MLKL stability. Moreover, we find that Hsp90 also regulates the stability of the upstream RIP3 kinase. Interference with Hsp90 function with the 17AAG inhibitor destabilizes MLKL and RIP3, resulting in their degradation by the proteasome pathway. Furthermore, we find that Hsp90 is required for TNF-stimulated necrosome assembly. Disruption of Hsp90 function prevents necrosome formation and strongly reduces MLKL phosphorylation and inhibits TNF-induced necroptosis. Consistent with a positive role of Hsp90 in necroptosis, coexpression of Hsp90 increases MLKL oligomerization and plasma membrane translocation and enhances MLKL-mediated necroptosis."

According to the news reporters, the research concluded: "Our findings demonstrate that an efficient necrotic response requires a functional Hsp90."

For more information on this research see: Hsp90 modulates the stability of MLKL and is required for TNF-induced necroptosis. Cell Death & Disease, 2016;7():e2089. (Nature Publishing Group - www.nature.com/; Cell Death & Disease - www.nature.com/cddis/)

Studies from Y. Manse et al Have Provided New Data on Medicinal Chemistry (Melanogenesis inhibitory activity of a 7-O-9 ' -linked neolignan from Alpinia galanga fruit)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Health and Medicine - Medicinal Chemistry is now available. According to news originating from Osaka, Japan, by NewsRx correspondents, research stated, "An aqueous acetone extract from the fruit of Alpinia galanga (Zingiberaceae) demonstrated inhibitory effects on melanogenesis in theophylline-stimulated murine B16 melanoma 4A5 cells (IC50 = 7.3 mu g/mL). Through bioassay-guided separation of the extract, a new 7-O-9'-linked neolignan, named galanganol D diacetate (1), was isolated along with 16 known compounds including 14 phenylpropanoids (2-15)."

Our news journalists obtained a quote from the research, "The structure of 1, including its absolute stereochemistry in the C-7 position, was elucidated by means of extensive NMR analysis and total synthesis. Among the isolates, 1 (IC50 = 2.5 mu M), 1'S-1'-acetoxychavicol acetate (2, 5.0 mu M), and 1'S-1'-acetoxyeugenol acetate (3, 5.6 mu M) exhibited a relatively potent inhibitory effect without notable cytotoxicity at effective concentrations. The following structural requirements were suggested to enhance the inhibitory activity of phenylpropanoids on melanogenesis: (i) compounds with 4-acetoxy group exhibit higher activity than those with 4-hydroxy group; (ii) 3-methoxy group dose not affect the activity; (iii) acetylation of the 1'-hydroxy moiety enhances the activity; and (iv) phenylpropanoid dimers with the 7-O-9'-linked neolignan skeleton exhibited higher activity than those with the corresponding monomer. Their respective enantiomers [1' (IC50 = 1.9 mu M) and 20 (4.5 mu M)] and racemic mixtures [(+/-)-1 (2.2 mu M) and (+/-)-2 (4.4 mu M)] were found to exhibit melanogenesis inhibitory activities equivalent to those of the naturally occurring optical active compounds (1 and 2)."

According to the news editors, the research concluded: "Furthermore, the active compounds 1-3 inhibited tyrosinase, tyrosine-related protein (TRP)-1, and TRP-2 mRNA expressions, which could be the mechanism of melanogenesis inhibitory activity."

The news correspondents report that additional information may be obtained from T. Morikawa, Kindai Univ, Antiaging Center, Osaka 5778502, Japan. Additional authors for this research include K. Ninomiya, R. Nishi, I. Kamei, Y. Katsuyama, T. Imagawa, S. Chaipech, O. Muraoka and T. Morikawa.

Gram-Negative Bacteria - Enterobacter cloacae

Studies from Y.Y. Cai et al in the Area of Enterobacter cloacae Described (In Vitro Activity of Polymyxin B in Combination with Various Antibiotics against Extensively Drug-Resistant Enterobacter cloacae with Decreased Susceptibility to ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Gram-Negative Bacteria - Enterobacter cloacae. According to news reporting out of Singapore, Singapore, by NewsRx editors, research stated, "Against extensively drug-resistant (XDR) Enterobacter cloacae, combination antibiotic therapy may be the only option. We investigated the activity of various antibiotics in combination with polymyxin B using time-kill studies (TKS)."

Funders for this research include MOH | National Medical Research Council (NMRC), Pfizer (Pfizer Inc.), Singapore General Hospital (SGH).

Our news journalists obtained a quote from the research, "TKS were conducted with four nonclonal XDR E. cloacae isolates with 5 log(10) CFU/ml bacteria against maximum, clinically achievable concentrations of polymyxin B alone and in two-drug combinations with 10 different antibiotics. A hollow-fiber infection model (HFIM) simulating clinically relevant polymyxin B and tigecycline dosing regimens was conducted for two isolates over 240 h. Emergence of resistance was quantified using antibiotic-containing (3 x MIC) media. Biofitness and stability of resistant phenotypes were determined. All XDR E. cloacae isolates were resistant to all antibiotics except for polymyxin B (polymyxin B MIC, 1 to 4 mg/liter). All isolates harbored metallo-beta-lactamases (two with NDM-1, two with IMP-1). In single TKS, all antibiotics alone demonstrated regrowth at 24 h, except amikacin against two strains and polymyxin B and meropenem against one strain each. In combination TKS, only polymyxin B plus tigecycline was bactericidal against all four XDR E. cloacae isolates at 24 h. In HFIM, tigecycline and polymyxin B alone did not exhibit any killing activity. Bactericidal kill was observed at 24 h for both isolates for polymyxin B plus tigecycline; killing was sustained for one isolate but regrowth was observed for the second. Phenotypically stable resistant mutants with reduced in vitro growth rates were observed. Polymyxin B plus tigecycline is a promising combination against XDR E. cloacae."

According to the news editors, the research concluded: "However, prolonged and indiscriminate use can result in resistance emergence."

For more information on this research see: In Vitro Activity of Polymyxin B in Combination with Various Antibiotics against Extensively Drug-Resistant Enterobacter cloacae with Decreased Susceptibility to Polymyxin B. Antimicrobial Agents and Chemotherapy, 2016;60(9):5238-5246. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Complementary and Alternative Medicine - Herbal...

Studies from Y.Y. Yang and Co-Researchers in the Area of Herbal Medicine Reported (Analysis of pharmaceutical products and herbal medicines using ambient mass spectrometry)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Complementary and Alternative Medicine - Herbal Medicine are discussed in a new report. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Pharmaceutical analysis is an important approach to understand the active pharmaceutical ingredients and impurities in pharmaceutical products and herbal medicines, as well as to develop novel methodologies for their quality assessment and control."

Financial support for this research came from Scientific and Technological Project of Guangdong Province.

Our news editors obtained a quote from the research, "The development of ambient mass spectrometry (MS) in the beginning of the 21st century provides us with the opportunity for conducting rapid and straight-forward analysis of pharmaceutical products and herbal medicines. In this study, we review the field of ambient MS on the analyses of pharmaceutical products and herbal medicines that have been published to date."

According to the news editors, the research concluded: "The ambient ionization techniques applied for analysis of pharmaceutical products and herbal medicines are summarized and commented, with analytical strategies emphasized, and the typical analyses and applications are discussed."

The news editors report that additional information may be obtained by contacting Y.Y. Yang, China Natl Analyt Center Guangzhou, Guangdong Prov Public Lab Anal & Testing Technol, Guangzhou 510070, Guangdong, People's Republic of China.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.trac.2016.04.011. This DOI is a link to an online electronic document that is either free or for purchase.

Studies from Yale University Have Provided New Data on Cardiovascular Diseases (Comprehensive Strategies to Reduce Readmissions in Older Patients With Cardiovascular Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases is the subject of a report. According to news reporting from New Haven, Connecticut, by NewsRx editors, the research stated, "Older adults are frequently readmitted to the hospital soon after hospitalization for common cardiovascular conditions. Yet there are few high-quality data on the best strategies to reduce short-term readmissions because most studies have involved small numbers of participants, single-centre design, and strong susceptibility to bias."

The news correspondents obtained a quote from the research from Yale University, "Despite these limitations in the literature, a clear signal exists that most studies involving a singular type of intervention, a singular type of health provider, or a low intensity of intervention have failed to reduce readmissions. In contrast, interventions that are most likely to lower readmissions have used comprehensive approaches, including combined hospital and postacute care, multimodal interventions, multidisciplinary teams, or frequent longitudinal contact. Components of a comprehensive approach with the highest level of evidence include high-quality, disease-specific care; multiple transitional care interventions; involvement of multidisciplinary teams; early and frequent outpatient follow-up; and, when possible, home visits. These findings are consistent with data demonstrating that older adults have multiple sources of vulnerability and experience elevated readmission risk from a broad spectrum of medical conditions for an extended time after hospital discharge."

According to the news reporters, the research concluded: "Because readmission reduction is difficult and requires new ways of conceptualizing links between inpatient and postacute care, financial incentives may ultimately be required to motivate hospitals and health systems to redesign care processes, deploy new resources, and collaborate with out-of-hospital providers and organizations."

Our news journalists report that additional information may be obtained by contacting K. Dharmarajan, Yale New Haven Med Center, Center Outcomes Res & Évaluat, New Haven, CT 06504, United States.

Studies from Yang Ming National University Yield New Information about Prostheses (Risk of infection is associated more with drain duration than daily drainage volume in prosthesis-based breast reconstruction A cohort study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Prostheses are presented in a new report. According to news reporting from Taipei, Taiwan, by NewsRx journalists, research stated, "In prosthesis-based breast reconstruction, drains are used to prevent seroma formation and to reduce the risk of infection. However, prolonged drainage increases the risk of ascending infection."

The news correspondents obtained a quote from the research from Yang Ming National University, "Although the volume often accepted for drain removal is <= 30 mL per day, the optimal timing to remove the drain for best clinical outcome remains controversial. We did a retrospective cohort study of 569 patients of prosthesis-based breast reconstruction with infection rate as the outcome variable; drain duration and last daily drainage volume as the main independent variables. Data on age, smoking history, diabetes mellitus history, body mass index, breast weight, tissue expander size, drain size, number of retrieved lymph nodes, tumor size, number of metastatic lymph nodes, tumor stage, mastectomy type, reconstruction type, submuscular implantation, skin defect, operative time, duration of antibiotics use, chemotherapy, and radiotherapy were collected as covariates. Multivariable logistic regression analysis was used to control for confounding. The total infection rate was 5.1%(29/569). The daily drainage volume >= 30mL/d at the time of drain removal was not found associated with increased infection rate (P=0.32). Of the various cutoff values of last daily drainage volume, none was found to be a determinant for drain removal where the risk of infection was concerned. By contrast, drain duration over 21 days significantly increased infection rate (P=0.001). The multivariable logistic regression analysis showed an increase of 76.2% in the infection rate with each additional week of drain retention (P=0.001). Breast weight also had a significant influence on risk of infection. Chemotherapy and drain size showed borderline effect on risk of infection whereas the last daily drainage volume was not associated with risk of infection. In summary, our study revealed that drain duration, rather than the last daily drainage volume, significantly affects the infection rate in prosthesis-based breast reconstruction."

According to the news reporters, the research concluded: "We recommend that the drain is better removed no longer than 3 weeks postoperatively and can be removed as early as postoperative day 7, even when the drainage is over 30 mL in a 24-hour period."

For more information on this research see: Risk of infection is associated more with drain duration than daily drainage volume in prosthesis-based breast reconstruction A cohort study. Medicine, 2016;95(49):556-561. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Studies from Yeditepe University School of Medicine Yield New Data on Clinical Trials and Studies (Effects of a fentanyl-propofol mixture on propofol injection pain: a randomized clinical trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Clinical Research - Clinical Trials and Studies is the subject of a report. According to news originating from Istanbul, Turkey, by NewsRx correspondents, research stated, "Propofol injection pain is a common problem that can be very distressing for patients. We compared the effects of injection with saline followed by injection with a fentanyl-propofol mixture, injection with fentanyl followed by a propofol injection, and injection with saline followed by propofol alone on propofol injection pain."

Our news journalists obtained a quote from the research from the Yeditepe University School of Medicine, "The patients were assigned randomly to one of three groups. A rubber tourniquet was placed on the forearm to produce venous occlusion for 1 min. Before anesthesia induction, group C (control, n=50) and group M (fentanyl-propofol mixture, n=50) received 5 ml of isotonic saline, while group F (fentanyl, n=50) received 2 µg/kg of fentanyl. After the tourniquet was released, groups C and F received 5 ml of propofol and group M received 5 ml of a mixture containing 20 ml of propofol and 4 ml of fentanyl. At 10 s after the study drugs were given, a standard question about the comfort of the injection was asked of the patient. We used a verbal rating scale to evaluate propofol injection pain. Statistical analyses were performed with Student’s t-tests and Fisher's exact tests; p<0.05 was considered to indicate statistical significance. The demographic data were similar among the groups. In group M, the number of patients reporting propofol injection pain was significantly lower than in groups F and C (both p<0.001). No patient in group F or M experienced severe pain, whereas 24 patients (48%) had severe pain in group C (both p<0.001)."

According to the news editors, the research concluded: "This study shows that a fentanyl-propofol mixture was more effective than fentanyl pretreatment or a placebo in preventing propofol injection pain."

The news correspondents report that additional information may be obtained from N. Kizilcik, Dept. of Anesthesiology and Reanimation, Yeditepe University School of Medicine, Istanbul, Turkey. Additional authors for this research include F. Menda, S. Bilgen, O. Keskin and O. Koner.

Studies from Yeungnam University Describe New Findings in Antimicrobials (Antimicrobial bioactive compounds from marine algae: A mini review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antimicrobials have been presented. According to news originating from Gyongsan, South Korea, by NewsRx editors, the research stated, "Research on natural products from marine algae has increased dramatically since last few decades. Marine natural products provide a rich source of chemically diverse compounds which have significant potential to be developed as novel types of therapeutic agents."

Our news journalists obtained a quote from the research from Yeungnam University, "Certain marine products diverse in biological and therapeutic potential have been found to exhibit significant antimicrobial effects against number of harmful pathogens. Among them, marine macro-algae are considered as an excellent source of bioactive compounds which have a broad range of biological activities including antibacterial, antifungal and antiviral potential. In this article, we review the biological potential of bioactive compounds derived from marine algae with a proposed outline of their antimicrobial mechanism of action. In addition, we have also given emphasis on recent advances of secondary metabolites from marine resources along with their pharmacological effects and other uses in human food."

According to the news editors, the research concluded: "A brief discussion on the chemical nature of marine-based bioactive compounds has also been presented."

For more information on this research see: Antimicrobial bioactive compounds from marine algae: A mini review. *Indian Journal of Geo-Marine Sciences*, 2016;45(9):1076-1085. *Indian Journal of Geo-Marine Sciences* can be contacted at: Natl Inst Science Communication-Niscair, Dr K S Krishnan Marg, Pusa Campus, New Delhi 110 012, India.

Studies from Yokohama City University Further Understanding of Heart Attack (Association between epicardial adipose tissue volume and myocardial salvage in patients with a first ST-segment elevation myocardial infarction: An epicardial adipose ...)

Heart Disorders and Diseases - Heart Attack

Studies from Yokohama City University Further Understanding of Heart Attack (Association between epicardial adipose tissue volume and myocardial salvage in patients with a first ST-segment elevation myocardial infarction: An epicardial adipose ...
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Attack have been published. According to news reporting originating in Kanagawa, Japan, by NewsRx journalists, research stated, "Epicardial adipose tissue (EAT), defined as the adipose tissue between the visceral pericardium and the outer margin of the myocardium, is associated with coronary artery disease in the general population. However, the clinical implications of EAT in patients with ST-segment elevation myocardial infarction (STEMI) remain unclear."

The news reporters obtained a quote from the research from Yokohama City University, "A total of 142 patients with a first STEMI, who received reperfusion therapy within 12 h from symptom onset, were enrolled. All patients underwent cardiac magnetic resonance imaging to evaluate infarct core (Core), area at risk (AAR), and EAT volume. Myocardial salvage index (MSI) was defined as AAR minus Core divided by AAR. Patients in the lower tertile of EAT volume were classified as the low EAT group (group L) and the other two-thirds as the high EAT group (group H). The mean MSI was lower in group L than in group H (0.43 +/- 0.13 vs 0.49 +/- 0.13, p = 0.01), and the mean extent of Core was higher in group L than in group H (25 +/- 10% vs 19 +/- 10%, p< 0.01). Multivariate linear regression analysis including coronary risk factors and previously reported predictors of infarct size demonstrated that EAT volume was an independent predictor of MSI (beta coefficient = 0.002 per 1 mL, p = 0.002)."

According to the news reporters, the research concluded: "A lower EAT volume is associated with less myocardial salvage and larger infarct size in patients with a first STEMI."

For more information on this research see: Association between epicardial adipose tissue volume and myocardial salvage in patients with a first ST-segment elevation myocardial infarction: An epicardial adipose tissue paradox. *Journal of Cardiology*. 2016;68(5-6):399-405. *Journal of Cardiology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Oncology - Colon Cancer**

**Studies from Yokohama City University Update Current Data on Colon Cancer (Anticancer effect of linalool via cancer-specific hydroxyl radical generation in human colon cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Colon Cancer. According to
news reporting originating from Kanagawa, Japan, by NewsRx correspondents, research stated, "To investigate the anticancer mechanisms of the monoterpenoid alcohol linalool in human colon cancer cells. The cytotoxic effect of linalool on the human colon cancer cell lines and a human fibroblast cell line was examined using the WST-8 assay."

Our news editors obtained a quote from the research from Yokohama City University, "The apoptosis-inducing effect of linalool was measured using the terminal deoxynucleotidyl transferase dUTP nickend labeling assay and flow cytometry with Annexin V. Oxidative stress was investigated by staining for diphenyl-1-pyrenylphosphine, which is a cellular lipid peroxidation marker, and electron spin resonance spectroscopy. Sixteen SCID mice xenografted with human cancer cells were randomized into 3 groups for in vivo analysis: control and low-dose and high-dose linalool groups. The control group was administered tap water orally every 3 d. The linalool treatment groups were administered 100 or 200 μg/kg linalool solution orally for the same period. All mice were sacrificed under anesthesia 21 d after tumor inoculation, and tumors and organs were collected for immunohistochemistry using an anti-4-hydroxynonenal antibody. Tumor weights were measured and compared between groups. Linalool induced apoptosis of cancer cells in vitro, following the cancer-specific induction of oxidative stress, which was measured based on spontaneous hydroxyl radical production and delayed lipid peroxidation. Mice in the high-dose linalool group exhibited a 55% reduction in mean xenograft tumor weight compared with mice in the control group (P < 0.05). In addition, tumor-specific lipid peroxidation was observed in the in vivo model."

According to the news editors, the research concluded: "Linalool exhibited an anticancer effect via cancer-specific oxidative stress, and this agent has potential for application in colon cancer therapy."

The news editors report that additional information may be obtained by contacting Y.W. Zheng, Yokohama City University, Dept. of Regenerat Med, Grad Sch Med, Yokohama, Kanagawa 2360004, Japan. Studies from Yonsei University Yield New Data on Antineoplastic Monoclonal Antibodies (Treatment preferences of advanced ovarian cancer patients for adding bevacizumab to first-line therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antineoplastic Monoclonal Antibodies. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "The GOG-218 and ICON-7 studies recently showed that adding bevacizumab to first-line therapy for patients with advanced ovarian cancer increased progression-free survival. However, the high cost and long treatment duration prevents the incorporation of bevacizumab in practice."

Our news editors obtained a quote from the research from Yonsei University, "The aim of this study was to explore and quantify patients' preferences for adding bevacizumab to first-line therapy. A discrete choice experiment (DCE) and trade-off question were designed and distributed to 102 ovarian cancer patients. Participants were asked to choose between two hypothetical first-line therapies that differed in terms of effectiveness, safety, and the financial burden. A trade-off technique varying the cost of bevacizumab was used to quantify a willingness-to-pay threshold for selecting bevacizumab. All attributes of the DCE had a statistically significant impact on respondents' preferences and the financial burden was the most important attribute. The results of the trade-off question showed that more than half of patients would prefer to add bevacizumab to standard chemotherapy when the cost of the drug was reduced to 17% (1/6) of the baseline cost. Patients' preferences for bevacizumab in the adjuvant treatment of ovarian cancer depend primarily on drug costs."

According to the news editors, the research concluded: "Our results suggest that the current cost of bevacizumab is sufficiently high that the majority of ovarian cancer patients are not willing to pay to accept a small increase in progression-free survival."

For more information on this research see: Treatment preferences of advanced ovarian cancer patients for adding bevacizumab to first-line therapy. Gynecologic Oncology, 2016;143(3):622-627. Gynecologic Oncology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Leukocyte Diseases and Conditions - Leukocytosis

Studies from Yonsei University Yield New Information about Leukocytosis (Tumor-related leukocytosis is associated with poor radiation response and clinical outcome in uterine cervical cancer patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Leukocyte Diseases and Conditions - Leukocytosis are presented in a new report. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "To evaluate response to radiation and clinical outcome of uterine cervical cancer patients with tumor-related leukocytosis (TRL) at initial diagnosis and during definitive radiotherapy. We retrospectively analyzed 2456 patients with stage IA-IVA uterine cervical cancer who received definitive radiotherapy with (37.4%) or without (62.6%) platinum-based chemotherapy between 1986 and 2012."

Our news editors obtained a quote from the research from Yonsei University, "TRL was defined as two or more occurrences of leukocytosis over 9000/μl at the time of diagnosis and during the course of treatment. Locoregional failure-free survival (LFFS) and overall survival (OS) were compared between patients with or without TRL. The median age of all patients was 55 years, and the median follow-up time was 65.1 months. TRL was observed in 398 patients (16%) at initial diagnosis; TRL (+) patients were younger and had larger tumors, advanced stage, and more frequent lymph node metastases (allP < 0.05). TRL (+) patients showed a significantly lower rate of complete remission than TRL (-) patients (89.9% versus 96.3%, respectively, P = 0.042). Ten-year LFFS and OS for all patients were 84% and 78%, respectively. LFFS and OS were significantly lower in TRL (+) patients than TRL (-) patients (10-year LFFS: 69% versus 87% respectively, P < 0.001; 10-year OS: 63% versus 81% respectively P < 0.001). After propensity score matching, LFFS and OS rates in TRL (+) patients remained significantly lower than for TRL (-) patients; this significant difference was also observed on multivariate analysis. Twenty-six percent of patients with locoregional failure (n = 345) were TRL (+) and had significantly poorer median OS (6 versus 12 months, P = 0.001). This study reveals the aggressive nature of cervical cancer with TRL and its poor response to radiation therapy."

According to the news editors, the research concluded: "Given the unfavorable prognosis and higher probability of treatment failure, optimal diagnostic and therapeutic approaches and careful monitoring for early detection of recurrence should be considered for these patients."

The news editors report that additional information may be obtained by contacting Y.B. Kim, Yonsei University, Coll Med, Yonsei Song Dang Inst Canc Res, Seoul, South Korea. Additional authors for this research include K.H. Kim, H.I. Yoon, G.E. Kim and Y.B. Kim.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/annonc/mdw308. This DOI is a link to an online electronic document that is either free or for purchase.
Oncology - Lung Cancer

Studies from Z.B. Song and Colleagues Yield New Information about Lung Cancer (Clinicopathologic characteristics, genetic variability and therapeutic options of RET rearrangements patients in lung adenocarcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Lung Cancer is now available. According to news reporting originating from Hangzhou, People's Republic of China, by NewsRx correspondents, research stated, "RET fusion gene is identified as a novel oncogene in a subset of non-small cell lung cancer (NSCLC). However, few data are available about the prevalence, clinicopathologic characteristics, genetic variability and therapeutic options in RET-positive lung adenocarcinoma patients."

Our news editors obtained a quote from the research, "For 615 patients with lung adenocarcinoma, RET status was detected by reverse transcription-polymerase chain reaction (RT-PCR). Next-generation sequencing (NGS) and FISH were performed in positive cases. Thymidylate synthetase (TS) mRNA level was assayed by RT-PCR. Overall survival (OS) was evaluated by Kaplan-Meier method and compared with log-rank test. Twelve RET-positive patients were identified by RT-PCR. However, one patient failed the detection of RET rearrangement by FISH and NGS. Totally, 11 patients (1.8%) confirmed with RET rearrangements by three methods, including six females and five males with a median age of 54 years. The presence of RET rearrangements was associated with lepidic predominant lung adenocarcinoma subtype in five of 11 patients. RET rearrangements comprised of nine KIF5B-RET and two CCDC6-RET fusions. Four patients had concurrent gene variability by NGS detection, including EGFR (n = 1), MAP2K1 (n = 1), CTNNB1 (n = 1) and AKT1 (n = 1). No survival difference existed between RET-positive and negative patients (58.1 vs. 52.0 months, P = 0.504). The median progression-free survival of first-line pemetrexed/platinum regimen was 7.5 months for four recurrent cases. And the level of TS mRNA was lower in RET-positive patients than that in those RET-negative counterparts (239 +/- 188 x 10^-4 vs. 394 +/- 457 x 10^-4, P = 0.019). The prevalence of RET fusion is approximately 1.8% in Chinese patients with lung adenocarcinoma. RET rearrangements are characterized by lepidic predominance and a lower TS level."

According to the news editors, the research concluded: "RET-rearranged patients may benefit more from pemetrexed-based regimen."

The news editors report that additional information may be obtained by contacting
Studies from Z.H. Wang and Colleagues Provide New Data on Ovarian Cancer (Research Progress of MicroRNA in Early Detection of Ovarian Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Ovarian Cancer have been published. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "This review aimed to update the progress of microRNA (miRNA) in early detection of ovarian cancer. We discussed the current clinical diagnosis methods and biomarkers of ovarian cancer, especially the methods of miRNA in early detection of ovarian cancer."

Our news journalists obtained a quote from the research, "We collected all relevant studies about miRNA and ovarian cancer in PubMed and CNKI from 1995 to 2015. We included all relevant studies concerning miRNA in early detection of ovarian cancer, and excluded the duplicated articles. miRNAs play a key role in various biological processes of ovarian cancer, such as development, proliferation, differentiation, apoptosis and metastasis, and these phenomena appear in the early-stage. Therefore, miRNA can be used as a new biomarker for early diagnosis of ovarian cancer, intervention on miRNA expression of known target genes, and potential target genes can achieve the effect of early prevention. With the development of nanoscience and technology, analysis methods of miRNA are also quickly developed, which may provide better characterization of early detection of ovarian cancer."

According to the news editors, the research concluded: "In the near future, miRNA therapy could be a powerful tool for ovarian cancer prevention and treatment, and combining with the new analysis technology and new nanomaterials, point-of-care tests for miRNA with high throughput, high sensitivity, and strong specificity are developed to achieve the application of diagnostic kits in screening of early ovarian cancer."

Our news journalists report that additional information may be obtained by contacting C.J. Xu, Shanghai Key Laboratory of Female Reproductive Endocrine Related Diseases, Shanghai 200011, People's Republic of China.

The direct object identifier (DOI) for that additional information is:
Studies from Zhejiang Chinese Medical University Reveal New Findings on Gastric Cancer [Deacetylisovaltratum disrupts microtubule dynamics and causes G(2)/M-phase arrest in human gastric cancer cells in vitro]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gastric Cancer. According to news reporting out of Hangzhou, People's Republic of China, by NewsRx editors, research stated, "Deacetylisovaltratum (DI) is isolated from the traditional Chinese herbal medicine Patrinia heterophylla Bunge, which exhibits anti-cancer activity. Here, we investigated the effects of DI on human gastric carcinoma cell lines in vitro and elucidated its anti-cancer mechanisms."

Our news journalists obtained a quote from the research from Zhejiang Chinese Medical University, "Human gastric carcinoma AGS and HGC-27 cell lines were treated with DI, and cell viability was detected with MTT assay. Cell cycle stages, apoptosis and mitochondrial membrane potential were measured using flow cytometry. Protein levels were analyzed by Western blotting. Tubulin polymerization assays and immunofluorescence were used to characterize the tubulin polymerization process. DI inhibited the cell viability of AGS and HGC-27 cells in a dose-and time-dependent manner with IC50 values of 12.0 and 28.8 μmol/L, respectively, at 24 h of treatment. Treatment with DI (10-100 μmol/L) dose-dependently promoted tubulin polymerization, and induced significant G(2)/M cell cycle arrest in AGS and HGC-27 cells. Moreover, DI treatment disrupted mitochondrial membrane potential and induced caspase-dependent apoptosis in AGS and HGC-27 cells."

According to the news editors, the research concluded: "DI induces G(2)/M-phase arrest by disrupting tubulin polymerization in human gastric cancer cells, which highlights its potent anti-cancer activity and potential application in gastric cancer therapy."

Our news journalists report that additional information may be obtained by contacting N.M. Lin, Zhejiang Chinese Med Univ, Coll Pharmaceut Sci, Hangzhou 310053, Zhejiang, People's Republic of China. Additional authors for this research include B. Zhang,

Proteins - DNA-Binding Proteins

Studies from Zhejiang University Add New Findings in the Area of DNA-Binding Proteins (Activation of liver X receptor attenuates lysophosphatidylcholine-induced IL-8 expression in endothelial cells via the NF-kappa B pathway and SUMOylation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Proteins - DNA-Binding Proteins is now available. According to news originating from Hangzhou, People's Republic of China, by NewsRx correspondents, research stated, "The liver X receptor (LXR) is a cholesterol-sensing nuclear receptor that has an established function in lipid metabolism; however, its role in inflammation is elusive. In this study, we showed that the LXR agonist GW3965 exhibited potent anti-inflammatory activity by suppressing the firm adhesion of monocytes to endothelial cells."

Our news journalists obtained a quote from the research from Zhejiang University, "To further address the mechanisms underlying the inhibition of inflammatory cell infiltration, we evaluated the effects of LXR agonist on interleukin-8 (IL-8) secretion and nuclear factor-kappa B (NF-kappa B) activation in human umbilical vein endothelial cells (HUVECs). The LXR agonist significantly inhibited lysophosphatidylcholine (LPC)-induced IL-8 production in a dose-dependent manner without appreciable cytotoxicity. Western blotting and the NF-kappa B transcription activity assay showed that the LXR agonist inhibited p65 binding to the IL-8 promoter in LPC-stimulated HUVECs. Interestingly, knockdown of the indispensable small ubiquitin-like modifier (SUMO) ligases Ubc9 and Histone deacetylase 4 (HDAC4) reversed the increase in IL-8 induced by LPC. Furthermore, the LPC-induced degradation of inhibitory kappa B alpha was delayed under the conditions of deficient SUMOylation or the treatment of LXR agonist. After enhancing SUMOylation by knockdown SUMO-specific protease Sentrin-specific protease 1 (SENP1), the inhibition of GW3965 was rescued on LPC-mediated IL-8 expression. These findings indicate that LXR-mediated inflammatory gene repression correlates to the suppression of NF-kappa B pathway and SUMOylation."

According to the news editors, the research concluded: "Our results suggest that LXR agonist exerts the anti-atherosclerotic role by attenuation of the NF-kappa B pathway in endothelial cells."

The news correspondents report that additional information may be obtained from
Studies from Zhejiang University Further Understanding of Diamond-Blackfan Anemia (A new in-frame deletion in ribosomal protein S19 in a Chinese infant with Diamond-Blackfan anemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hematologic Diseases and Conditions - Diamond-Blackfan Anemia are discussed in a new report. According to news reporting originating in Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "Diamond-Blackfan anemia (DBA) is a congenital erythroid aplasia that usually presents as macrocytic anemia during infancy. Ribosomal protein S19 (RPS19) is identified as the first gene associated with DBA."

Financial supporters for this research include National Natural Science Foundation of China, Zhejiang Provincial Natural Science Foundation.

The news reporters obtained a quote from the research from Zhejiang University, "RPS19 is mutated in 25% of DBA patients, but its role in DBA pathogenesis remains to be elucidated. We have identified a novel heterozygous frameshift mutation in RPS19 gene in a DBA child presenting with profound anemia after birth. A single nucleotide heterozygous deletion (C.251delG) results in frameshift in RPS19 gene in exon 4 at codon 84 with possible premature stop codon (p.Arg84LysfsX21). The mutant allele was not detected in her parents, indicating de novo mutation. Both alleles were expressed at the same level. Using an immunofluorescence technique, the mutated-type RPS19 expressions were mostly localized to entire nuclei with little staining for nucleoli and its intracellular localization significantly differed from the wild-type RPS19, which was localized to both nuclei and nucleoli."

According to the news reporters, the research concluded: "This type of a mutation could be very helpful in further understanding the role of the RPS19 protein in DBA pathogenesis."

For more information on this research see: A new in-frame deletion in ribosomal protein S19 in a Chinese infant with Diamond-Blackfan anemia. Blood Cells Molecules and Diseases, 2016;62():1-5. Studies from Zhejiang University Update Current Data on Breast Cancer (The Role of E-cadherin-160C/A Polymorphism in Breast Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting originating in Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "Breast cancer is the most prevalent cancer in women worldwide. Numerous studies have suggested that the E-cadherin adhesion system is dysregulated in cancer cells."

The news reporters obtained a quote from the research from Zhejiang University, "These impaired functions of E-cadherin contribute to releasing cancer cells from the primary lesion to cell dedifferentiation. Some studies have shown that polymorphism may affect E-cadherin expression, and then play a role in susceptibility to breast cancer. However, the results remained controversial. In this short review, we summarize the functions of E-cadherin and the signaling pathways it regulates, and assess the association between CDH1 polymorphisms and breast cancer susceptibility. This study suggests that genetic variation in CDH1 and -160C/A polymorphism may have an association with breast cancer risk."

According to the news reporters, the research concluded: "The assessment of CDH1 polymorphisms may be used for the identification of patients suitable for anti-CDH1 therapy."

For more information on this research see: The Role of E-cadherin-160C/A Polymorphism in Breast Cancer. Open Life Sciences, 2016;11(1):110-115. Open Life Sciences can be contacted at: De Gruyter Open Ltd, Bogumila Zuga 32A St, 01-811 Warsaw, Poland.

Drugs and Therapies - Docetaxel Therapy

Studies from Zhejiang University Update Current Data on Docetaxel Therapy (Sequentially dual-targeting vector with nano-in-micro structure for improved docetaxel oral delivery in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Docetaxel Therapy. According to news reporting originating from Hangzhou, People's Republic of China, by NewsRx correspondents, research stated, "In this study, we constructed a novel vector (BioPf-M-loaded Alg-microparticles [Alg-BioPf-M]) with nano-in-micro structure to improve the oral absorption of docetaxel (DTX) by sequentially dual-targeting functions toward intestine and sodium-dependent multivitamin transporter based on entrapping biotin-modified micelles into alginate microparticles."

Our news editors obtained a quote from the research from Zhejiang University, "A series of characteristics of this system was investigated, such as drug release, cellular uptake, transport pathway and the comprehensive in vivo studies including pharmacokinetic studies, anti-tumor activity and toxicity study. The bioavailability of DTX-loaded Alg-BioPf-M was 27.4-fold higher than that of free DTX after oral administration and achieved superior tumor inhibition of 84.6% against sarcoma 180 tumors."

According to the news editors, the research concluded: "These results demonstrated that the Alg-BioPf-M was a promising vector for oral delivery of DTX."

The news editors report that additional information may be obtained by contacting L.Y. Qiu, Zhejiang University, Dept. of Polymer Sci & Engn, Key Lab Macromol Synth & Functionalizat, MOE, Hangzhou 310027, People's Republic of China. Additional authors for this research include M.Y. Hu and L.Y. Qiu.

Inflammation

Studies from Zhejiang University of Technology in the Area of Inflammation Described (From the Cover: Exposure to Oral Antibiotics Induces Gut Microbiota Dysbiosis Associated with Lipid Metabolism Dysfunction and Low-Grade Inflammation in Mice)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Inflammation. According to news originating from Hangzhou, People's Republic of China, by NewsRx correspondents, research stated, "Due to a long history of improper and excessive use, Penicillin G (Pen G) and erythromycin (Ery) are regularly detected in environmental samples and pose a great threat to human health. Here, we set out to investigate effects of Pen G, Ery or their mixture on lipid metabolism and gut microbiota in order to better understand their toxicological mechanisms."

Our news journalists obtained a quote from the research from the Zhejiang University of Technology, "Male C57BL/6J mice were exposed either to 60 mu g/ml Pen G, Ery or a half mixture of both for 6 weeks or to 10 mu g/ml Pen G, Ery or a half mixture of both for 14 weeks. In a recovery experiment, male mice were exposed to 60 mu g/ml Pen G or Ery for 2 weeks and then maintained without antibiotics for up to 8 weeks. It was observed that oral exposure to Pen G, Ery or their mixture induced lipid metabolism dysfunction, characterized by significantly increased lipid accumulations, triglycerides (TG) levels and expression of key genes involved in free fatty acid (FFA) synthesis, FFA transport and TG synthesis in the liver. In addition, Pen G and Ery exposure induced an inflammatory response as indicated by the increase of serum lipopolysaccharide levels and the up-regulation of key genes that regulate immune responses in the liver, fat, colon and ileum. Moreover, Pen G and Ery exposure rapidly and dramatically altered the composition of the microbiota in feces and cecum. Furthermore, high throughput sequencing of V3-V4 region of bacterial 16S rRNA gene revealed additional significant changes in the cecal microbiota of antibiotics-treated mice. Importantly, it took a very long time to reconstitute the normal composition of the gut microbiota after it was imbalanced by antibiotics exposure."

According to the news editors, the research concluded: "Orally administered Pen G and Ery (especially to the latter) can induce gut microbiota dysbiosis, which may indirectly link antibiotic exposure to host metabolic disorders and inflammation."

The news correspondents report that additional information may be obtained from Z.W. Fu, Zhejiang University of Technology, Coll Biotechnol & Bioengn, Hangzhou 310032, Zhejiang, People's Republic of China. Additional authors for this research include Y. Wu, Z.Y. Zeng, C.Y. Jin, S.S. Hela Cells

Studies from Zhengzhou University Describe New Findings in Hela Cells (Inhibition of Cervical Cancer by Promoting IGFBP7 Expression Using Ellagic Acid from Pomegranate Peel)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hela Cells are presented in a new report. According to news reporting out of Zhengzhou, People's Republic of China, by NewsRx editors, research stated, "The aim of this study was to explore the mechanism by which cervical cancer is inhibited by promoting IGFBP7 expression using ellagic acid from pomegranate peel extract. HeLa cells were divided into 6 groups: control group (NC), blank control group (BL), and IGFBP7 overexpression group (IGFBP7), and 2.5 uM, 5.0 uM, and 10.0 uM ellagic acid-treated groups."

Our news journalists obtained a quote from the research from Zhengzhou University, "The cell proliferation ability was detected and the degree of invasion in the 6 groups was measured by Transwell assay. The expression levels of IGFBP7 and AKT/mTOR in the 6 groups of cells were detected by RT-PCR technique. Compared with NC and BL groups, The IGFBP7 gene expressions of the IGFBP7 and ellagic acid-treated groups were significantly increased (P < 0.05). There was a dose-effect dependence in the ellagic acid-treated groups. The invasion ability of the IGFBP7 group and ellagic acid-treated groups was significantly lower than that of NC and BL groups in HeLa cells (P < 0.05). The apoptosis rate of the IGFBP7 group and ellagic acid-treated groups was significantly higher than that of the NC and BL groups in HeLa cells (P < 0.05). AKT and mTOR mRNA and protein expressions of the IGFBP7 group and ellagic acid-treated groups were significantly lower than that of the NC and BL groups (P < 0.05). There was a dose-effect dependence in the ellagic acid-treated groups."

According to the news editors, the research concluded: "The ellagic acid in pomegranate peel extract can inhibit the AKT/mTOR signaling pathway by enhancing the expression level of IGFBP7, which can inhibit the HeLa cells in cervical cancer."

For more information on this research see: Inhibition of Cervical Cancer by Promoting IGFBP7 Expression Using Ellagic Acid from Pomegranate Peel. Medical Science Monitor, 2016;22():4881-4886. **Heart Disorders and Diseases - Tetralogy of Fallot**

**Studies from Zhengzhou University Have Provided New Data on Tetralogy of Fallot (Application of array-comparative genomic hybridization in tetralogy of Fallot)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Tetralogy of Fallot. According to news originating from Zhengzhou, People's Republic of China, by NewsRx correspondents, research stated, "To explore the underlying pathogenesis and provide references for genetic counseling and prenatal gene diagnosis, we analyzed the chromosome karyotypes and genome-wide copy number variations (CNVs) in 86 patients with tetralogy of Fallot (TOF) by G-banding karyotype analysis and array-comparative genomic hybridization (aCGH), respectively. And then quantitative polymerase chain reaction was used to validate these candidate CNVs."

Our news journalists obtained a quote from the research from Zhengzhou University, "Based on their different properties, CNVs were categorized into benign CNVs, suspiciously pathogenic CNVs, and indefinite CNVs. Data analysis was based on public databases such as UCSC, DECIPHER, DGV, ISCA, and OMIM. The karyotype was normal in all the 86 patients with TOF. CNVs were detected in 11 patients by aCGH and quantitative polymerase chain reaction. Patient no. 0001, 0010, and 0029 had 2.52-Mb deletion in the chromosome 22q11.21 region; patient no. 0008 had both 595- and 428-kb duplications, respectively, in 12p12.3p12.2 and 14q23.2q23.3 regions; patient no. 0009 had 1.46-Mb duplication in the 1q21.1q21.2 region; patient no. 0016 had 513-kb duplication in the 1q42.13 region; patient no. 0024 had 292-kb duplication in the 16q11.2 region; patient no. 0026 had 270-kb duplication in the 16q24.1 region; patient no. 0028 had 222-kb deletion in the 7q31.1 region; patient no. 0033 had 1.73-Mb duplication in the 17q12 region; and patient no. 0061 had 5.79-Mb deletion in the 1p36.33p36.31 region. aCGH can accurately detect CNVs in the patients with TOF."

According to the news editors, the research concluded: "This is conducive to genetic counseling and prenatal diagnosis for TOF and provides a new clue and theoretical basis for exploring the pathogenesis of congenital heart disease."

For more information on this research see: Application of array-comparative genomic hybridization in tetralogy of Fallot. *Medicine, 2016;95(49):386-396. Medicine* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Oncology - Esophageal Cancer**

**Studies from Zhengzhou University Provide New Data on Esophageal Cancer (Human papillomavirus-related esophageal cancer survival A systematic review and meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Esophageal Cancer have been published. According to news reporting from Zhengzhou, People's Republic of China, by NewsRx journalists, research stated, "Human papillomavirus (HPV) has been identified to be related to progression of esophageal cancer. However, the results remain controversial."

The news correspondents obtained a quote from the research from Zhengzhou University, "A meta-analysis of epidemiologic studies was therefore conducted to address this issue. The electronic databases of MEDLINE and Excerpta Medica database were searched till April 30, 2016. specific risk estimates were pooled using a random-effects model. Ten studies involving a total of 1184 esophageal cancer cases were included in this meta-analysis. The pooled hazard ratio comparing HPV-positive to HPV-negative esophageal cancers was 1.03 (95% confidence interval 0.78-1.37), which was not significantly correlated with improved survival. However, HPV-16-positive patients might have a significantly favorable survival (hazard ratio 0.73, 95% confidence interval 0.44-1.21). The meta-analysis indicated that HPV infection may not be of prognostic utility in the evaluation of factors contributing to esophageal cancer."

According to the news reporters, the research concluded: "Further large prospective studies are encouraged to stratify survival analysis by HPV type."

For more information on this research see: Human papillomavirus-related esophageal cancer survival A systematic review and meta-analysis. *Medicine*, 2016;95(46):199-204. *Medicine* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Gynecology**

**Studies from Zhengzhou University Yield New Information about Gynecology (Effect of Pregnane X Receptor*1B genetic polymorphisms on postoperative analgesia with fentanyl in Chinese patients undergoing gynecological surgery)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gynecology have been presented. According to news originating from Zhengzhou, People's Republic of China, by NewsRx correspondents, research stated, "The purpose of the study was to investigate the effects of the pregnane X receptor (PXR)*1B polymorphisms on CYP3A4 enzyme activity and postoperative fentanyl consumption in Chinese patients undergoing gynecological surgery. A total of 287 females of Han ethnicity, aged 20 to 50 years old, ASA I or II, scheduled to abdominal total hysterectomy or myomectomy under general anesthesia were enrolled."

Our news journalists obtained a quote from the research from Zhengzhou University, "The analgesic model used was fentanyl consumption via patient-controlled intravenous analgesia (PCIA) in the post-operative period. Additionally, pain was assessed using a visual analog score (VAS). Pain scores, occurrence of adverse reactions and consumption of fentanyl were recorded during the 24 h postoperative period. The enzyme activity of CYP3A4 was evaluated by measuring the plasma ratio of 1'-hydroxymidazolam to midazolam 1 h after intravenous administration of 0.1 mg/kg midazolam. PXR genotyping was performed by direct DNA sequencing and the PXR*1B haplotype was analyzed via PHASE V.2.1 software. The polymorphism frequency of PXR11156A > C/11193 T> C and 8055C > T were 49.6 and 49.3%, and the rate of PXR*1B haplotype was 48.8% in our study. None of the pain scores, consumption of fentanyl 24 h post-operatively or enzyme activity of CYP3A4, showed differences among different genotypes."

According to the news editors, the research concluded: "PXR11156A > C, PXR11193T > C, PXR8055C > T or the PXR*1B haplotype do not appear to be important factors contributing to CYP3A4 activity and interindividual variations in postoperative fentanyl consumption in Han female patients undergoing gynecological surgery."

The news correspondents report that additional information may be obtained from W. Zhang, Zhengzhou Univ, Dept. of Anesthesiol, Affiliated Hosp 1, Zhengzhou 450052, People's Republic of China. Additional authors for this research include X.J. Ma, Z.S. Li, Y.Z. Chang, W. Zhang, Q.C. Kan, J.K. Hou and L.R. Zhang.

Drugs and Therapies - Antibiotics

Studies from Zunyi Medical University Describe New Findings in Antibiotics (NQO1 and CYP450 reductase decrease the systemic exposure of rifampicin-quinone and mediate its redox cycle in rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antibiotics is now available.
According to news reporting originating in Zunyi, People's Republic of China, by NewsRx journalists, research stated, "Rifampicin (RIF) is used in regimens for infections caused by Mycobacteria accompanied by serious adverse reactions. Rifampicin-quinone (RIF-Q) is a major autoxidation product of RIF."

Financial support for this research came from National Natural Science Foundation of China.

The news reporters obtained a quote from the research from Zunyi Medical University, "It is not clear whether RIF-Q plays a role in RIF induced adverse reactions. Investigation of the systemic exposure of RIF-Q is helpful to better understand the role of RIF-Q in RIF induced adverse reactions. In this study, a simple and reproducible high performance liquid chromatography-mass spectrometry (LC-MS) method involving a procedure to prevent the RIF from oxidation for simultaneous quantification of RIF and RIF-Q in rat plasma has been developed and validated, and applied to elucidate the systemic exposure of RIF-Q in rats. The pharmacokinetics data showed that the systemic exposure of RIF-Q was very low (0.67% of RIF, AUC(0-24)) in rats after oral administration of RIF. However, RIF-Q may undergo the redox cycle in vivo by the evidence that the majority of RIF-Q was reduced to RIF after an oral dose of RIF-Q Pretreatment with the NAD(P)H: quinone oxidoreductase 1 (NQO1) specific inhibitor dicoumarol and/or cytochrome P450 reductase (CPR) inhibitor diphenyleneiodonium suppressed the redox cycle and significantly increased the systemic exposure of RIF-Q. The inhibitors also attenuated the redox cycle induced reactive oxygen species formation and cytotoxicity in RIF-Q-treated HepG2 cells."

According to the news reporters, the research concluded: "These results indicate that NQO1 and CPR play an important role in redox cycle of RIF-Q and may thus contribute to RIF-induced adverse reactions."

For more information on this research see: NQO1 and CYP450 reductase decrease the systemic exposure of rifampicin-quinone and mediate its redox cycle in rats. Journal of Pharmaceutical and Biomedical Analysis, 2017;132():17-23. Journal of Pharmaceutical and Biomedical Analysis can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Pharmaceutical and Biomedical Analysis - www.journals.elsevier.com/journal-of-pharmaceutical-and-biomedical-analysis/)

Our news correspondents report that additional information may be obtained by contacting F.G. Shi, Zunyi Med Univ, Minist Educ, Key Lab Basic Pharmacol, Dept. of Pharmacol, Zunyi 563099, People's Republic of China. Additional authors for this research include X.B. Li, H. Pan and L. Ding.

Oncology - Acute Myeloid Leukemia

Studies in the Area of Acute Myeloid Leukemia Reported from Peking University (IGK with conserved IGKV/IGKJ repertoire is expressed in acute myeloid leukemia and promotes leukemic cell migration)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Acute Myeloid Leukemia are discussed in a new report. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "We have previously reported that immunoglobulin heavy chain genes were expressed in myeloblasts and mature myeloid cells. In this study, we further demonstrated that rearranged Ig k light chain was also frequently expressed in acute myeloid leukemia cell lines (6/6), primary myeloblasts from patients with acute myeloid leukemia (17/18), and mature monocytes (11/12) and neutrophils (3/12) from patients with non-hematopoietic neoplasms, but not or only rarely expressed in mature neutrophils (0/8) or monocytes (1/8) from healthy individuals."

Our news editors obtained a quote from the research from Peking University, "Interestingly, myeloblasts and mature monocytes/neutrophils shared several restricted IGKV and IGKJ gene usages but with different expression frequency. Surprisingly, almost all of the acute myeloid leukemia-derived IGKV showed somatic hypermutation; in contrast, mature myeloid cells-derived IGKV rarely had somatic hypermutation. More importantly, although IGK expression appeared not to affect cell proliferation, reduced IGK expression led to a decrease in cell migration in acute myeloid leukemia cell lines HL-60 and NB4, whereas increased IGK expression promoted their motility. In summary, IGK is expressed in myeloblasts and mature myeloid cells from patients with non-hematopoietic neoplasms, and is involved in cell migration."

According to the news editors, the research concluded: "These results suggest that myeloid cells-derived IgK may have a role in leukemogenesis and may serve as a novel tumor marker for monitoring minimal residual disease and developing target therapy."

For more information on this research see: IGK with conserved IGKV/IGKJ repertoire is expressed in acute myeloid leukemia and promotes leukemic cell migration. Oncotarget, 2015;6(36):39062-72.

The news editors report that additional information may be obtained by contacting C. Wang, Dept. of Immunology, School of Basic Medical Sciences, Peking University, Beijing, People's Republic of China. Additional authors for this research include M. Xia, X. Sun, Z. He, F. Hu, L. Chen, C.E. Bueso-Ramos, X. Qiu and C.C Yin.

Studies in the Area of Adult T-Cell Leukemia-Lymphoma Reported from University of Tokyo (Dysregulation of c-Myb Pathway by Aberrant Expression of Proto-oncogene MYB Provides the Basis for Malignancy in Adult T-cell Leukemia/lymphoma Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Adult T-Cell Leukemia-Lymphoma. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Adult T-cell leukemia/lymphoma (ATLL) is an aggressive human T-cell malignancy induced by human T-lymphotrophic virus-1 (HTLV-1) infection. The genetic alterations in infected cells that lead to transformation have not been completely elucidated, thus hindering the identification of effective therapeutic targets for ATL."

Our news journalists obtained a quote from the research from the University of Tokyo, "Here, we present the first assessment of MYB proto-oncogene dysregulation in ATL and an exploration of its role in the onset of ATL. We investigated the expression patterns of MYB splicing variants in ATL. The molecular characteristics of the c-Myb-9A isoform, which was overexpressed in ATL cells, were examined using chromatin immunoprecipitation and promoter assays. We further examined the biologic impacts of abnormal c-Myb overexpression in ATL using overall c-Myb knockdown with shRNA or c-Myb-9A knockdown with morpholino oligomers. Both total c-Myb and c-Myb-9A, which exhibited strong transforming activity, were overexpressed in ATL cells in a leukemogenesis- and progression-dependent manner. Knockdown of either total c-Myb or c-Myb-9A induced ATL cell death. c-Myb transactivates nine genes that encode essential regulators of cell proliferation and NF-kappa B signaling. c-Myb-9A induced significantly stronger transactivation of all tested genes and stronger NF-kB activation compared with wild-type c-Myb. Our data demonstrate that c-Myb pathway overactivation caused by unbalanced c-Myb-9A overexpression is associated with disorders in cellular homeostasis and consequently, accelerated transformation, cell proliferation, and malignancy in ATL cells."

According to the news editors, the research concluded: "These data support the notion of the c-Myb pathway as a promising new therapeutic target for ATL."

For more information on this research see: Dysregulation of c-Myb Pathway by Aberrant Expression of Proto-oncogene MYB Provides the Basis for Malignancy in Adult T-cell Leukemia/lymphoma Cells. Studies in the Area of Alzheimer Disease Reported from Yonsei University (Discovering New Genes in the Pathways of Common Sporadic Neurodegenerative Diseases: A Bioinformatics Approach)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Late onset Alzheimer's disease (AD) and Parkinson's disease (PD) are mostly 'sporadic' age-related neurodegenerative disorders, but with a clear genetic component. However, their genetic architecture is complex and heterogeneous, largely remaining a conundrum, with only a handful of well-established genetic risk factors consistently associated with these diseases."

Our news journalists obtained a quote from the research from Yonsei University, "It is possible that numerous, yet undiscovered, AD and PD related genes might exist. We focused on the 'gene' as a mediator to find new potential genes that might have a relationship with both disorders using bio-literature mining techniques. Based on Entrez Gene, we extracted the genes and directional gene-gene relation in the entire MEDLINE records and then constructed a directional gene-gene network. We identified common genes associated with two different but related diseases by performing shortest path analysis on the network. With our approach, we were able to identify and map already known genes that have a direct relationship with PD and AD. In addition, we identified 7 genes previously unknown to be a bridge between these two disorders. We confirmed 4 genes, ROS1, FMN1, ATP8A2, and SNORD12C, by biomedical literature and further checked 3 genes, ERVK-10, PRS, and C7orf49, that might have a high possibility to be related with both diseases. Additional experiments were performed to demonstrate the effectiveness of our proposed method."

According to the news editors, the research concluded: "Comparing to the co-occurrence approach, our approach detected 25% more candidate genes and verified 10% more genes that have the relationship between both diseases than the co-occurrence approach did."

The news correspondents report that additional information may be obtained from Y.H. Kim, Dept. of Library and Information Science, Yonsei University, 50 Yonsei-ro, Seodaemun-gu, Seoul, South Korea. Additional authors for this research include S.H. Beak, A. Charidimou and M. Song.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3233/JAD-150769. This DOI is a link to an online electronic document that is either free or for purchase.

Studies in the Area of Anions Reported from Harvard School of Medicine (Acute Phosphate Restriction Impairs Bone Formation and Increases Marrow Adipose Tissue in Growing Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Anions. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Phosphate plays a critical role in chondrocyte maturation and skeletal mineralization. Studies examining the consequences of dietary phosphate restriction in growing mice demonstrated not only the development of rickets, but also a dramatic decrease in bone accompanied by increased marrow adipose tissue (MAT)."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "Thus studies were undertaken to determine the effects of dietary phosphate restriction on bone formation and bone marrow stromal cell (BMSC) differentiation. Acute phosphate restriction of 28-day-old mice profoundly inhibited bone formation within 48 hours. It also resulted in increased mRNA expression of the early osteolineage markers Sox9 and Runx-related transcription factor 2 (Runx2), accompanied by decreased expression of the late osteolineage markers Osterix and Osteocalcin in BMSCs and osteoblasts, suggesting that phosphate restriction arrests osteoblast differentiation between Runx2 and Osterix. Increased expression of PPAR and CEBP, key regulators of adipogenic differentiation, was observed within 1 week of dietary phosphate restriction and was followed by a 13-fold increase in MAT at 3 weeks of phosphate restriction. In vitro phosphate restriction did not alter BMSC osteogenic or adipogenic colony formation, implicating aberrant paracrine or endocrine signaling in the in vivo phenotype. Because BMP signaling regulates the transition between Runx2 and Osterix, this pathway was interrogated. A dramatic decrease in pSmad1/5/9 immunoreactivity was observed in the osteoblasts of phosphate-restricted mice on day 31 (d31) and d35. This was accompanied by attenuated expression of the BMP target genes Id1, KLF10, and Foxc2, the latter of which promotes osteogenic and angiogenic differentiation while impairing adipogenesis. A decrease in expression of the Notch target gene Hey1, a BMP-regulated gene that governs angiogenesis, was also observed in phosphate-restricted mice, in association with decreased metaphyseal marrow vasculature."

According to the news editors, the research concluded: "Whereas circulating phosphate levels are known to control growth plate maturation and skeletal mineralization, these studies reveal novel consequences of phosphate restriction in the regulation of bone formation and osteoblast differentiation."

For more information on this research see: Acute Phosphate Restriction Impairs Bone Formation and Increases Marrow Adipose Tissue in Growing Mice. *Journal of Bone and Mineral Research*, 2016;31(12):2204-2214. *Journal of Bone and Mineral Research* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Membrane Proteins - Antimicrobial Cationic Peptides

Studies in the Area of Antimicrobial Cationic Peptides Reported from Wayne State University (Are there any ways around the exposure-limiting nephrotoxicity of the polymyxins?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Membrane Proteins - Antimicrobial Cationic Peptides. According to news reporting originating from Detroit, Michigan, by NewsRx correspondents, research stated, "The polymyxins (colistin and polymyxin B) have emerged over the past 20 years as essential antibacterial agents that often are the only remaining active class against troublesome multidrug-resistant Gram-negative bacilli such as carbapenem-resistant Acinetobacter baumannii, Pseudomonas aeruginosa and Enterobacteriaceae."

Financial support for this research came from National Institute of Allergy and Infectious Diseases.

Our news editors obtained a quote from the research from Wayne State University, "The utility of this class is limited by its dose-dependent nephrotoxicity, which can occur in more than one-half of patients receiving therapy with either agent. Strategies are urgently needed to optimise the use of this class of agents to ensure optimal activity while minimising the treatment-limiting nephrotoxicity."

According to the news editors, the research concluded: "This review will focus on risk factors for polymyxin-associated nephrotoxicity, potential strategies for limiting this exposure-dependent toxicity and, finally, unknowns and future research directions pertinent to this topic."

The news editors report that additional information may be obtained by contacting J.M. Pogue, Wayne State University, Sch Med, Detroit, MI, United States. Additional authors for this research include J.K. Ortwine and K.S. Kaye.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijantimicag.2016.11.001. This DOI is a link to an online electronic
Studies in the Area of Antirheumatics Reported from Michigan Technological University [Synthesis and Characterization of the Novel Nitric Oxide (NO) Donating Compound, S-nitroso-N-acetyl-D-penicillamine Derivatized Cyclam (SNAP-Cyclam)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antirheumatics. According to news originating from Houghton, Michigan, by NewsRx correspondents, research stated, "Nitric oxide (NO) has been heavily studied over the past two decades due to its multitude of physiological functions and its potential therapeutic promise. Of major interest is the desire to fabricate or coat implanted devices with an NO releasing material that will impart the appropriate dose and duration of NO release to positively mediate the biological response to the medical device, thereby improving its safety and efficacy."

Financial supporters for this research include National Heart, Lung, and Blood Institute, Division of Materials Research.

Our news journalists obtained a quote from the research from Michigan Technological University, "To date, this goal has not yet been achieved, despite very promising early research. Herein, we describe the synthesis and NO release properties of a novel NO donor which covalently links the S-nitrosothiol, S-nitroso-N-acetyl-D-penicillamine (SNAP), to the macrocycle, cyclam (SNAP-cyclam). This compound can then be blended into a wide variety of polymer matrices, imparting NO release to the polymer system. This release can be initiated and controlled by transition metal catalysis, thermal degradation or photolytic release of NO from the composite NO-releasing material."

According to the news editors, the research concluded: "SNAP-cyclam is capable of releasing physiologically relevant levels of NO for up to 3 months in vitro when blended into poly(l-lactic acid) thin films."

The news correspondents report that additional information may be obtained from C.W. McCarthy, Dept. of Biomedical Engineering, Michigan Technological University, Houghton, Michigan 49931, United States. Additional authors for this research include J. Goldman and M.C. Frost.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acsami.5b12548. This DOI is a link to an online electronic document.

**Biological Factors - Arthropod Venoms**

**Studies in the Area of Arthropod Venoms Reported from State University of Campinas (Age-Related Modulations of AQP4 and Caveolin-1 in the Hippocampus Predispose the Toxic Effect of Phoneutria nigriventer Spider Venom)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Biological Factors - Arthropod Venoms have been presented. According to news reporting originating from Campinas, Brazil, by NewsRx correspondents, research stated, "We have previously demonstrated that Phoneutria nigriventer venom (PNV) causes blood-brain barrier (BBB) breakdown, swelling of astrocytes end-feet and fluid permeation into brain interstitium in rats. Caveolae and water channels respond to BBB alterations by co-participation in shear stress response and edema formation/resolution."

Our news editors obtained a quote from the research from the State University of Campinas, "Herein, we showed post-natal developmental-related changes of two BBB-associated transporter proteins: the endothelial caveolin-1 (Cav-1), the major scaffolding protein from caveolae frame, and the astroglial aquaporin-4 (AQP4), the main water channel protein expressed in astrocytic peri-vascular end-feet processes, in the hippocampus of rats intraperitoneally-administered PNV. Western blotting protein levels; immunohistochemistry (IHC) protein distribution in CA1, CA2, and CA3 subfields; and gene expression by Real Time-Polymerase Chain Reaction (qPCR) were assessed in post-natal Day 14 (P14) and 8-10-week-old rats over critical periods of envenomation. The intensity and duration of the toxic manifestations indicate P14 neonate rats more vulnerable to PNV than adults. Histologically, the capillaries of P14 and 8-10-week-old rats treated with PNV showed perivascular edema, while controls did not. The intensity of the toxic manifestations in P14 decreases temporally (2 > 5 > 24 h), while inversely the expression of AQP4 and Cav-1 peaked at 24 h when clinically PNV-treated animals do not differ from saline controls. IHC of AQP4 revealed that hippocampal CA1 showed the least expression at 2 h when toxic manifestation was maximal. Subfield IHC quantification revealed that in P14 rats Cav-1 peaked at 24 h when toxic manifestations were absent, whereas in 8-10-week-old rats Cav-1 peaked at 2 h when toxic signs were highest, and progressively attenuated such increases until 24 h, remaining though significantly above baseline."

According to the news editors, the research concluded: "Considering astrocyte-endothelial physical and functional interactions, we hypothesize that age-related modulations of AQP4 and Cav-1 might be linked both to changes in functional properties of astrocytes during post-natal development and in the BBB breakdown induced by the venom of P. nigriventer."

For more information on this research see: Age-Related Modulations of AQP4 and Caveolin-1 in the Hippocampus Predispose the Toxic Effect of Phoneutria nigriventer Spider Venom. *International Journal of Molecular Sciences*, 2016;17(11):118-131. *International

Atorvastatin

Studies in the Area of Atorvastatin Reported from Istanbul University (Atorvastatin acutely reduces the reactivity to spasmogens in rat aorta: implication of the inhibition of geranylgeranylation and MYPT-1 phosphorylation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Atorvastatin. According to news reporting originating in Istanbul, Turkey, by NewsRx journalists, research stated, "Statins are known to display benefits in various diseases independently from their cholesterol lowering properties. In this study, we investigated the acute effects of atorvastatin on vascular reactivity to various spasmogens in isolated rat aorta."

Financial support for this research came from Research Fund of University of Istanbul.

The news reporters obtained a quote from the research from Istanbul University, "The responses to noradrenaline (NA, 10(-8) -10(-4) m), endothelin-1 (ET-1, 10(-10) -10(-7) m), and potassium chloride (KCl, 10-100 mm) were evaluated in aortic rings pretreated with atorvastatin (10(-7) -10(-4) m, 30 min). To verify the mechanism of action, the effects of atorvastatin were studied in the presence of cholesterol precursor, mevalonate (10(-2) m, 45 min), mevalonate-derived isoprenoids, namely geranylgeranyl pyrophosphate (GGPP, 5 ? 10(-6) m, 30 min) and farnesyl pyrophosphate (FPP, 5 ? 10(-6) m, 30 min), and in the absence of endothelium. In parallel, aortic rings were pretreated with the specific inhibitor of Rho kinase, Y-27632 (10(-7) -10(-6) m). Atorvastatin significantly and concentration-dependently reduced the contractions to spasmogens in rat aorta. This acute inhibitory effect was also evident in endothelium-denuded rings. Pretreatment with mevalonate and GGPP, but not with FPP, reversed the inhibitory effect of atorvastatin (10(-4) m) on NA and ET-1 induced contractions. Similar to atorvastatin, pretreatment with Y-27632 inhibited the contractions to NA and KCl in a concentration-dependent manner. Western blot analysis revealed that both atorvastatin (10(-4) m) and Y-27632 (10(-6) m) pretreatment inhibited the phosphorylation of myosin phosphatase target subunit-1 (MYPT-1) triggered by NA, indicating an inhibitory influence on myosin phosphatase."

According to the news reporters, the research concluded: "Atorvastatin displayed an
acute inhibitory effect on vascular contractility evoked by various spasmogens and the inhibitory effect was possibly mediated by the inhibition of mevalonate and GGPP synthesis as well as the prevention of MYPT-1 phosphorylation induced by Rho/Rho kinase."

Our news correspondents report that additional information may be obtained by contacting F.I. Alp Yildirim, Dept. of Pharmacology, Faculty of Pharmacy, Istanbul University, 34116, Beyazit, Istanbul, Turkey. Additional authors for this research include D. Kaleli Durman, E. Aypar, M. Ark, O. Ozdemir and B.S Uydes Dogan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/fcp.12173. This DOI is a link to an online electronic document that is either free or for purchase.

**Heart Disorders and Diseases - Atrial Fibrillation**

**Studies in the Area of Atrial Fibrillation Reported from Department of Biophysics (Treatment Planning Studies in Patient Data With Scanned Carbon Ion Beams for Catheter-Free Ablation of Atrial Fibrillation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Atrial Fibrillation are discussed in a new report. According to news originating from Darmstadt, Germany, by NewsRx correspondents, research stated, "Catheter ablation with isolation of the pulmonary veins is a common treatment option for atrial fibrillation but still has insufficient success rates and carries several interventional risks. These treatment planning studies assessed if high-dose single fraction treatment with scanned carbon ions (12C) can be reliably delivered for AF ablation, while sparing risk structures and considering respiratory and contractile target motion."

Our news journalists obtained a quote from the research from the Department of Biophysics, "Time resolved CT scans of complete respiratory and cardiac cycles of 9 and 5 patients, respectively, were obtained. Ablation lesions and organs at risk for beam delivery were contoured. Single fraction intensity-modulated particle therapy with target doses of 25 and 40 Gy were studied and motion influences on these deliveries mitigated. Respiration had a large influence on lesion displacement (<= 2 cm). End expiration could be exploited as a stable gating window. Smaller, but less predictable, heartbeat displacements (<6 mm) remained to be mitigated because cardiac contraction resulted in insufficient dose coverage (V95 <90%) if uncompensated. Repeated irradiation (12C beam rescanning) during breath hold was used to accommodate contractile motion, resulting in good dose coverage. Dose depositions to all organs at risk were carefully examined and did not exceed values for X-ray cancer treatment."

According to the news editors, the research concluded: "Treatment planning of 12C with delivery of physical ionizing radiation doses that have been described to induce complete
block is feasible for AF ablation, considering human anatomy, dose constraints, and encasing underlying motion patterns from respiration and cardiac contraction at the LA-PV junction into treatment planning."

The news correspondents report that additional information may be obtained from A. Constantinescu, Dept. of Biophysics, GSI Helmholtzzentrum fur Schwerionenforschung, Darmstadt, Germany. Additional authors for this research include H.I. Lehmann, D.L. Packer, C. Bert, M. Durante and C. Graeff.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jce.12888. This DOI is a link to an online electronic document that is either free or for purchase.

**Heart Disorders and Diseases - Atrial Fibrillation**

**Studies in the Area of Atrial Fibrillation Reported from Kumamoto University (Prevalence and mechanism of rotor activation identified during atrial fibrillation by noncontact mapping: Lack of evidence for a role in the maintenance of atrial ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Atrial Fibrillation. According to news originating from Kumamoto, Japan, by NewsRx correspondents, research stated, "It remains unclear whether atrial fibrillation (AF) is maintained by the rotor. We evaluated the role of the rotor and examined its mechanism."

Our news journalists obtained a quote from the research from Kumamoto University, "Among 75 patients with AF (60 paroxysmal, 15 persistent AF) who underwent 3-dimensional noncontact left atrial mapping during AF, we examined the prevalence and location of rotor activation and elucidated its mechanism. Catheter ablation was performed in a stepwise fashion (linear roof lesion and complex fractionated atrial electrogram ablation after pulmonary vein (PV) isolation) until AF termination. Rotor activation was observed in 11 patients (14.7 /0; 10 paroxysmal and 1 persistent AF) (tachycardia cycle length 160.0 +/- 19.8 ms). Rotor were observed transiently (duration 6128 +/- 9094 ms) during AF at the roof (n = 5), septum (n = 3), and ostium of the left superior PV (n = 3). Five rotors circulated in clockwise and 6 in counterclockwise directions. The length of the block line at the center of the rotor was 15.2 +/- 6.9 mm. The electrograms at the block line showed low-amplitude multiple deflections (n = 7) or double potentials (n = 4), and the amplitudes during rotor activation were significantly lower
than those during sinus rhythm (0.27 +/- 0.18 mV vs 1.22 +/- 0.92 mV; P< .01). No conduction disturbances were found during sinus rhythm, suggesting that the central line of block was formed functionally. AF was terminated by PV isolation alone without additional lesions in patients with rotors. Functionally formed rotor activation was observed during AF in a limited number of patients."

According to the news editors, the research concluded: "These rotor activations may not be related to AF maintenance, but rather may reflect a transient organization of random propagation."

The news correspondents report that additional information may be obtained from H. Yamabe, Kumamoto University, Grad Sch Med Sci, Dept. of Cardiovasc Med, Kumamoto 8608556, Japan. Additional authors for this research include H. Kanazawa, M. Ito, S. Kaneko and H. Ogawa.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.hrthm.2016.07.030. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Kumamoto, Japan, Asia, Heart Disorders and Diseases, Atrial Fibrillation, Cardiac Arrhythmias, Heart Disease, Kumamoto University.

Heart Disorders and Diseases - Atrial Fibrillation

Studies in the Area of Atrial Fibrillation Reported from Virginia Commonwealth University (Factors Influencing Diaphragmatic Compound Motor Action Potentials During Cryoballoon Ablation for Atrial Fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Atrial Fibrillation. According to news originating from Richmond, Virginia, by NewsRx correspondents, research stated, "Factors Influencing Diaphragmatic CMAP. The diaphragmatic compound motor action potentials (CMAPs) have been used to predict and prevent phrenic nerve injury (PNI) during cryoballoon ablation of right pulmonary veins."

Our news journalists obtained a quote from the research from Virginia Commonwealth University, "We sought to assess factors that influence the amplitude of the surface CMAP recordings. We analyzed CMAPs from consecutive patients undergoing cryoballoon ablation for paroxysmal atrial fibrillation. CMAP recordings were obtained using electrocardiography electrodes positioned in the 'modified lead I' method while stimulating the right PN, until loss of capture (ascertained by palpation and fluoroscopy of the right hemidiaphragm). A total of 55 patients (age 63 +/- 11 years; 60% men; body mass index [BMI] 31 +/- 6) had adequate CMAP recordings and were included for evaluation of CMAP signals."
CMap demonstrated 2 distinct components, an early higher amplitude signal (pacing artifact) and a later lower amplitude signal (true diaphragmatic CMap). There was no significant change in the true CMap recording amplitude with decrease in stimulus strength (P = 0.1). There was no impact of BMI on CMap amplitude (P = 0.93). There was a significant phasic respiratory variation in CMap amplitude with a mean decrease in CMap amplitude of 10.8% (range: 8-12%) with inspiration lasting an average of 2 beats (P < 0.001). A decrease in CMap amplitude of >30% was noted in 6 cases (11%) and termination of cryoablation prevented PNI. Diaphragmatic CMap amplitude is not affected by stimulus strength or BMI. There is a significant respirophasic decrease in CMap signal amplitude with inspiration.

According to the news editors, the research concluded: "It is important to be aware of this variation to avoid premature termination of cryoablation."

The news correspondents report that additional information may be obtained from P.S. Sharma, Virginia Commonwealth University, Medical Center, Div Cardiol, Richmond, VA, United States. Additional authors for this research include S.K. Padala, J.J. Thompson, S. Gunda, J.N. Koneru and K.A. Ellenbogen.

Keywords for this news article include: Richmond, Virginia, United States, North and Central America, Heart Disorders and Diseases, Atrial Fibrillation, Cardiac Arrhythmias, Heart Disease, Virginia Commonwealth University.

Our news journalists obtained a quote from the research from the University of Sao Paulo, "Our objective was to identify how the ABI can be applied to primary care. Three different methods of calculating the ABI were compared among 13,921 men and women aged 35 to 74 years who were free of cardiovascular diseases and enrolled in the Brazilian Longitudinal Study of Adult Health (ELSA-Brasil). The ABI ratio had the same denominator for the three categories created (the highest value for arm systolic blood pressure), and the numerator was based on the four readings for leg systolic blood pressure: the highest (ABI-
HIGH), the mean (ABI-MEAN), and the lowest (ABI-LOW). The cut-off for analysis was ABI <1.0%. All determinations of blood pressure were done with an oscillometric device. The prevalence of ABI <1% was 0.5, 0.9, and 2.7 for the categories HIGH, MEAN and LOW, respectively. All methods were associated with a high burden of cardiovascular risk factors. The association with IMT was stronger for ABI-HIGH than for the other categories. The proportion of participants with a 10-year Framingham Risk Score of coronary heart disease >20% without the inclusion of ABI <1.0 was 4.9%. For ABI-HIGH, ABI-MEAN and ABI-LOW, the increase in percentage points was 0.3, 0.7, and 2.3%, respectively, and the relative increment was 6.1, 14.3, and 46.9%.

According to the news editors, the research concluded: "All methods were acceptable, but ABI-LOW was more suitable for prevention purposes."

For more information on this research see: Different methods of calculating ankle-brachial index in mid-elderly men and women: the Brazilian Longitudinal Study of Adult Health (ELSA-Brasil). *Brazilian Journal of Medical and Biological Research*, 2016;49(12):12-18.

**Studies in the Area of Blood Transfusion Reported from University of Tel Aviv (How Long Is Safe? Setting the Cutoff for Uncomplicated Third Stage Length: A Retrospective Case-Control Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Transfusion Medicine - Blood Transfusion. According to news reporting originating from Tel Aviv, Israel, by NewsRx correspondents, research stated, "The aim of our study was to determine the optimal time for manual placental removal in an uncomplicated third stage while taking into consideration the risk for blood transfusion. Risk factors for postpartum blood transfusions were studied."

Our news editors obtained a quote from the research from the University of Tel Aviv, "Computerized data of all vaginal deliveries at our labor and delivery unit from 2010 to 2014 were obtained. Cases of complete and spontaneous placental separation up to 60 minutes into the third stage of labor were extracted for analysis. Patient demographics, obstetrical history, delivery course, and outcome were assessed as well as blood product requirements during the postpartum period. Receiver-operating curves (ROC) for prediction of blood transfusion during the third stage were calculated and risk factors were assessed. 31,226 vaginal deliveries occurred during the study period and 28,586 deliveries culminated with complete and spontaneous placental separation, 25,160 of which met inclusion criteria. Independent risk factors for blood transfusions were primiparity, longer second and third stage length, labor
induction, and maternal intrapartum fever. ROC curves showed that the optimal cutoff for the prediction of blood transfusions was 17 minutes into the third stage of labor. Waiting more than 30 minutes for placental separation increases the risk for blood transfusion more than threefold. A third stage longer than 17 minutes is associated with an increased risk for blood transfusion postpartum."

According to the news editors, the research concluded: "After more than 30 minutes, the risk for blood transfusions increases more than threefold."

The news editors report that additional information may be obtained by contacting S. Shinar, Dept. of Obstetrics and Gynecology, Lis Maternity Hospital Sourasky, Medical Center, Sackler School of Medicine, University of Tel Aviv, Tel Aviv, Israel. Additional authors for this research include A. Schwartz, S. Maslovitz and A. Many.

Oncology - Breast Cancer

Studies in the Area of Breast Cancer Reported from Institute of Clinical Oncology (The phenomenon of acquired resistance to metformin in breast cancer cells: The interaction of growth pathways and estrogen receptor signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Breast Cancer have been presented. According to news reporting originating from Moscow, Russia, by NewsRx correspondents, research stated, "Metformin, a biguanide antidiabetic drug, is used to decrease hyperglycemia in patients with type 2 diabetes. Recently, the epidemiological studies revealed the potential of metformin as an anti-tumor drug for several types of cancer, including breast cancer."

Financial supporters for this research include Russian Science Foundation, Russian Foundation for Basic Research.

Our news editors obtained a quote from the research from the Institute of Clinical Oncology, "Anti-tumor metformin action was found to be mediated, at least in part, via activation of adenosine monophosphate-activated protein kinase (AMPK)-intracellular energy sensor, which inhibits the mammalian target of rapamycin (mTOR) and some other signaling pathways. Nevertheless, some patients can be non-sensitive or resistant to metformin action. Here we analyzed the mechanism of the formation of metformin-resistant phenotype in breast cancer cells and its role in estrogen receptor (ER) regulation. The experiments were performed on the ER-positive MCF-7 breast cancer cells and metformin-resistant MCF-7 subline (MCF-7/M) developed due to long-term metformin treatment. The transcriptional activity of NF-kB
and ER was measured by the luciferase reporter gene analysis. The protein expression was determined by immunoblotting (Snail1, (phospho)AMPK, (phospho)IkBa, (phospho)mTOR, cyclin D1, (phospho)Akt and ERα) and immunohistochemical analysis (E-cadherin). We have found that: 1) metformin treatment of MCF-7 cells is accompanied with the stimulation of AMPK and inhibition of growth-related proteins including IkBa, NF-κB, cyclin D1 and ERα; 2) long-term metformin treatment lead to the appearance and progression of cross-resistance to metformin and tamoxifen; the resistant cells are characterized with the unaffected AMPK activity, but the irreversible ER suppression and constitutive activation of Akt/Snail1 signaling; 3) Akt/Snail1 signaling is involved into progression of metformin resistance. The results presented may be considered as the first evidence of the progression of cross-resistance to metformin and tamoxifen in breast cancer cells."

According to the news editors, the research concluded: "Importantly, the acquired resistance to both drugs is based on the constitutive activation of Akt/Snail1/E-cadherin signaling that opens new perspectives to overcome the metformin/tamoxifen resistance of breast cancer."

The news editors report that additional information may be obtained by contacting A.M. Scherbakov, Laboratory of Clinical Biochemistry, Institute of Clinical Oncology, NN Blokhin Cancer Research Centre, Moscow, Russia. Additional authors for this research include D.V. Sorokin, V.V. Tatarskiy, N.S. Prokhorov, S.E. Semina, L.M. Berstein and M.A Krasil’nikov.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/iub.1481. This DOI is a link to an online electronic document that is either free or for purchase.

Biotechnology - Cancer Gene Therapy

Studies in the Area of Cancer Gene Therapy Reported from University of Nice Sophia-Antipolis (Pathologists and liquid biopsies: to be or not to be?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Biotechnology - Cancer Gene Therapy. According to news originating from Nice, France, by NewsRx correspondents, research stated, "Recently, the advent of therapies targeting genomic alterations has improved the care of patients with certain types of cancer. While molecular targets were initially detected in nucleic acid samples extracted from tumor tissue, detection of nucleic acids in circulating blood has
allowed the development of what has become known as liquid biopsies, which provide a complementary and alternative sample source allowing identification of genomic alterations that might be addressed by targeted therapy."

Our news journalists obtained a quote from the research from the University of Nice Sophia-Antipolis, "Consequently, liquid biopsies might rapidly revolutionize oncology practice in allowing administration of more effective treatments. Liquid biopsies also provide an approach towards short-term monitoring of metastatic cancer patients to evaluate efficacy of treatment and/or early detection of secondary mutations responsible for resistance to treatment. In this context, pathologists, who have already been required in recent years to take interest in the domain of molecular pathology of cancer, now face new challenges. The attitude of pathologists to and level of involvement in the practice of liquid biopsies, including mastering the methods employed in molecular analysis of blood samples, need close attention. Regardless of the level of involvement of pathologists in this new field, it is mandatory that oncologists, biologists, geneticists, and pathologists work together to coordinate the pre-analytical, analytical, and post-analytical phases of molecular assessment of tissue and liquid samples of individual cancer patients. The challenges include (1) implementation of effective and efficient procedures for reception and analysis of liquid and tissue samples for histopathological and molecular evaluation and (2) assuring short turn-around times to facilitate rapid optimization of individual patient treatment."

According to the news editors, the research concluded: "In this paper, we will review the following: (1) recent data concerning the concept of liquid biopsies in oncology and its development for patient care, (2) advantages and limitations of molecular analyses performed on blood samples compared to those performed on tissue samples, and (3) short-term challenges facing pathologists in dealing with liquid biopsies of cancer patients and new strategies to early detect metastatic tumor cell clones."

For more information on this research see: Pathologists and liquid biopsies: to be or not to be? *Virchows Archiv*, 2016;469(6):601-609. *Virchows Archiv* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Virchows Archiv - www.springerlink.com/content/0945-6317/)

The news correspondents report that additional information may be obtained from P. Hofman, Univ Nice Sophia Antipolis, Univ Hosp Federat OncoAge, Nice, France.

**Oncology - Cancer Prevention**

**Studies in the Area of Cancer Prevention Reported from University of Massachusetts (Health literacy-listening skill and patient questions following cancer prevention and screening discussions)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
Wellness Week -- New research on Oncology - Cancer Prevention is the subject of a report. According to news reporting from Worcester, Massachusetts, by NewsRx journalists, research stated, "Patient question-asking is essential to shared decision making. We sought to describe patients' questions when faced with cancer prevention and screening decisions, and to explore differences in question-asking as a function of health literacy with respect to spoken information (health literacy-listening)."

Financial supporters for this research include National Cancer Institute, Cancer Research Resources & Collaboration in Integrated Health Care Systems, National Center for Advancing Translational Sciences.

The news correspondents obtained a quote from the research from the University of Massachusetts, "Four-hundred and thirty-three (433) adults listened to simulated physician-patient interactions discussing (i) prophylactic tamoxifen for breast cancer prevention, (ii) PSA testing for prostate cancer and (iii) colorectal cancer screening, and identified questions they would have. Health literacy-listening was assessed using the Cancer Message Literacy Test-Listenting (CMLT-Listening). Two authors developed a coding scheme, which was applied to all questions. Analyses examined whether participants scoring above or below the median on the CMLT-Listening asked a similar variety of questions. Questions were coded into six major function categories: risks/benefits, procedure details, personalizing information, additional information, decision making and credibility. Participants who scored higher on the CMLT-Listening asked a greater variety of risks/benefits questions; those who scored lower asked a greater variety of questions seeking to personalize information. This difference persisted after adjusting for education. Patients' health literacy-listening is associated with distinctive patterns of question utilization following cancer screening and prevention counselling."

According to the news reporters, the research concluded: "Providers should not only be responsive to the question functions the patient favours, but also seek to ensure that the patient is exposed to the full range of information needed for shared decision making."

Our news journalists report that additional information may be obtained by contacting K.M. Mazor, University of Massachusetts, Sch Med, Dept. of Med, Worcester, MA 01605, United States. Additional authors for this research include D.L. Rubin, D.W. Roblin, A.E. Williams, P.K.J. Han, B. Gaglio, S.L. Cutrona, M.E. Costanza and J.L. Wagner.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/hex.12387. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Worcester, Massachusetts, United States, North and Central America, Risk and Prevention, Diagnostics and Screening, Cancer Prevention, Oncology, University of Massachusetts.

Studies in the Area of Cardiovascular Agents Reported from University of Bern [Antiarrhythmic Action of Flecainide in Polymorphic Ventricular Arrhythmias Caused by a Gain-of-Function Mutation in the Na(v)1.5 Sodium Channel]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Cardiovascular Agents are presented in a new report. According to news reporting out of Bern, Switzerland, by NewsRx editors, research stated, "The cardiac sodium channel Na(v)1.5, encoded by the gene SCN5A, is associated with a wide spectrum of hereditary arrhythmias. The gain-of-function mutation p.I141V in SCN5A was identified in a large multigenerational family with exercise-induced polymorphic ventricular arrhythmias."

Our news journalists obtained a quote from the research from the University of Bern, "The purpose of this study was to evaluate the molecular and clinical effects of flecainide administration on patients with this syndrome. Eleven p.I141V carriers who exhibited frequent multiformic premature ventricular complexes (PVCs) during exercise were subjected to exercise stress tests, both before and after intravenous infusion of 2 mg/kg flecainide. The in vitro effects of flecainide were evaluated using the patch-clamp technique with HEK293 cells expressing the Na(v)1.5 channel. The flecainide treatment significantly reduced the frequency of PVCs during and after exercise. Next, the sensitivity of the p.I141V mutant channel to flecainide was compared to that of the wild type channel. Perfusion of flecainide inhibited the peak and window currents in both groups. The clinical investigations of the affected patients, as well as the molecular and pharmacological characterization of the SCN5A p.I141V mutation, provide new evidence supporting the association of this mutation with exercise-induced polymorphic ventricular arrhythmias."

According to the news editors, the research concluded: "These data also demonstrate that flecainide may serve as an effective treatment for the defect in Na(v)1.5 that leads to an increased sodium window current."

Our news journalists report that additional information may be obtained by contacting M.Y. Amarouch, University of Bern, Dept. of Clin Res, CH-3010 Bern, Switzerland. Additional authors for this research include H. Swan, J. Leinonen, A. Marjamaa, A.M. Lahtinen, K. Kontula, L. Toivonen, E. Widen and H. Abriel.

Keywords for this news article include: Bern, Switzerland, Europe, Antiarrhythmic Agents, Cardiovascular Agents, Drugs and Therapies, Flecainide Therapy, Membrane Proteins, Carrier Proteins, Sodium Channels, Ion Channels, Arrhythmia, Cardiology, Genetics, University of Bern.

Cardiovascular Diseases

Studies in the Area of Cardiovascular Diseases Reported from University of Western Ontario [Emerging Therapeutic Options for Lowering of Lipoprotein(a): Implications for Prevention of Cardiovascular Disease]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases. According to news reporting from London, Canada, by NewsRx editors, the research stated, "Purpose of Review Elevated plasma concentrations of lipoprotein(a) (Lp(a)) are an independent and causal risk factor for cardiovascular diseases including coronary artery disease, ischemic stroke, and calcific aortic valve stenosis. This review summarizes the rationale for Lp(a) lowering and surveys relevant clinical trial data using a variety of agents capable of lowering Lp(a)."

The news correspondents obtained a quote from the research from the University of Western Ontario, "Contemporary guidelines and recommendations outline populations of patients who should be screened for elevated Lp(a) and who might benefit from Lp(a) lowering. Therapies including drugs and apheresis have been described that lower Lp(a) levels modestly (similar to 20 %) to dramatically (similar to 80 %). Existing therapies that lower Lp(a) also have beneficial effects on other aspects of the lipid profile, with the exception of Lp(a)-specific apheresis and an antisense oligonucleotide that targets the mRNA encoding apolipoprotein(a). No clinical trials conducted to date have managed to answer the key question of whether Lp(a) lowering confers a benefit in terms of ameliorating cardiovascular risk, although additional outcome trials of therapies that lower Lp(a) are ongoing."

According to the news reporters, the research concluded: "It is more likely, however, that Lp(a)-specific agents will provide the most appropriate approach for addressing this question."

For more information on this research see: Emerging Therapeutic Options for Lowering of Lipoprotein(a): Implications for Prevention of Cardiovascular Disease. Current Atherosclerosis Reports, 2016;18(12):6-16. Current Atherosclerosis Reports can be contacted at: Current Medicine Group, 400 Market Street, Ste 700, Philadelphia, PA 19106, USA. Studies in the Area of Cardiovascular Physiological Processes Reported from Emory University (Catheter-measured Hemodynamics of Adult Fontan Circulation: Associations with Adverse Event and End-organ Dysfunctions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Physiological Processes have been published. According to news reporting from Atlanta, Georgia, by NewsRx journalists, research stated. "In heart failure, a high systemic vascular resistance index (SVRI), high central venous pressure (CVP), and low cardiac index (CI) predict poor outcomes. Conversely, late hemodynamic manifestations of failing Fontan circulation and associations with end-organ dysfunction are not well understood."

The news correspondents obtained a quote from the research from Emory University, "A retrospective review of right-heart catheterization data of adult Fontan patients between 2002 and 2014 was conducted. Relationships between hemodynamic variables and serious adverse events (death or heart transplant) were examined using the Cox proportional hazard analysis. Correlations between the hemodynamic measurements and signs of end-organ dysfunction (MELD-XI, Child-Pugh, VAST score, estimated glomerular filtration rate [eGFR]) were analyzed. Sixty post-Fontan patients (85% systemic left ventricle, 40% atrio pulmonary Fontan, mean age of 28 years, and mean time since Fontan operation of 21.9 years) were included. At baseline, those with an event were statistically younger, had lower transcutaneous oxygen saturations, were more likely to have an atrio pulmonary Fontan, and were more likely to have a pacemaker. Eighteen experienced a cardiovascularly significant event. Using univariate analysis to compare the event and nonevent groups, mean CI was 2.8 +/- 0.9 vs. 2.4 +/- 0.5 L/min/m(2) (P = .004), and CVP was 18.6 +/- 6.5 vs. 16.1 +/- 4.3 mmHg (P = .03). However, the statistical significances did not persist in the multivariate model. Higher CVP and pulmonary capillary wedge pressure (PCWP) were associated with higher MELD-XI and Child-Pugh scores, and the VAST score was only associated with PCWP. Symptomatic adult Fontan patients who experienced an event manifested with a higher CI and CVP, although the multivariate Cox proportional hazard analysis did not yield any significant associations. The presences of hepatic dysfunction and portal venous outflow obstruction were associated with a higher CVP and PCWP."

According to the news reporters, the research concluded: "Renal dysfunction was prevalent but no statistically significant association between the hemodynamic measurements was identified, although trends toward a higher CVP and transpulmonary gradient were identified."

For more information on this research see: Catheter-measured Hemodynamics of Adult Fontan Circulation: Associations with Adverse Event and End-organ Dysfunctions. Congenital Heart Disease, 2016;11(6):589-597. Congenital Heart Disease can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Life Science Research - Cell Biology

Studies in the Area of Cell Biology Reported from Baylor University College of Medicine (Circadian Homeostasis of Liver Metabolism Suppresses Hepatocarcinogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Life Science Research - Cell Biology have been presented. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "Chronic jet lag induces spontaneous hepatocellular carcinoma (HCC) in wild-type mice following a mechanism very similar to that observed in obese humans. The process initiates with non-alcoholic fatty liver disease (NAFLD) that progresses to steatohepatitis and fibrosis before HCC detection."

Financial supporters for this research include NIH, USDA, CRPIT, Welch, Public Health Service Grant, NCI, Dan L. Duncan Cancer Center, NSF, Alkek Center, BCM Agilent Technologies Center of Excellence.

Our news editors obtained a quote from the research from the Baylor University College of Medicine, "This pathophysiological pathway is driven by jet-lag-induced genome-wide gene deregulation and global liver metabolic dysfunction, with nuclear receptor-controlled cholesterol/bile acid and xenobiotic metabolism among the top deregulated pathways. Ablation of farnesoid X receptor dramatically increases enterohepatic bile acid levels and jet-lag induced HCC, while loss of constitutive androstane receptor (CAR), a well-known liver tumor promoter that mediates toxic bile acid signaling, inhibits NAFLD-induced hepatocarcinogenesis."

According to the news editors, the research concluded: "Circadian disruption activates CAR by promoting cholestasis, peripheral clock disruption, and sympathetic dysfunction."

For more information on this research see: Circadian Homeostasis of Liver Metabolism Suppresses Hepatocarcinogenesis. Cancer Cell, 2016;30(6):909-924. Cancer Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cancer Cell - www.journals.elsevier.com/cancer-cell/)

The news editors report that additional information may be obtained by contacting D.D. Moore, Baylor College of Medicine, Dan L Duncan Canc Center, Houston, TX 77030, United States. Additional authors for this research include H. Voicu, M.J. Finegold, C. Coarfa, A. Sreekumar, N. Putluri, C.A. Katchy, C. Lee, D.D. Moore and L. Fu.

Life Science Research - Cell Biology

Studies in the Area of Cell Biology Reported from Charles University
(Shikonin regulates C-MYC and GLUT1 expression through the MST1-YAP1-TEAD1 axis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Life Science Research - Cell Biology is the subject of a report. According to news reporting from Prague, Czech Republic, by NewsRx journalists, research stated, "The general mechanism underlying the tumor suppressor activity of the Hippo signaling pathway remains unclear. In this study, we explore the molecular mechanisms connecting the Hippo signaling pathway with glucose metabolism."

Financial supporters for this research include Neuron Foundation and the Grant Agency of the Czech Republic projects, Charles University, Ministry of Education, Youth and Sports of CR, Project "BIOCEV", Institutional Research Concept.

The news correspondents obtained a quote from the research from Charles University, "We have found that two key regulators of glycolysis, C-MYC and GLUT1, are targets of the Hippo signaling pathway in human leukemia cells. Our results revealed that activation of MST1 by the natural compound shikonin inhibited the expression of GLUT1 and C-MYC. Furthermore, RNAi experiments confirmed the regulation of GLUT1 and C-MYC expression via the MST1-YAP1-TEAD1 axis. Surprisingly, YAP1 was found to positively regulate C-MYC mRNA levels in complex with TEAD1, while it negatively regulates C-MYC levels in cooperation with MST1. Hence, YAP1 serves as a rheostat for C-MYC, which is regulated by MST1. In addition, depletion of MST1 stimulates lactate production, whereas the specific depletion of TEAD1 has an opposite effect. The inhibition of lactate production and cellular proliferation induced by shikonin also depends on the Hippo pathway activity. Finally, a bioinformatic analysis revealed conserved TEAD-binding motifs in the C-MYC and GLUT1 promoters providing another molecular data supporting our observations."

According to the news reporters, the research concluded: "In summary, regulation of glucose metabolism could serve as a new tumor suppressor mechanism orchestrated by the Hippo signaling pathway."

For more information on this research see: Shikonin regulates C-MYC and GLUT1 expression through the MST1-YAP1-TEAD1 axis. Experimental Cell Research, 2016;349 (2):273-281. Experimental Cell Research can be contacted at: Elsevier Inc, 525 B Street, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Experimental Cell Research - www.journals.elsevier.com/experimental-cell-research/)

Nervous System Diseases and Conditions - Charcot-Marie-Tooth Disease

Studies in the Area of Charcot-Marie-Tooth Disease Reported from Faculty of Medicine (Histopathological features of a patient with Charcot-Marie-Tooth disease type 2U/AD-CMTax-MARS)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nervous System Diseases and Conditions - Charcot-Marie-Tooth Disease. According to news reporting originating in Osakasayama, Japan, by NewsRx journalists, research stated, "Charcot-Marie-Tooth (CMT) disease is a complex of peripheral nervous system disorders. CMT type 2U (CMT2U) is an autosomal dominant (AD) disease caused by mutations in the MARS gene encoding methionyl-tRNA synthetase; this disease has thus been newly called AD-CMTax-MARS."

The news reporters obtained a quote from the research from the Faculty of Medicine, "A few families with mutations in the MARS gene have been reported, without detailed histopathological findings. We describe a 70-year-old woman who had bilateral dysesthesia of the soles since the age of 66 years. Sural nerve biopsy showed a decrease in the density of large myelinated nerve fibers. Increased clusters of regenerating myelinated nerve fibers were noted. Electronmicroscopic analyses revealed degeneration of unmyelinated nerves. There was no vasculitis or inflammatory cell infiltration. Genetic analysis identified a heterozygous p.P800T mutation, a reported mutation in the MARS gene. We report the detailed histopathological findings in a patient with CMT2U/AD-CMTax-MARS."

According to the news reporters, the research concluded: "The findings are similar to those found in CMT2D caused by mutations in the GARS gene, encoding glycyl-tRNA synthetase."

Our news correspondents report that additional information may be obtained by contacting M. Hirano, Kindai Univ, Fac Med, Dept. of Neurol, Osakasayama, Japan. Additional authors for this research include N. Oka, A. Hashiguchi, S. Ueno, H. Sakamoto, H. Takashima, Y. Higuchi, S. Kusunoki and Y. Nakamura.

Studies in the Area of Clinical Pharmacology Reported from Maastricht University Hospital (A comparison of the intrasubject variation in drug exposure between generic and brand-name drugs: a retrospective analysis of replicate design trials)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Clinical Pharmacology are presented in a new report. According to news reporting from Maastricht, Netherlands, by NewsRx journalists, research stated, "The aim of the present study was to investigate whether differences in total and peak drug exposure upon generic substitution are due to differences between formulations or to intrasubject pharmacokinetic variability of the active substance. The study was designed as a retrospective reanalysis of existing studies."

The news correspondents obtained a quote from the research from Maastricht University Hospital, "Nine replicate design bioequivalence studies representing six drug classes -i.e. for alendronate, atorvastatin, cyclosporin, ebastine, exemestane, mycophenolate mofetil, and ropinirole -were retrieved from the Dutch Medicines Regulatory Authority. In most studies, the intrasubject variability in total and peak drug exposure was comparable for the brand-name [in the range 0.01-0.24 for area under the concentration-time curve (AUCt) and 0.02-0.29 for peak plasma concentration (Cmax) on a log scale] and generic (0.01-0.23 for AUCt and 0.08-0.33 for Cmax) drugs, and was comparable with the intrasubject variability upon switching between those drugs (0.01-0.23 for AUCt and 0.06-0.33 for Cmax). The variance related to subject-by-formulation interaction could be considered negligible (-0.069 to 0.047 for AUCt and -0.091 to 0.02 for Cmax). In the investigated studies, the variation in total and peak exposure seen when a patient is switched from a brand-name to a generic drug is comparable with that seen following repeated administration of the brand-name drug in the patient. Only the intrasubject variability seems to play a crucial and decisive role in the variation in drug exposure seen; no additional formulation-dependent variation in exposure is observed upon switching."

According to the news reporters, the research concluded: "Thus, our data support that, for the medicines that were included in the present investigation, from a clinical pharmacological perspective, the benefit-risk balance of a generic drug is comparable with that of the brand-name drug."

Our news journalists report that additional information may be obtained by contacting Y. Yu, Dept. of Pharmacology and Toxicology, CARIM, Maastricht University Medical Centre, Maastricht, Netherlands. Additional authors for this research include S. Teerenstra, C. Neef, D. Burger and M. Maliepaard.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/bcp.12828. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Europe, Maastricht, Netherlands, Drugs and Therapies, Clinical Pharmacology.
Clinical Research - Clinical Trials and Studies

Studies in the Area of Clinical Trials and Studies Reported from University of Bordeaux (Targeted therapy and elderly people: A review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Clinical Research - Clinical Trials and Studies have been presented. According to news originating from Bordeaux, France, by NewsRx correspondents, research stated, "The use of targeted therapy (TT) has radically changed the outcome of various cancers and introduces the era of personalised medicine. Elderly patients (>= 65 years) represent the majority of cancer diagnoses and deaths by age group with an increase expected over the next decade."

Our news journalists obtained a quote from the research from the University of Bordeaux, "This group of patients is heterogeneous with three categories of patients: fit, vulnerable and frail, with specific treatment for each subgroup. In this review, we assess safety and efficacy of TT in elderly patients, principally from data of pivotal clinical trials with subgroup analysis, but elderly people represented a small percentage of the total number of patients. Few specific trials have been carried out for TT in elderly people with most patients considered to be fit. However, tolerance and efficacy of TT in elderly patients seems similar to that for younger patients, with an increase in incidence of specific adverse events in elderly patients for selected TTs."

According to the news editors, the research concluded: "An adapted geriatric selection and strict monitoring could help to decrease toxicity, and specific clinical trials for elderly cancer patients would be useful."

The news correspondents report that additional information may be obtained from A. Daste, Univ Bordeaux, Bordeaux, France. Additional authors for this research include C. Chakiba, C. Domblides, M. Gross-goupil, A. Quivy, A. Ravaud and P. Soubeyran.

Studies in the Area of Colon Cancer Reported from Fujian Medical University (Correlational research of Golgi phosphorylation protein 3 expression in colorectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Colon Cancer are presented in a new report. According to news reporting from Quanzhou, People's Republic of China, by NewsRx journalists, research stated, "To investigate the effect of Golgi phosphorylation protein 3 (GOLPH3) expression on cell apoptosis, angiogenesis and prognosis in colorectal cancer (CRC). The expression of GOLPH3 in CRC tissues and normal colorectal mucosae was determined by immunohistochemistry in 62 patients."

The news correspondents obtained a quote from the research from Fujian Medical University, "In addition, immunohistochemistry was also carried out to detect the expression of vascular endothelial growth factor (VEGF), CD34 and microvessel density (MVD). Terminal deoxynucleotidyl transferase-mediated dUTP-biotin nick end labeling assay was used to determine the apoptotic index (AI). The Kaplan-Meier method was used to analyze the relationship between GOLPH3 expression and survival in another 123 CRC cases. Compared with normal colorectal mucosae, a notably higher level of GOLPH3 protein expression was identified in CRC tissues (53.2% vs 24.2%, p<0.05). Positive GOLPH3 expression was significantly associated with tumor invasion depth, TNM stage, and lymph node metastasis (p=0.001; p=0.020; p<0.05, respectively), but not with tumor length, tumor site, and age (p=0.363; p=0.819; p=0.599; p>0.05, respectively). VEGF expression and MVD in GOLPH3-positive CRC was significantly higher than in GOLPH3-negative CRC (VEGF: 69.7% vs 31.0%; MVD: 21.45 ± 9.39 vs 14.24 ± 8.97; p<0.05). GOLPH3 expression was negatively correlated with AI in CRC as shown by Spearman correlation analysis (r=-0.320, p<0.05). The 5-year survival rate in GOLPH3-negative CRC (69.4%) was significantly higher than in GOLPH3-positive CRC (48.6%) (log-rank test, p<0.05). High expression of GOLPH3 is found in CRC tissues."

According to the news reporters, the research concluded: "GOLPH3 expression may be a novel prognostic marker for CRC patients."

Our news journalists report that additional information may be obtained by contacting Y.T. Guo, Yan-Ta Guo, Cheng-Zhi Qiu, Wai-Shi Yu, Xiao-Feng Yang, Ming-Zhen Wang, Dept. of General Surgery, the Second Affiliated Hospital of Fujian Medical University, Quanzhou 362000, Fujian Province, People's Republic of China. Additional authors for this research include C.Z. Qiu, Z.X. Huang, W.S. Yu, X.F. Yang and M.Z Wang.

**Herpesvirus Diseases and Conditions**

**Studies in the Area of Cytomegalovirus Reported from Chang Gung University**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Herpesvirus Diseases and Conditions - Cytomegalovirus have been published. According to news reporting originating from Taoyuan, Taiwan, by NewsRx correspondents, research stated, "Esophagitis is the second most common gastrointestinal manifestation of cytomegalovirus (CMV) infection after colitis. CMV esophagitis has been reported in patients who have undergone transplantation, are on long-term renal dialysis, or who have the human immunodeficiency virus infection."

Our news editors obtained a quote from the research from Chang Gung University, "This study aimed to investigate the clinical characteristics and manifestations of CMV esophagitis in patients who underwent diagnostic endoscopy. A total of 16 patients with histologically proven CMV infection were identified from 1539 patients with esophageal ulcers and analyzed retrospectively (January 2006 to December 2013). Patients’ personal data (age, smoking, and alcohol consumption), underlying systemic diseases (diabetes mellitus, end-stage renal disease, and chronic obstructive pulmonary disease), malignancy, indication for esophagastroduodenoscopy, endoscopic characteristics, and diagnostic methods (pathological or serological findings) were collected for further analysis. Among the patients with CMV esophagitis, the mean age was 59.94 years (range, 23-84 years). The male: female ratio was 1.67:1. Odynophagia and epigastralgia were common symptoms. Of the 16 patients, 3 (18.75%) were infected with the human immunodeficiency virus and 9 (56.25%) had an underlying malignancy, including lung cancer (6 patients), esophageal cancer (2 patients), gastric cancer (1 patient), ampulla of Vater cancer (1 patient), and lymphoma (1 patient). Six of the 9 patients (66.7%) with malignancy had been administered concurrent chemoradiotherapy (CCRT). In this study, patients with malignancy who had been administered CCRT were at increased risk for CMV esophagitis, which had not been reported before in the literature."

According to the news editors, the research concluded: "CMV esophagitis should be considered as a potential treatment-related complication of CCRT."

The news editors report that additional information may be obtained by contacting C.T. Chiu, Chang Gung University, Coll Med, Taoyuan, Taiwan. Additional authors for this research include C.J. Kuo, W.R. Lin, C.M. Hsu, Y.P. Ho, C.J. Lin, M.Y. Su, C.T. Chiu, C.L. Wang and K.H. Chen.

Studies in the Area of Diabetic Nephropathy Reported from University of Cairo (Anti-diabetic and renoprotective effects of aliskiren in streptozotocin-induced diabetic nephropathy in female rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Diabetic Nephropathy is now available. According to news reporting originating from Cairo, Egypt, by NewsRx correspondents, research stated, "Since chronic kidney disease due to diabetic nephropathy (DN) is becoming an ever larger health burden worldwide, more effective therapies are desperately needed. In the present study, the anti-diabetic and renoprotective effects of aliskiren have been evaluated in streptozotocin (STZ)-induced DN in rats."

Our news editors obtained a quote from the research from the University of Cairo, "DN was induced by a single intraperitoneal injection of STZ (65 mg/kg). Three weeks after STZ, rats were divided into four groups; normal, diabetic, diabetic treated with gliclazide (10 mg/kg/day) for 1 month, and diabetic treated with aliskiren (50 mg/kg/day) for 1 month. At the end of the experiment, mean arterial blood pressure and heart rate were recorded. Rats were then euthanized and serum was separated for determination of glucose, insulin, kidney function tests, superoxide dismutase activity (SOD), adiponectin, and tumor necrosis factor-alpha (TNF-alpha). One kidney was used for estimation of malondialdehyde (MDA), reduced glutathione (GSH), and nitric oxide (NO) contents. Other kidney was used for histopathological study and immunohistochemical measurement of caspase-3 and transforming growth factor beta (TGF-beta). In addition, islets of Langerhans were isolated from normal rats by collagenase digestion technique for in vitro study. Aliskiren normalized STZ-induced hyperglycemia, increased insulin level both in vivo and in vitro, normalized kidney function tests and blood pressure, and alleviated STZ-induced kidney histopathological changes. This could be related to the ability of aliskiren toward preserving hemodynamic changes and alleviating oxidative stress and inflammatory and apoptotic markers induced by STZ in rats. However, aliskiren was more effective than gliclazide in relieving STZ-induced DN. These findings support the beneficial effect of aliskiren treatment in DN which could be attributed to its anti-diabetic, renoprotective, antioxidant, anti-inflammatory, and anti-apoptotic effects."

According to the news editors, the research concluded: "Moreover, clinical studies are required to establish the effectiveness of aliskiren treatment in patients suffering from hypertension and diabetes."

For more information on this research see: Anti-diabetic and renoprotective effects of aliskiren in streptozotocin-induced diabetic nephropathy in female rats. Naunyn-Schmiedebergs Archives of Pharmacology, 2016;389(12):1315-1324. Naunyn-Schmiedebers Archives of Pharmacology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA.

Histone Deacetylase-3/CAGE Axis Targets EGFR Signaling and Regulates the Response to Anti-Cancer Drugs

Studies in the Area of Drug Resistance Reported from Kangwon National University

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Drug Resistance are discussed in a new report. According to news reporting originating in Chunchon, South Korea, by NewsRx journalists, research stated, "We have previously reported the role of miR-326-HDAC3 loop in anti-cancer drug-resistance. CAGE, a cancer/testis antigen, regulates the response to anti-cancer drug-resistance by forming a negative feedback loop with miR-200b."

The news reporters obtained a quote from the research from Kangwon National University, "Studies investigating the relationship between CAGE and HDAC3 revealed that HDAC3 negatively regulated the expression of CAGE. ChIP assays demonstrated the binding of HDAC3 to the promoter sequences of CAGE. However, CAGE did not affect the expression of HDAC3. We also found that EGFR signaling regulated the expressions of HDAC3 and CAGE. Anti-cancer drug-resistant cancer cell lines show an increased expression of pEGFR(Y845). HDAC3 was found to negatively regulate the expression of pEGFR(Y845). CAGE showed an interaction and co-localization with EGFR. It was seen that miR-326, a negative regulator of HDAC3, regulated the expression of CAGE, pEGFR(Y845), and the interaction between CAGE and EGFR. miR-326 inhibitor induced the binding of HDAC3 to the promoter sequences in anti-cancer drug-resistant Malme3M® cells, decreasing the tumorigenic potential of Malme3M® cells in a manner associated with its effect on the expression of HDAC3, CAGE and pEGFR(Y845). The down-regulation of HDAC3 enhanced the tumorigenic, angiogenic and invasion potential of the anti-cancer drug-sensitive Malme3M cells in CAGE-dependent manner. Studies revealed that PKCd was responsible for the increased expression of pEGFR (Y845) and CAGE in Malme3M® cells. CAGE showed an interaction with PKCd in Malme3M® cells."

According to the news reporters, the research concluded: "Our results show that HDAC3-CAGE axis can be employed as a target for overcoming resistance to EGFR inhibitors."

For more information on this research see: Histone Deacetylase-3/CAGE Axis Targets EGFR Signaling and Regulates the Response to Anti-Cancer Drugs. Molecules and Cells, 2016;39(3):229-41. (Springer - www.springer.com; Molecules and Cells -

Dysplasia

Studies in the Area of Dysplasia Reported from Baylor University College of Medicine (Phenotypic Expansion of TBX4 Mutations to Include Acinar Dysplasia of the Lungs)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Dysplasia is the subject of a report. According to news reporting originating in Houston, Texas, by NewsRx journalists, research stated, "Mutations in the T-box transcription factor TBX4 gene have been reported in patients with Ischiocoxopodopatellar syndrome (MIM# 147891) and childhood-onset pulmonary arterial hypertension."

Financial supporters for this research include US National Heart, Lung, and Blood Institute (NHLBI), National Organization for Rare Disorders (NORD), US National Human Genome Research Institute (NHGRI)/NHLBI, National Institute of Neurological Disorders and Stroke (NINDS).

The news reporters obtained a quote from the research from the Baylor University College of Medicine, "Whole exome sequencing of DNA from a 1 day old deceased newborn, with severe diffuse developmental lung disorder exhibiting features of acinar dysplasia, and her unaffected parents identified a de novo TBX4 missense mutation p.E86Q (c.256G >C) in the DNA-binding T-box domain. We propose phenotypic expansion of the TBX4-related clinical disease spectrum to include acinar dysplasia of the lungs."

According to the news reporters, the research concluded: "The reported mutation is the first identified genetic variant causative for acinar dysplasia."

Our news correspondents report that additional information may be obtained by contacting P. Stankiewicz, Baylor College of Medicine, Dept. of Mol & Human Genet, Houston, TX 77030, United States. Additional authors for this research include Z.H. Coban-
Hormones - Estradiol Congeners

Studies in the Area of Estradiol Congeners Reported from University of Cape Town (Anthropometric Measurements, Serum Reproductive Hormonal Levels and Sexual Development among Boys in the Rural Western Cape, South Africa)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hormones - Estradiol Congeners is now available. According to news originating from Cape Town, South Africa, by NewsRx correspondents, research stated, "Data on growth and sexual maturation among boys from the rural Western Cape in South Africa is limited. A cross-sectional study of 269 school boys was conducted testing for serum luteinizing hormone (LH), follicle stimulating hormone (FSH), testosterone, sex hormone binding globulin (SHBG) and estradiol (E2); height, weight and body mass index (BMI); sexual maturity (using Tanner Stages) and a questionnaire (demographic and medical history)."

Our news journalists obtained a quote from the research from the University of Cape Town, "The median age at pubertal onset (Tanner Stage 2) and Tanner Stage 5 was 11.6 and 14.7 years, respectively. The median testicular volume was 5.5 mL at Tanner Stage 2 increasing from 2.5 mL at Tanner Stage 1 to 14.7 mL at Tanner Stage 5. Height and weight measurements were <25th & 50th percentile references at Tanner Stages 1-3. Controlling for confounders, serum FSH and LH increased (p < 0.05) from Tanner Stage 1 to 4 (by 4.1 and 3 mL respectively), and serum testosterone and estradiol increased after Tanner Stage 2 (by 12.7 nmol/L and 59.5 pmol/L respectively). These results indicate some delays in pubertal development of boys in the rural Western Cape when compared to boys from other settings possibly due to nutritional, socio-economic and environmental exposures. Changes in serum hormone levels were consistent with other populations."

According to the news editors, the research concluded: "Initiatives to improve nutrition amongst Western Cape rural communities are recommended."

For more information on this research see: Anthropometric Measurements, Serum Reproductive Hormonal Levels and Sexual Development among Boys in the Rural Western Cape, South Africa. International Journal of Environmental Research and Public Health, 2016;13(12):196-208. Studies in the Area of GABA Receptors Reported from University of Leipzig [The alpha 2 beta 3 gamma 2 GABA(A) receptor preferring agonist NS11394 aggravates dystonia in the phenotypic dt(sz) model]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Membrane Proteins - GABA Receptors are presented in a new report. According to news reporting originating from Leipzig, Germany, by NewsRx correspondents, research stated, "Dystonia is a movement disorder, characterized by involuntary muscle contractions resulting in abnormal movements and/or postures. Antidystonic effects of benzodiazepines in patients with different types of dystonia could be replicated in the dt(sz) mutant hamster, a phenotypic model of paroxysmal dystonia."

Our news editors obtained a quote from the research from the University of Leipzig, "Compounds with preferred binding at specific subunits of the gamma aminobutyric acid type A (GABA(A)) receptor may provide a more beneficial spectrum of effects in comparison with benzodiazepines. We therefore examined the effects of the alpha 1 beta 3 gamma 2 GABA(A) receptor preferring compound zolpidem (2.0-10.0 mg/kg i.p.) and of the alpha 1 beta 3 gamma 2 GABA(A) receptor preferring compound NS11394 (3.0-30 mg/kg i.p.) on the severity of dystonia in the dtsz mutant in comparison with the benzodiazepine clonazepam (0.5-1.0 mg/kg i.p.). As expected, clonazepam exerted pronounced antidystonic effects. While zolpidem showed moderate beneficial effects, NS11394 significantly increased the severity of dystonia. The present results indicate for the first time that positive GABA(A) receptor modulators show contrary effects on dystonia dependent on their preference for alpha-subunits."

According to the news editors, the research concluded: "The potential link between alterations in GABA(A) receptor subunits and GABAergic disinhibition in dystonia deserves further attention in research on the pathophysiology and therapeutic targets."

For more information on this research see: The alpha 2 beta 3 gamma 2 GABA(A) receptor preferring agonist NS11394 aggravates dystonia in the phenotypic dt(sz) model. European Journal of Pharmacology, 2016;791():655-658. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Oncology - Gastric Cancer

Studies in the Area of Gastric Cancer Reported from Zhejiang University (Role of Prognostic Nutritional Index in patients with gastric cancer: a meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Gastric Cancer. According to news reporting originating in Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "The aim of this study was to determine the role of Prognostic Nutritional Index in predicting gastric cancer. EVIDENCE ACQUISITION: Studies were searched in PubMed, EMBASE and ISI Web of Science."

The news reporters obtained a quote from the research from Zhejiang University, "The hazard ratios and 95% confidence interval for survival estimate were extracted from the articles and the pooled HR was computed. EVIDENCE SYNTHESIS: Nine studies with 3203 participants met the inclusion criteria. Low PNI was associated with poor overall survival (pooled HR 1.92, 95% CI: 1.68-2.19)."

According to the news reporters, the research concluded: "PROGNOSTIC NUTRITIONAL INDEX was an effective indicator for the prognosis of gastric cancer."

Our news correspondents report that additional information may be obtained by contacting H. Lin, Zhejiang University, Sch Med, Dept. of Gen Surg, Sir Run Run Shaw Hosp, Hangzhou 30016, Zhejiang, People's Republic of China. Additional authors for this research include S.T. Zhai and H. Lin.

Biotechnology - Gene Therapy

Studies in the Area of Gene Therapy Reported from University of California (DNA Nanotechnology for Precise Control over Drug Delivery and Gene Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Biotechnology - Gene Therapy. According to news reporting from La Jolla, California, by NewsRx journalists, research stated, "Nanomedicine has been growing exponentially due to its enhanced drug targeting and reduced drug toxicity. It uses the interactions where nanotechnological components and biological systems communicate with each other to facilitate the delivery performance."

The news correspondents obtained a quote from the research from the University of
California, "At this scale, the physiochemical properties of delivery systems strongly affect their capacities. Among current delivery systems, DNA nanotechnology shows many advantages because of its unprecedented engineering abilities. Through molecular recognition, DNA nanotechnology can be used to construct a variety of nanostructures with precisely controllable size, shape, and surface chemistry, which can be appreciated in the delivery process. In this review, different approaches that are currently used for the construction of DNA nanostructures are reported."

According to the news reporters, the research concluded: "Further, the utilization of these DNA nanostructures with the well-defined parameters for the precise control in drug delivery and gene therapy is discussed."

Our news journalists report that additional information may be obtained by contacting C. Angell, Dept. of NanoEngineering, University of California, San Diego, La Jolla, CA, 92093, United States. Additional authors for this research include S. Xie, L. Zhang and Y. Chen.

**Glomerulosclerosis**

**Studies in the Area of Glomerulosclerosis Reported from Central South University (A novel heterozygous COL4A4 missense mutation in a Chinese family with focal segmental glomerulosclerosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Glomerulosclerosis. According to news originating from Changsha, People's Republic of China, by NewsRx correspondents, research stated, "Focal segmental glomerulosclerosis (FSGS) is the most common glomerular histological lesion associated with high-grade proteinuria and end-stage renal disease. Histologically, FSGS is characterized by focal segmental sclerosis with foot process effacement."

Financial support for this research came from New Xiangya Talent Project, China.

Our news journalists obtained a quote from the research from Central South University, "The aim of this study was to identify the disease-causing mutation in a four-generation Chinese family with FSGS. A novel missense mutation, c.1856G >A (p.Gly619Asp), in the collagen type IV alpha-4 gene (COL4A4) was identified in six patients and it co-segregated with the disease in this family. The variant is predicted to be disease-causing and results in collagen IV abnormalities. Our finding broadens mutation spectrum of the COL4A4
gene and extends the phenotypic spectrum of collagen IV nephropathies. Our study suggests that exome sequencing is a cost-effective and efficient approach for identification of disease-causing mutations in phenotypically complex or equivocal disorders."

According to the news editors, the research concluded: "Timely screening for COL4A3/COL4A4 mutations in patients with familial FSGS may help both accurately diagnose and treat these patients."

The news correspondents report that additional information may be obtained from H. Deng, Central South University, Xiangya Hosp 3, Dept. of Neurol, Changsha, Hunan, People's Republic of China. Additional authors for this research include P.Z. Hu, H.B. Xu, J.Z. Yuan, L.M. Yuan, W. Xiong, X. Deng and H. Deng.

**Heart Disorders and Diseases - Heart Disease**

**Studies in the Area of Heart Disease Reported from Washington University (Effect of Statin Therapy on Mortality in Older Adults Hospitalized with Coronary Artery Disease: A Propensity-Adjusted Analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Disease. According to news originating from St. Louis, Missouri, by NewsRx correspondents, research stated, "To examine the effect of statins on long-term mortality in older adults hospitalized with coronary artery disease (CAD). Retrospective analysis. University teaching hospital."

Our news journalists obtained a quote from the research from Washington University, "Individuals aged 80 and older (mean aged 85.2, 56% female) hospitalized from January 2006 to December 2010 with acute myocardial infarction (AMI), unstable angina pectoris, or chronic CAD and discharged alive (N = 1,262). Participants were divided into those who did (n = 913) and did not (n = 349) receive a discharge prescription for a statin. All-cause mortality over a median follow-up of 3.1 years. Participants treated with statins were more likely to be male, to have a primary diagnosis of AMI, to have traditional cardiovascular risk factors, and to receive other standard cardiovascular medications in addition to statins. In unadjusted analysis, statin therapy was associated with lower mortality (hazard ratio (HR) = 0.83, 95%
confidence interval (CI) = 0.71-0.96). After adjustment for baseline differences between groups and propensity for receiving statin therapy, the effect of statins on mortality was no longer significant (HR = 0.88, 95% CI = 0.74-1.05). The association between statins and mortality was similar in participants aged 80 to 84 and those aged 85 and older. In this cohort of older adults hospitalized with CAD, statin therapy had no significant effect on long-term survival after adjustment for between-group differences."

According to the news editors, the research concluded: "These findings, although preliminary, call into question the benefit of statin therapy for secondary prevention in a real-world population of adults aged 80 and older and underscore the need for shared decision-making when prescribing statins in this age group."

The news correspondents report that additional information may be obtained from M.W. Rich, Washington University, Sch Med, St Louis, MO, United States. Additional authors for this research include E. Novak and M.W. Rich.

Surgery - Heart Surgery

Studies in the Area of Heart Surgery Reported from Children's Hospital (Preoperative and Intraoperative Predictive Factors of Immediate Extubation After Neonatal Cardiac Surgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Surgery - Heart Surgery have been published. According to news originating from Omaha, Nebraska, by NewsRx correspondents, research stated, "We sought to identify preoperative and intraoperative predictors of immediate extubation (IE) after open heart surgery in neonates. The effect of IE on the postoperative intensive care unit (ICU) length of stay (LOS), cost of postoperative ICU care, operating room turnover, and reintubation rates was assessed."

Our news journalists obtained a quote from the research from Children's Hospital, "Patients younger than 31 days who underwent cardiac surgery with cardiopulmonary bypass (January 2010 to December 2013) at a tertiary-care children's hospital were studied. Immediate extubation was defined as successful extubation before termination of anesthetic care. Data on
preoperative and intraoperative variables were compared using descriptive, bivariate, and multivariate statistics to identify the predictors of IE. Propensity scores were used to assess effects of IE on ICU LOS, the cost of ICU care, reintubation rates, and operating room turnover time. One hundred forty-eight procedures done at a median age of 7 days resulted in 45 IEs (30.4%). The IE rate was 22.2% with single-ventricle heart disease. Independent predictors of IE were the absence of the need for preoperative ventilatory assistance, higher gestational age, anesthesiologist, and shorter cardiopulmonary bypass. Immediate extubation was associated with shorter ICU LOS (8.3 versus 12.7 days; p < 0.0001) and lower cost of ICU care (mean postoperative ICU charges, $157,449 versus $198,197; p < 0.0001) with no significant difference in the probability of reintubation (p = 0.7). Immediate extubation was associated with longer operating room turnover time (38.4 versus 46.7 minutes; p = 0.009). Immediate extubation was accomplished in 30.4% of neonates undergoing open heart surgery involving cardiopulmonary bypass. Immediate extubation was associated with lesser ICU LOS, postoperative ICU costs, and minimal increase in operating room turnover time, but without an increase in reintubation rates.

According to the news editors, the research concluded: "Low gestational age, preoperative ventilatory support requirement, and prolonged cardiopulmonary bypass time were inversely associated with the ability to accomplish IE."

The news correspondents report that additional information may be obtained from J. Varghese, Childrens Hosp & Med Center, Dept. of Biostat, Omaha, NE, United States. Additional authors for this research include S. Kutty, I. Abdullah, S. Hall, V. Shostrom and J.M. Hammel.

**Cardiovascular Diseases and Conditions**

**Studies in the Area of Hypertension Reported from Lanzhou University Second Hospital (Clinical Practice Guidelines for Hypertension: Evaluation of Quality Using the AGREE II Instrument)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Hypertension have been presented. According to news reporting originating from Lanzhou, People's Republic of China, by NewsRx correspondents, research stated, "Hypertension is an important public
health challenge. The purpose of clinical practice guidelines (CPGs) is to provide explicit recommendations for clinical practice, reduce inadequate variations, optimize results, minimize risks, and promote cost-effective practice."

Financial support for this research came from West Light Foundation of The Chinese Academy of Sciences.

Our news editors obtained a quote from the research from Lanzhou University Second Hospital, "Therefore, a highly methodological quality development process for CPGs is more likely to yield a CPG that contains relevant and appropriate recommendations. To assess the quality of CPGs for the prevention and treatment of hypertension, a systematic search was performed using the following literature databases: PubMed, Excerpta Medica Database (EMBASE), Web of Science, the National Guideline Clearinghouse (NGC), Chinese National Knowledge Infrastructure (CNKI), Wanfang Data, VIP, and Chinese Biomedical Literature Database (CBM). Then the Appraisal of Guidelines for Research and Evaluation II (AGREE II) instrument was used to assess the quality of the CPGs. Forty-one CPGs were identified (ten CPGs in Chinese and 31 CPGs in English). The results for the overall recommendation were as follows: strongly recommended (15 %), recommended (29 %), weakly recommended (51 %), and not recommended (5 %). The scores for all domains (mean +/- A standard deviations) were 'scope and purpose' (58.65 +/- A 12.67 %), 'stakeholder involvement' (48.07 +/- A 11.41 %), 'rigor of development' (27.31 +/- A 12.29 %), 'clarity of presentation' (53.89 +/- A 11.09 %), 'applicability' (40.10 +/- A 13.33 %), and 'editorial independence' (38.75 +/- A 16.43 %). All differences were statistically insignificant for all domains (P > 0.05) according to publication time. CPGs using an evidence-based (EB) method were of a higher quality than non-EBs for all domains, but the differences were significant for the following domains: 'Scope and Purpose,' 'Rigor of Development,' 'Applicability,' and 'Editorial Independence' (P < 0.05). The scores for the CPGs developed based on associations and society appeared slightly higher than those developed by individuals. However, the differences were insignificant for all domains (P > 0.05). A more systematic approach for the development and report of these guidelines is recommended."

According to the news editors, the research concluded: "The AGREE II instrument can be a useful tool to improve the quality of guidelines."

The news editors report that additional information may be obtained by contacting J. Yu, Lanzhou Univ Second Hosp, Hosp Cardiol, Sect Hypertens, Lanzhou 730030, People's Republic of China. Additional authors for this research include K. Zhao, Z.G. Bai, J. Yu and F. Bai.

Studies in the Area of Hypertension Reported from University of Portsmouth (Utilisation and Tolerability of Aliskiren in the Primary Care Setting in England)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Hypertension. According to news reporting out of Portsmouth, United Kingdom, by NewsRx editors, research stated, "Aliskiren (Rasilez), a direct renin inhibitor, is indicated for the treatment of essential hypertension. A postmarketing prescription-event monitoring (PEM) study was conducted in England to monitor the safety and utilization of aliskiren."

Our news journalists obtained a quote from the research from the University of Portsmouth, "Summary statistics and event incidence densities were calculated. The cohort consisted of 6385 individuals with a median age of 68 years (interquartile range, 59-76). Aliskiren was largely prescribed for its licensed indication of hypertension (93.3%) and was reported as effective by the prescriber in 77.4% of individuals. Frequently reported clinical events during treatment were diarrhea (3.1% of on-treatment events), malaise/lassitude (3.0%), and nausea/vomiting (1.2%), which were also common reasons for treatment cessation. Renal events were rare, with 24 cases probably or possibly related to aliskiren use, and four of which were classified as acute renal failure using RIFLE (Risk Injury Failure Loss End-Stage Kidney Disease) criteria."

According to the news editors, the research concluded: "These results should be used in conjunction with other clinical and pharmacoepidemiologic studies to optimize the safe prescribing of aliskiren."

Our news journalists report that additional information may be obtained by contacting S.A.W. Shakir, University of Portsmouth, Dept. of Sch Pharm & Biomed Sci, Portsmouth, Hants, United Kingdom. Additional authors for this research include C. Doe, D. Layton and S.A.W. Shakir.

**Immunology - Immunoglobulins**

**Studies in the Area of Immunoglobulins Reported from Technical University (Spontaneous Isopeptide Bond Formation as a Powerful Tool for Engineering Site-Specific Antibody-Drug Conjugates)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immunology - Immunoglobulins are presented in a new report. According to news originating from Darmstadt, Germany, by NewsRx correspondents, research stated, "Spontaneous isopeptide bond formation, a stabilizing posttranslational modification that can be found in gram-positive bacterial cell surface proteins, has previously been used to develop a peptide-peptide ligation technology that enables the polymerization of tagged-proteins catalyzed by SpyLigase. Here we adapted this technology to establish a novel modular antibody labeling approach which is based on isopeptide bond formation between two recognition peptides, SpyTag and KTag."

Our news journalists obtained a quote from the research from Technical University, "Our labeling strategy allows the attachment of a reporting cargo of interest to an antibody scaffold by fusing it chemically to KTag, available via semi-automated solid-phase peptide synthesis (SPPS), while equipping the antibody with SpyTag. This strategy was successfully used to engineer site-specific antibody-drug conjugates (ADCs) that exhibit cytotoxicities in the subnanomolar range."

According to the news editors, the research concluded: "Our approach may lead to a new class of antibody conjugates based on peptide-tags that have minimal effects on protein structure and function, thus expanding the toolbox of site-specific antibody conjugation."

The news correspondents report that additional information may be obtained from H. Kolmar, Technical Univ Darmstadt, Inst Organ Chem & Biochem, D-64287 Darmstadt, Germany. Additional authors for this research include B. Piater, B. Zakeri, T. Eichhorn, F. Fischer, C. Deutsch, S. Becker, L. Toleikis, B. Hock, U.A.K. Betz and H. Kolmar.

Keywords for this news article include: Darmstadt, Germany, Europe, Drugs and Therapies, Drug Development, Immunoglobulins, Blood Proteins, Engineering, Technology, Proteomics, Immunology, Antibodies, Peptides, Technical University.

**Oncology - Kidney Cancer**

**Studies in the Area of Kidney Cancer Reported from University of Cambridge (A randomised, phase II study of nintedanib or sunitinib in previously untreated patients with advanced renal cell cancer: 3-year results)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Kidney Cancer have been presented. According to news reporting originating from Cambridge, United Kingdom, by NewsRx correspondents, research stated, "This exploratory study evaluated the safety/efficacy of nintedanib or sunitinib as first-line therapy in patients with advanced renal cell carcinoma (RCC). Ninety-six patients were randomised (2:1) to either nintedanib (200 mg twice daily) or sunitinib (50 mg kg(-1) once daily (4 weeks on treatment; 2 weeks off))."

Our news editors obtained a quote from the research from the University of Cambridge, "Primary endpoint was progression-free survival (PFS) at 9 months. P-values reported are descriptive only; the study was not powered for such comparisons. Progression-free survival at 9 months was comparable between nintedanib and sunitinib (43.1% vs 45.2%, respectively; p=0.85). Median PFS was 8.4 months in each group (hazard ratio (HR), 1.12; 95% confidence interval (CI): 0.70-1.80; p=0.64). Median overall survival was 20.4 and 21.2 months for nintedanib and sunitinib, respectively (HR, 0.92; 95% CI: 0.54-1.56; p=0.76). Overall incidence of any grade adverse events (AEs) was comparable (90.6% vs 93.8%); AEs grade ≥ 3 were lower with nintedanib than sunitinib (48.4% vs 59.4%). Nintedanib was associated with lower incidences of some AEs typical of antiangiogenic tyrosine kinase inhibitors (TKIs): hypertension, hypothyroidism, hand-foot syndrome, cardiac disorders and haematological abnormalities."

According to the news editors, the research concluded: "In patients with advanced RCC, nintedanib has promising efficacy and similar tolerability to sunitinib, and a manageable safety profile with fewer TKI-associated AEs."

For more information on this research see: A randomised, phase II study of nintedanib or sunitinib in previously untreated patients with advanced renal cell cancer: 3-year results. British Journal of Cancer, 2015;113(8):1140-7. (Nature Publishing Group - www.nature.com/; British Journal of Cancer - www.nature.com/bjc/)

The news editors report that additional information may be obtained by contacting T. Eisen, Dept. of Oncology, Cambridge University Health Partners, Addenbrooke's Hospital, Cambridge, UK. Transplant Medicine - Kidney Transplants

Studies in the Area of Kidney Transplants Reported from Royal Devon and Exeter NHS Foundation Trust (Prevention of recurrence of atypical hemolytic uremic syndrome post renal transplant with the use of higher-dose eculizumab)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transplant Medicine - Kidney Transplants. According to news reporting out of Exeter, United Kingdom, by NewsRx editors, research stated, "Eculizumab, a terminal complement inhibitor, has recently been used successfully to both prevent and treat the recurrence of atypical hemolytic uremic syndrome (aHUS) post renal transplantation. We describe a case that highlights the need to monitor the effects of eculizumab on the complement system and in this case alter the dosage."

Our news journalists obtained a quote from the research from Royal Devon and Exeter NHS Foundation Trust, "Despite taking the standard recommended dose of eculizumab for an adult, this aHUS patient developed a low-grade thrombotic microangiopathy on biopsy within months of renal transplantation. Complement assays (through CH50) showed small amounts of residual terminal pathway activity suggesting inadequate complement blockade on 1,200 mg eculizumab every 2 weeks. Following an increase in the dose of eculizumab to 1,500 mg every 2 weeks, lactate dehydrogenase (LDH), proteinuria, and creatinine decreased, and CH50 assay showed 0%.

According to the news editors, the research concluded: "This case emphasizes the need to monitor clinical parameters and complement activity to ensure that adequate therapeutic blockade is achieved."

For more information on this research see: Prevention of recurrence of atypical hemolytic uremic syndrome post renal transplant with the use of higher-dose eculizumab. Clinical Nephrology, 2016;86(4):200-202. Clinical Nephrology can be contacted at: Dustri-Verlag Dr Karl Feistle, Bahnhofstrasse 9 Postfach 49, D-82032 Deisenhofen-Muenchen, Germany.

Our news journalists report that additional information may be obtained by contacting A. Riddell, Royal Devon & Exeter Hospital, Exeter EX2 5DW, Devon, United Kingdom. Additional authors for this research include T. Goodship and C. Bingham.

immune response which sustains renal injury and contributes to the development of delayed graft function (DGF). Triggering receptor expressed on myeloid cells-1 (TREM-1) is a pro-inflammatory evolutionary conserved pattern recognition receptor expressed on a variety of innate immune cells."

The news correspondents obtained a quote from the research from the University of Amsterdam, "TREM-1 expression increases following acute and chronic renal injury. However, the function of TREM-1 in renal IR is still unclear. Here, we investigated expression and function of TREM-1 in a murine model of renal IR using different TREM-1 inhibitors: LP17, LR12 and TREM-1 fusion protein. In a human study, we analyzed the association of nonsynonymous single nucleotide variants in the TREM1 gene in a cohort comprising 1263 matching donors and recipients with post-transplant outcomes, including DGF. Our findings demonstrated that, following murine IR, renal TREM-1 expression increased due to the influx of Trem1 mRNA expressing cells detected by in situ hybridization. However, TREM-1 interventions by means of LP17, LR12 and TREM-1 fusion protein did not ameliorate IR-induced injury. In the human renal transplant cohort, donor and recipient TREM1 gene variant p. Thr25Ser was not associated with DGF, nor with biopsy-proven rejection or death-censored graft failure."

According to the news reporters, the research concluded: "TREM-1 does not play a major role during experimental renal IR and after kidney transplantation."

Our news journalists report that additional information may be obtained by contacting A. Tammaro, University of Amsterdam, Academy Med Center, Dept. of Pathol, Amsterdam, Netherlands. Additional authors for this research include J. Kers, D. Emal, I. Stroo, G.J.D. Teske, L.M. Butter, N. Claessen, J. Damman, M. Derive, G. Navis, S. Florquin, J.C. Leemans and M.C. Dessing.

Oncology - Lobular Cancer

Studies in the Area of Lobular Cancer Reported from University Medical Center (p120-Catenin Is Critical for the Development of Invasive Lobular Carcinoma in Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lobular Cancer have been published. According to news reporting from Utrecht, Netherlands, by NewsRx journalists, research stated, "Loss of E-cadherin expression is causal to the development of invasive lobular breast carcinoma (ILC). E-cadherin loss leads to dismantling of the adherens junction and subsequent translocation of p120-catenin (p120) to the cytosol and nucleus."
Funders for this research include NWO, Stichting vrienden UMC Utrecht (NL), KWF Kankerbestrijding.

The news correspondents obtained a quote from the research from University Medical Center, "Although p120 is critical for the metastatic potential of ILC through the regulation of Rock-dependent anoikis resistance, it remains unknown whether p120 also contributes to ILC development. Using genetically engineered mouse models with mammary gland-specific inactivation of E-cadherin, p120 and p53, we demonstrate that ILC formation induced by E-cadherin and p53 loss is severely impaired upon concomitant inactivation of p120. Tumors that developed in the triple-knockout mice were mostly basal sarcomatoid carcinomas that displayed overt nuclear atypia and multinucleation. In line with the strong reduction in ILC incidence in triple-knockout mice compared to E-cadherin and p53 double-knockout mice, no functional redundancy of p120 family members was observed in mouse ILC development, as expression and localization of ARVCF, p0071 or delta-catenin was unaltered in ILCs from triple-knockout mice."

According to the news reporters, the research concluded: "We show that loss of p120 in the context of the p53-deficient mouse models is dominant over E-cadherin inactivation and its inactivation promotes the development of basal, epithelial-to-mesenchymal-transition (EMT)-type invasive mammary tumors."

Our news journalists report that additional information may be obtained by contacting P.W.B. Derksen, Univ Med Center Utrecht, Dept. of Pathol, Utrecht, Netherlands. Additional authors for this research include S. Klarenbeek, T.M. Braumuller, I. Hofmann, P. van der Groep, N. ter Hoeve, E. van der Wall, J. Jonkers and P.W.B. Derksen.

**Oncology - Lung Cancer**

**Studies in the Area of Lung Cancer Reported from McMaster University (Comprehensive Clinical Staging for Resectable Lung Cancer: Clinicopathological Correlations and the Role of Brain MRI)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lung Cancer. According to news reporting originating from Hamilton, Canada, by NewsRx correspondents, research stated, "In our model of comprehensive clinical staging (CCS) for lung cancer, patients with a
computerized tomography scan of the chest and upper abdomen not showing distant metastases will then routinely undergo whole body positron emission tomography/computerized tomography and magnetic resonance imaging (MRI) of the brain before any therapeutic decision. Our aim was to determine the accuracy of CCS and the value of brain MRI in this population."

Our news editors obtained a quote from the research from McMaster University, "A retrospective analysis of a prospectively entered database was performed for all patients who underwent lung cancer resection from January 2012 to June 2014. Demographics, clinical and pathological stage (seventh edition of the American Joint Committee on Cancer/Union for International Cancer Control tumor, node, and metastasis staging manual), and costs of staging were collected. Correlation between clinical and pathological stage was determined. Of 315 patients with primary lung cancer, 55.6% were female and the mean age was 70.9.6 years. When correlation was analyzed without consideration for sub-stages A and B, 49.8% of patients (158 of 315) were staged accurately, 39.7% (125 of 315) were overstaged, and 10.5% (32 of 315) were understaged. Only 4.7% of patients (15 of 315) underwent surgery without appropriate neoadjuvant treatment. Preoperative brain MRI detected asymptomatic metastases in four of 315 patients (1.3%). At a median postoperative follow-up of 19 months (range 6-43), symptomatic brain metastases developed in seven additional patients. The total cost of CCS in Canadian dollars was $367,292 over the study period, with $117,272 (31.9%) going toward brain MRI. CCS is effective for patients with resectable lung cancer, with less than 5% of patients being denied appropriate systemic treatment before surgery."

According to the news editors, the research concluded: "Brain MRI is a low-yield and high-cost intervention in this population, and its routine use should be questioned."

The news editors report that additional information may be obtained by contacting W.C. Hanna, McMaster University, St Josephs Healthcare Hamilton, Div Thorac Surg, Hamilton, ON L8N 4A6, Canada. Additional authors for this research include N. Andruszkiewicz, L. Schneider, C. Schieman, C.J. Finley, Y. Shargall, C. Fahim, F. Farrokhyar and W.C. Hanna.

Oncology - Lymphoma

Studies in the Area of Lymphoma Reported from J. Gayoso and Co-Researchers (Busulfan-based reduced intensity conditioning regimens for haploidentical transplantation in relapsed/refractory Hodgkin lymphoma: Spanish multicenter experience)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Lymphoma are discussed in a new report. According to news reporting originating from Madrid, Spain, by NewsRx correspondents, research stated, "Relapsed or refractory Hodgkin lymphoma (advanced HL) still remains a therapeutic challenge. Recently, unmanipulated haploidentical related donor transplant with reduced conditioning regimen (HAPLO-RIC) and post-transplant cyclophosphamide (PT-Cy) as GvHD prophylaxis has became a promising rescue strategy potentially available to almost every patient."

Our news editors obtained a quote from the research, "This paper reports our multicenter experience using an IV busulfan-based HAPLO-RIC regimen and PT-Cy in the treatment of 43 patients with advanced HL. Engraftment occurred in 42 patients (97.5%), with a median time to neutrophil and platelet recovery of 18 and 26 days. Cumulative incidences of grades II-IV acute GvHD and chronic GvHD were 39% and 19%, respectively. With a median follow-up of 25.5 months for survivors, 27 patients are alive, with 22 of them disease free. Cumulative incidences of 1-year non-relapse mortality and relapse at 2 years were 21% and 24%, respectively. The estimated 2-year event-free survival (EFS) and overall survival (OS) were 48% and 58%, respectively. CR prior to HAPLO-RIC correlated with better EFS (78.5% vs 33.5%; P = 0.015) and OS (86% vs 46%; P = 0.044)."

According to the news editors, the research concluded: "Our findings further confirm prior reports using HAPLO-RIC in advanced HL in a multicenter approach employing an IV busulfan-based conditioning regimen."

For more information on this research see: Busulfan-based reduced intensity conditioning regimens for haploidentical transplantation in relapsed/refractory Hodgkin lymphoma: Spanish multicenter experience. Bone Marrow Transplantation, 2016;51(10):1307-1312. Bone Marrow Transplantation can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/bmt/)

The news editors report that additional information may be obtained by contacting J. Gayoso, Inst Invest Sanitaria Gregorio Maranon, Madrid, Spain. Additional authors for this research include P. Balsalobre, M.J. Pascual, C. Castilla-Llorente, L. Lopez-Corral, M. Kwon, D. Serrano, J.L. Pinana, P. Herrera, C. Ferra, C. Pascual, I. Heras, P. Montesinos, A. Zabalza, L. Bento, A. FIGUERA, I. BUNO and J.L. DIEZ-MARTIN.

Cytoskeletal Proteins - Microfilament Proteins

Studies in the Area of Microfilament Proteins Reported from University of California (AMP-Activated Protein Kinase and Sirtuin 1 Coregulation of Cortactin Contributes to Endothelial Function)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cytoskeletal Proteins - Microfilament Proteins have been presented. According to news reporting originating in La Jolla, California, by NewsRx journalists, research stated, "Cortactin translocates to the cell periphery in vascular endothelial cells (ECs) on cortical-actin assembly in response to pulsatile shear stress. Because cortactin has putative sites for AMP-activated protein kinase (AMPK) phosphorylation and sirtuin 1 (SIRT1) deacetylation, we examined the hypothesis that AMPK and SIRT1 coregulate cortactin dynamics in response to shear stress."

The news reporters obtained a quote from the research from the University of California, "Approach and Results-Analysis of the ability of AMPK to phosphorylate recombinant cortactin and oligopeptides whose sequences matched AMPK consensus sequences in cortactin pointed to Thr-401 as the site of AMPK phosphorylation. Mass spectrometry confirmed Thr-401 as the site of AMPK phosphorylation. Immunoblot analysis with AMPK siRNA and SIRT1 siRNA in human umbilical vein ECs and EC-specific AMPK alpha 2 knockout mice showed that AMPK phosphorylation of cortactin primes SIRT1 deacetylation in response to shear stress. Immunoblot analyses with cortactin siRNA in human umbilical vein ECs, phospho-deficient T401A and phospho-mimetic T401D mutant, or aceto-deficient (9K/R) and aceto-mimetic (9K/Q) showed that cortactin regulates endothelial nitric oxide synthase activity. Confocal imaging and sucrose-density gradient analyses revealed that the phosphorylated/deacetylated cortactin translocates to the EC periphery facilitating endothelial nitric oxide synthase translocation from lipid to nonlipid raft domains. Knockdown of cortactin in vitro or genetic reduction of cortactin expression in vivo in mice substantially decreased the endothelial nitric oxide synthase-derived NO bioavailability. In vivo, atherosclerotic lesions increase in ApoE(-/-)/cortactin(+/-) mice, when compared with ApoE(-/-)/cortactin(+/-) littermates. AMPK phosphorylation of cortactin followed by SIRT1 deacetylation modulates the interaction of cortactin and cortical-actin in response to shear stress."

According to the news reporters, the research concluded: "Functionally, this AMPK/SIRT1 coregulated cortactin-F-actin dynamics is required for endothelial nitric oxide synthase subcellular translocation/activation and is atheroprotective."

For more information on this research see: AMP-Activated Protein Kinase and Sirtuin 1 Coregulation of Cortactin Contributes to Endothelial Function. Arteriosclerosis Thrombosis and Vascular Biology, 2016;36(12):2358-2368. Arteriosclerosis Thrombosis and Vascular Biology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

**Microscopy and Microanalysis**

**Studies in the Area of Microscopy and Microanalysis Reported from Chungbuk National University (Analysis of Ferrous on Ten-Eleven Translocation Activity and Epigenetic Modifications of Early Mouse Embryos by Fluorescence Microscopy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Microscopy and Microanalysis. According to news reporting originating in Cheongju, South Korea, by NewsRx journalists, research stated, "Iron is an essential trace element that plays important roles in the cellular function of all organs and systems. However, the function of Fe(II) in mammalian embryo development is unknown."

The news reporters obtained a quote from the research from Chungbuk National University, "In this study, we investigated the role of Fe(II) during preimplantation embryo development. Depletion of Fe(II) using thiosemicarbazone-24 (TSC24), a specific Fe(II) chelator, rescued quenching of the Fe(II)-sensitive fluorophore phen green-SK. After in vitro fertilization, TSC24 significantly reduced the cleavage rate as well as blastocyst formation. The hatch rate of blastocysts was also reduced with 1 pM TSC24 treatment (20.25?1.86 versus 42.28?12.96%, p<0.05). Blastocysts were cultured in leukemia inhibitory factor-free mouse embryonic stem cell culture medium with or without TSC24, and those with depleted Fe(II) displayed delayed attachment and lost the ability to induce embryoid body formation. To further explore the mechanism of Fe(II) in embryo development, we assessed the expression of 5-hydroxymethylcytosine (5hmC) and OCT4 in the pronuclear and blastocyst stages, respectively. We observed that Fe(II) reduced 5hmC and OCT4 expression, which could be explained by low ten-eleven translocation (TET) enzyme activity induced by TSC24 treatment."

According to the news reporters, the research concluded: "These findings demonstrate that Fe(II) is required for mammalian embryo development and that it facilitates the process via regulation of TET activity."

Our news correspondents report that additional information may be obtained by contacting M.H. Zhao, 1Dept. of Animal Sciences, Chungbuk National University, Cheongju 361-763, South Korea. Additional authors for this research include S. Liang, J. Guo, J.W. Choi, N.H. Kim, W.F. Lu and X.S Cui.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1017/S1431927616000040. This DOI is a link to an online electronic document that is either free or for purchase.

Surgery - Necrosectomy

Studies in the Area of Necrosectomy Reported from Weill Cornell Medical College (Endoscopic Therapy With Lumen-apposing Metal Stents Is Safe and Effective for Patients With Pancreatic Walled-off Necrosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Surgery - Necrosectomy are discussed in a new report. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "Endoscopic ultrasound-guided transmural drainage and necrosectomy have become the standard treatment for patients with pancreatic walled-off necrosis (WON). Lumen-apposing metal stents (LAMS) have shown success in the management of pancreatic fluid collections."

The news reporters obtained a quote from the research from Weill Cornell Medical College, "However, there are few data on their specific roles in management of WON. We investigated the efficacy and safety of LAMS in treatment of WON. We performed a retrospective multicenter case series of 124 patients with WON who underwent endoscopic transmural drainage by using LAMS at 17 tertiary care centers from January 2014 through May 2015. Patients underwent endoscopic ultrasound-guided cystogastrostomy or cystoenterostomy with placement of an LAMS into the WON collection. At the discretion of the endoscopist, we performed direct endoscopic necrosectomy, irrigation with hydrogen peroxide, and/or nasocystic drain placement. We performed endoscopic retrograde cholangiopancreatography with pancreatic duct stent placement when indicated. Concomitant therapies included direct endoscopic debridement (n = 78), pancreatic duct stent placement for leak (n = 19), hydrogen peroxide-assisted necrosectomy (n = 38), and nasocystic irrigation (n = 22). We collected data for a median time of 4 months (range, 1-34 months) after the LAMS placement. The primary outcomes were rates of technical success (successful placement of the LAMS), clinical success (resolution of WON, on the basis of image analysis, without need for further intervention via surgery or interventional radiology), and adverse events. The median size of the WON was 9.5 cm (range, 4-30 cm). Eight patients had 2 LAMS placed for multiport access, all with technical success (100%). Clinical success was achieved in 107 patients (86.3%) after 3 months of follow-up. Thirteen patients required a percutaneous drain, and 3 required a surgical intervention to manage their WON. The stents remained patent in 94% of patients (117 of 124) and migrated in 5.6% of patients (7 of 124). The median number of endoscopic interventions was 2 (range, 1-9 interventions). On the basis of a retrospective analysis of 124 patients, endoscopic therapy of WON by using LAMS is safe and effective."

According to the news reporters, the research concluded: "Creation of a large and sustained cystogastrostomy or cystoenterostomy tract is effective in the drainage and treatment of WON."

For more information on this research see: Endoscopic Therapy With Lumen-apposing Metal Stents Is Safe and Effective for Patients With Pancreatic Walled-off Necrosis.

Oncology - Non-Small Cell Lung Cancer

Studies in the Area of Non-Small Cell Lung Cancer Reported from University of Texas (Local consolidative therapy versus maintenance therapy or observation for patients with oligometastatic non-small-cell lung cancer without progression after ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Non-Small Cell Lung Cancer is the subject of a report. According to news reporting out of Houston, Texas, by NewsRx editors, research stated, "Evidence from retrospective studies suggests that disease progression after first-line chemotherapy for metastatic non-small-cell lung cancer (NSCLC) occurs most often at sites of disease known to exist at baseline. However, the potential effect of aggressive local consolidative therapy for patients with oligometastatic NSCLC is unknown."

Our news journalists obtained a quote from the research from the University of Texas, "We aimed to assess the effect of local consolidative therapy on progression-free survival. In this multicentre, randomised, controlled, phase 2 study, eligible patients from three hospitals had histological confirmation of stage IV NSCLC, three or fewer metastatic disease lesions after first-line systemic therapy, an Eastern Cooperative Oncology Group performance status score of 2 or less, had received standard first-line systemic therapy, and had no disease progression before randomisation. First-line therapy was four or more cycles of platinum doublet therapy or 3 or more months of EGFR or ALK inhibitors for patients with EGFR mutations or ALK rearrangements, respectively. Patients were randomly assigned (1: 1) to either local consolidative therapy ([chemo] radiotherapy or resection of all lesions) with or without subsequent maintenance treatment or to maintenance treatment alone, which could be observation only. Maintenance treatment was recommended based on a list of approved regimens, and observation was defined as close surveillance without cytotoxic treatment."
Randomisation was not masked and was balanced dynamically on five factors: number of metastases, response to initial therapy, CNS metastases, intrathoracic nodal status, and EGFR and ALK status. The primary endpoint was progression-free survival analysed in all patients who were treated and had at least one post-baseline imaging assessment. The study is ongoing but not recruiting participants. This study is registered with ClinicalTrials.gov, number NCT01725165. Between Nov 28, 2012, and Jan 19, 2016, 74 patients were enrolled either during or at the completion of first-line systemic therapy. The study was terminated early after randomisation of 49 patients (25 in the local consolidative therapy group and 24 in the maintenance treatment group) as part of the annual analyses done by the Data Safety Monitoring Committee of all randomised trials at MD Anderson Cancer Center, and before a planned interim analysis of 44 events. At a median follow-up time for all randomised patients of 12.39 months (IQR 5.52-20.30), the median progression-free survival in the local consolidative therapy group was 11.9 months (90% CI 5.7-20.9) versus 3.9 months (2.3-6.6) in the maintenance treatment group (hazard ratio 0.35 [90% CI 0.18-0.66], log-rank p=0.0054). Adverse events were similar between groups, with no grade 4 adverse events or deaths due to treatment. Grade 3 adverse events in the maintenance therapy group were fatigue (n=1) and anaemia (n=1) and in the local consolidative therapy group were oesophagitis (n=2), anaemia (n=1), pneumothorax (n=1), and abdominal pain (n=1, unlikely related). Local consolidative therapy with or without maintenance therapy for patients with three or fewer metastases from NSCLC that did not progress after initial systemic therapy improved progression-free survival compared with maintenance therapy alone."

According to the news editors, the research concluded: "These findings suggest that aggressive local therapy should be further explored in phase 3 trials as a standard treatment option in this clinical scenario."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/S1470-2045(16)30532-0. This DOI is a link to an online electronic document that is either free or for purchase.

Eye Diseases and Conditions - Open-Angle Glaucoma

Studies in the Area of Open-Angle Glaucoma Reported from Anhui Medical University (Identification of Mutations in Myocilin and Beta-1,4-galactosyltransferase 3 Genes in a Chinese Family with Primary Open-angle Glaucoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Eye Diseases and Conditions - Open-Angle Glaucoma is the subject of a report. According to news reporting out of Anhui, People's Republic of China, by NewsRx editors, research stated, "Glaucoma is a major cause of irreversible blindness worldwide. There is evidence showing that a subset of the disease is genetically determined."

Our news journalists obtained a quote from the research from Anhui Medical University, "In this study, we screened for mutations in chromosome 1q-linked open-angle glaucoma (GLC1A) in a Chinese family with primary open-angle glaucoma (POAG). A total of 23 members from five generations of a family were enrolled and underwent thorough ophthalmologic examinations. In addition, 200 unrelated healthy Chinese controls were also recruited as normal control. GLC1A gene was amplified by polymerase chain reaction, and DNA sequencing was performed to screen for mutations. Six members were diagnosed as POAG, with severe clinical manifestations, and history of high intraocular pressures. The mean age of disease onset was 26.3 years. However, the others were asymptomatic. In six affected and three asymptomatic members, gene sequencing revealed a mutation c. C1456T in exon 3 of myocilin gene (MYOC). Furthermore, we also identified a novel mutation c. G322A in beta-1,4-galactosyltransferase 3 (B4GALT3) gene in all six affected and three asymptomatic members, which was not reported previously in POAG patients. The two newly identified variants were absent in other family members as well as controls. The mutations c. 1456C <T (p. L486F) in MYOC and c. 322G <A (p."

According to the news editors, the research concluded: "V108I) in B4GALT3 are likely responsible for the pathogenesis of POAG in this family."

Our news journalists report that additional information may be obtained by contacting D.Q. Ye, Anhui Medical University, Sch Public Hlth, Dept. of Epidemiol & Biostat, Hefei 230032, Anhui, People's Republic of China. Additional authors for this research include Z.L. Zhong, M.J. Ye, L.Y. Han, D.Q. Ye and J.J. Chen.

Studies in the Area of Oral Squamous Cell Carcinoma Reported from Department of Oral Pathology (Immunohistochemical expression of Bcl-2 in oral epithelial dysplasia and oral squamous cell carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Oral Squamous Cell Carcinoma are presented in a new report. According to news reporting originating from Uttar Pradesh, India, by NewsRx correspondents, research stated, "The B cell lymphoma-2 gene is a proto-oncogene whose protein product inhibits apoptosis. Its role is associated with keeping cells alive, but not by stimulating them to proliferation, as other proto-oncogenes do."

Our news editors obtained a quote from the research from the Department of Oral Pathology, "Increased expression of protein product of Bcl-2 gene appears in the early phase of carcinogenesis leading to apoptosis impairment and in consequence to the progression of neoplastic changes. To evaluate and compare the expression of Bcl-2 protein in oral epithelial dysplasia and oral squamous cell carcinoma (OSCC). Sixty cases of formalin-fixed paraffin-embedded archival specimens comprising of 30 cases of leukoplakia with oral epithelial dysplasia and 30 cases of OSCC were taken for immunohistochemical analysis using monoclonal antibody against anti-human Bcl-2 oncoprotein. Immunostaining for Bcl-2 protein was identified in basal and parabasal layers as granular cytoplasmic staining in oral epithelial dysplasia. In OSCC, Bcl-2 immunoreactivity was most prominent in the peripheral cells of the infiltrating tumor islands which diminished toward the center in well-differentiated and moderately differentiated OSCC, whereas stronger and more diffuse expression of Bcl-2 oncoprotein was seen in poorly differentiated OSCC. Overall positivity of 26.7% (8/30) was observed in oral epithelial dysplasia and 30% (9/30) in OSCC in this study."

According to the news editors, the research concluded: "Altered expression of Bcl-2 oncoprotein may be an early molecular event which leads to prolonged cell survival, increased chances of accumulation of genetic alterations, and subsequent increase in malignant transformation potential."

For more information on this research see: Immunohistochemical expression of Bcl-2 in oral epithelial dysplasia and oral squamous cell carcinoma. Indian Journal of Cancer, 2015;52(4):505-10.

The news editors report that additional information may be obtained by contacting S. Juneja, Dept. of Oral Pathology, ITS Centre for Dental Sciences and Research, Murad Nagar, Ghaziabad, Uttar Pradesh, India. Additional authors for this research include N.B. Chaitanya and M. Agarwal.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4103/0019-509X.178411. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Pancreatic Cancer

Studies in the Area of Pancreatic Cancer Reported from Ernst-Moritz-Arndt-University (TRAIL Promotes Tumor Growth in a Syngeneic Murine Orthotopic Pancreatic Cancer Model and Affects the Host Immune Response)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Pancreatic Cancer have been published. According to news originating from Greifswald, Germany, by NewsRx correspondents, research stated, "Tumor necrosis factor (TNF)-related apoptosis-inducing ligand (TRAIL) is currently being evaluated as a possible biological agent for cancer treatment. However, many tumor cells are resistant to TRAIL-induced apoptosis."

Our news journalists obtained a quote from the research from Ernst-Moritz-Arndt-University, "In these cases, TRAIL may activate different pathways promoting tumor growth as well as showing different interactions with the immunological tumor microenvironment. In this study, the impact of TRAIL on tumor growth and survival in a syngeneic model of TRAIL-resistant pancreatic cancer cells was investigated. Murine 6606PDA pancreatic cancer cells were injected into the pancreatic heads of TRAIL mice and their littermates. To examine a direct effect of TRAIL on tumor cells, cultures of 6606PDA were TRAIL stimulated. The TRAIL mice displayed significantly decreased tumor volumes and an enhanced overall survival in pancreatic cancer. The decreased tumor growth in TRAIL mice was accompanied by a decrease of regulatory CD4 cells within tumors. Concordantly, TRAIL treatment of wild-type mice enhanced tumor growth and increased the fraction of regulatory CD4 cells. Yet, a direct effect of TRAIL on 6606PDA cells was not detected. Thus, TRAIL can promote tumor growth in TRAIL-resistant tumor cells."

According to the news editors, the research concluded: "This may restrict possible future clinical applications of TRAIL in pancreatic cancer."

For more information on this research see: TRAIL Promotes Tumor Growth in a Syngeneic Murine Orthotopic Pancreatic Cancer Model and Affects the Host Immune Response. Pancreas, 2016;45(3):401-8. (Lippincott Williams and Wilkins - www.lww.com; Pancreas - journals.lww.com/pancreasjournal/pages/default.aspx)

The news correspondents report that additional information may be obtained from K. Beyer, From the *Departments of General, Visceral, Thoracic and Vascular Surgery and †Medicine A (Gastroenterology and Nephrology), University Medicine Greifswald, Ernst-Moritz-Arndt-University, Greifswald, Germany. Oncology - Prostate Cancer

Studies in the Area of Prostate Cancer Reported from Far Eastern Memorial Hospital (Increased Fall Risk in Patients Receiving Androgen Deprivation Therapy for Prostate Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news reporting from Taipei, Taiwan, by NewsRx journalists, research stated, "To examine the relationship between the use of androgen deprivation therapy (ADT) and the subsequent risk of falls in men with prostate cancer (PC) by employing a population-based dataset. We retrieved the study sample from the Taiwan Longitudinal Health Insurance Database 2005."

The news correspondents obtained a quote from the research from Far Eastern Memorial Hospital, "We included 886 patients with PC who had received ADT as the study group, whereas 862 patients with PC who had not received ADT served as the comparison group. We then individually tracked each study patient for a 3-year period to identify those who subsequently received a diagnosis of a fall. We performed Cox proportional hazard regressions to calculate the hazard ratio (HR) and its corresponding 95% confidence interval (CI) for a fall during the 3-year follow-up period between these 2 groups. The incidence rates of falls per 1000 person-years were 13.37 (95% CI: 9.15 similar to 18.88) and 6.44 (95% CI: 3.61 similar to 10.63), respectively, for patients with PC who received ADT and those who did not receive ADT. Furthermore, the hazard ratio for a fall during the 3-year follow-up period for patients with PC who had received ADT was 1.95 (95% CI: 1.04 similar to 3.66, P = .037) compared to those who had not received ADT after censoring sampled patients who died during the 3-year follow-up period and adjusting for age, geographical location, monthly income, urbanization level, hypertension, diabetes, hyperlipidemia, coronary heart disease, Parkinson's disease, epilepsy, stroke, and mental illness."

According to the news reporters, the research concluded: "The present findings suggest that patients with PC who had received ADT had an increased risk of falls."

For more information on this research see: Increased Fall Risk in Patients Receiving Androgen Deprivation Therapy for Prostate Cancer. *Urology*, 2016;95():145-149. *Urology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Studies in the Area of Radiation Therapy Reported from Rotterdam Eye Hospital (Malignant pleural mesothelioma with lacrimal gland metastasis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Radiation Therapy. According to news reporting out of Rotterdam, Netherlands, by NewsRx editors, research stated, "PurposeTo describe a rare clinical case of biopsy-proven metastatic mesothelioma of the lacrimal gland which responded well to chemo and radiation therapy. MethodsInterventional case report. ResultsA 55-year-old woman with an untreated malignant biopsy-proven pleural mesothelioma presented with right proptosis, diplopia and hypoglobus."

Our news journalists obtained a quote from the research from Rotterdam Eye Hospital, "Magnetic resonance imaging showed an aggressive lacrimal gland tumour with bony erosion. A biopsy concluded a diagnosis of metastatic mesothelioma of the lacrimal gland. Her lacrimal and lung tumours showed a marked regression following palliative chemo (carboplatin) and radiation therapy. ConclusionsMalignant pleural mesothelioma may metastasize to the orbit, including the lacrimal gland."

According to the news editors, the research concluded: "A combined chemo and radiation therapy may reduce the size of the metastatic and primary tumour."

Our news journalists report that additional information may be obtained by contacting H. Hanafi, Rotterdam Eye Hosp, Dept. of Oculoplast & Orbital Surg, Rotterdam, Netherlands. Additional authors for this research include R.M. Verdijk and D. Paridaens.

Studies in the Area of Radiation Therapy Reported from Yale University (Cost-effectiveness of stereotactic radiosurgery versus whole-brain radiation therapy for up to 10 brain metastases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Radiation Therapy are discussed in a new report. According to news reporting out of New Haven, Connecticut, by
NewsRx editors, research stated, "The JLGK0901 study found that stereotactic radiosurgery (SRS) is a safe and effective treatment option for treating up to 10 brain metastases. The purpose of this study is to determine the cost-effectiveness of treating up to 10 brain metastases with SRS, whole-brain radiation therapy (WBRT), or SRS and immediate WBRT (SRS+WBRT)."

Our news journalists obtained a quote from the research from Yale University, "A Markov model was developed to evaluate the cost effectiveness of SRS, WBRT, and SRS+WBRT in patients with 1 or 2-10 brain metastases. Transition probabilities were derived from the JLGK0901 study and modified according to the recurrence rates observed in the Radiation Therapy Oncology Group (RTOG) 9508 and European Organization for Research and Treatment of Cancer (EORTC) 22952-26001 studies to simulate the outcomes for patients who receive WBRT. Costs are based on 2015 Medicare reimbursements. Health state utilities were prospectively collected using the Standard Gamble method. End points included cost, quality-adjusted life years (QALYs), and incremental cost-effectiveness ratios (ICERs). The willingness-to-pay (WTP) threshold was $100,000 per QALY. One-way and probabilistic sensitivity analyses explored uncertainty with regard to the model assumptions. In patients with 1 brain metastasis, the ICERs for SRS versus WBRT, SRS versus SRS+WBRT, and SRS+WBRT versus WBRT were $117,418, $51,348, and $746,997 per QALY gained, respectively. In patients with 2-10 brain metastases, the ICERs were $123,256, $58,903, and $821,042 per QALY gained, respectively. On the sensitivity analyses, the model was sensitive to the cost of SRS and the utilities associated with stable post-SRS and post-WBRT states. In patients with 2-10 brain metastases, SRS versus WBRT becomes cost-effective if the cost of SRS is reduced by $3512. SRS versus WBRT was also cost effective at a WTP of $200,000 per QALY on the probabilistic sensitivity analysis. The most cost-effective strategy for patients with up to 10 brain metastases is SRS alone relative to SRS+WBRT."

According to the news editors, the research concluded: "SRS alone may also be cost-effective relative to WBRT alone, but this depends on WTP, the cost of SRS, and patient preferences."

For more information on this research see: Cost-effectiveness of stereotactic radiosurgery versus whole-brain radiation therapy for up to 10 brain metastases. *Journal of Neurosurgery*, 2016;125():18-25. *Journal of Neurosurgery* can be contacted at: Amer Assoc Neurological Surgeons, 5550 Meadowbrook Drive, Rolling Meadows, IL 60008, USA.

Our news journalists report that additional information may be obtained by contacting N.H. Lester-Coll, Yale University, Sch Med, Dept. of Therapeut Radiol, New Haven, CT 06510, United States. Additional authors for this research include A.P. Dosoretz, W.J. Magnuson, M.S. Laurans, V.L. Chiang and J.B. Yu.

Eye Diseases and Conditions - Refractive Errors

Studies in the Area of Refractive Errors Reported from Erasmus University Medical Center (When do myopia genes have their effect? Comparison of genetic risks between children and adults)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Eye Diseases and Conditions - Refractive Errors have been presented. According to news originating from Rotterdam, Netherlands, by NewsRx correspondents, research stated, "Previous studies have identified many genetic loci for refractive error and myopia. We aimed to investigate the effect of these loci on ocular biometry as a function of age in children, adolescents, and adults."

Our news journalists obtained a quote from the research from Erasmus University Medical Center, "The study population consisted of three age groups identified from the international CREAM consortium: 5,490 individuals aged <10 years; 5,000 aged 10-25 years; and 16,274 aged >25 years. All participants had undergone standard ophthalmic examination including measurements of axial length (AL) and corneal radius (CR). We examined the lead SNP at all 39 currently known genetic loci for refractive error identified from genome-wide association studies (GWAS), as well as a combined genetic risk score (GRS). The beta coefficient for association between SNP genotype or GRS versus AL/CR was compared across the three age groups, adjusting for age, sex, and principal components. Analyses were Bonferroni-corrected. In the age group <10 years, three loci (GJD2, CHRNG, ZIC2) were associated with AL/CR. In the age group 10-25 years, four loci (BMP2, KCNQ5, A2BP1, CACNA1D) were associated; and in adults 20 loci were associated. Association with GRS increased with age; beta = 0.0016 per risk allele (P = 2 x 10(-8)) in <10 years, 0.0033 (P = 5 x 10(-15)) in 10- to 25-year-olds, and 0.0048 (P = 1 x 10(-72)) in adults. Genes with strongest effects (LAMA2, GJD2) had an early effect that increased with age. Our results provide insights on the age span during which myopia genes exert their effect."

According to the news editors, the research concluded: "These insights form the basis for understanding the mechanisms underlying high and pathological myopia."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/gepi.21999. This DOI is a link to an online electronic document that is either free or for purchase.

Studies in the Area of Science Reported from National Research Institute (STRAP Acts as a Scaffolding Protein in Controlling the TLR2/4 Signaling Pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Science. According to news reporting originating from Gyeonggi Do, South Korea, by NewsRx correspondents, research stated, "The WD40-repeat protein serine/threonine kinase receptor-associated protein (STRAP) is involved in the regulation of several biological processes, including cell proliferation and apoptosis, in response to various stresses. Here, we show that STRAP is a new scaffold protein that functions in Toll-like receptor (TLR)-mediated immune responses."

Our news editors obtained a quote from the research from National Research Institute, "STRAP specifically binds transforming growth factor beta-activated kinase 1 (TAK1) and I.B kinase alpha (IKK alpha) along with nuclear factor-kappa B (NF-kappa B) subunit p65, leading to enhanced association between TAK1, IKK alpha, and p65, and subsequent facilitation of p65 phosphorylation and nuclear translocation. Consequently, the depletion of STRAP severely impairs interleukin-6 (IL-6), tumor necrosis factor alpha (TNF-alpha), and IL-1 beta production, whereas its overexpression causes a significant increase in the secretion of these pro-inflammatory cytokines by TLR2 or TLR4 agonist-stimulated macrophages. Notably, STRAP translocates to the nucleus and subsequently binds to NF-kappa B at later times after lipopolysaccharide (LPS) stimulation, resulting in prolonged IL-6 mRNA production. Moreover, the C-terminal region of STRAP is essential for its functional activity in facilitating IL-6 production."

According to the news editors, the research concluded: "Collectively, these observations suggest that STRAP acts as a scaffold protein that positively contributes to innate host defenses against pathogen infections."

Studies in the Area of Science Reported from University of California (ATR inhibitors as a synthetic lethal therapy for tumours deficient in ARID1A)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Science. According to news reporting from San Francisco, California, by NewsRx journalists, research stated, "Identifying genetic biomarkers of synthetic lethal drug sensitivity effects provides one approach to the development of targeted cancer therapies. Mutations in ARID1A represent one of the most common molecular alterations in human cancer, but therapeutic approaches that target these defects are not yet clinically available."

The news correspondents obtained a quote from the research from the University of California, "We demonstrate that defects in ARID1A sensitize tumour cells to clinical inhibitors of the DNA damage checkpoint kinase, ATR, both in vitro and in vivo. Mechanistically, ARID1A deficiency results in topoisomerase 2A and cell cycle defects, which cause an increased reliance on ATR checkpoint activity. In ARID1A mutant tumour cells, inhibition of ATR triggers premature mitotic entry, genomic instability and apoptosis."

According to the news reporters, the research concluded: "The data presented here provide the pre-clinical and mechanistic rationale for assessing ARID1A defects as a biomarker of single-agent ATR inhibitor response and represents a novel synthetic lethal approach to targeting tumour cells."

Our news journalists report that additional information may be obtained by contacting A. Ashworth, UCSF Helen Diller Family Comprehens Canc Center, San Francisco, CA 94158, United States. Additional authors for this research include R. Miller, H.N. Pemberton, S.E. Jones, J. Campbell, A. Konde, N. Badham, R. Rafiq, R. Brough, A. Gulati, C.J. Ryan, J. Francis, P.B. Vermulen, A.R. Reynolds, P.M. Reaper, J.R. Pollard, A. Ashworth and C.J. Lord.

& Wellness Week -- Current study results on Heart Disorders and Diseases - Tetralogy of Fallot have been published. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "Transannular patching (TAP) frequently accompanies primary repairs (PRs) in symptomatic neonates with tetralogy of Fallot (TOF). If a systemic-pulmonary shunt (SPS) facilitates the growth of the pulmonary valve annulus (PVA), patients with a marginally small PVA could benefit from a staged repair in terms of lowering the risk of TAP."

The news reporters obtained a quote from the research from the University of Ulsan, "Among 216 infants with TOF who underwent surgical intervention between January 2004 and December 2013, 29 infants underwent SPS with a subsequent repair (SPS group), whereas 187 infants received a PR (PR group). Median age and the Z-score of the PVA (PVA [Z]) at SPS were 32 days and -3.5, respectively. There was one late death and one follow-up loss after SPS, and preservation of the PVA was achieved on repair in 16 patients (16 of 29; 55%). Multiple regression analysis showed that performance of SPS was the only indicator of the increase in the PVA (Z) in the entire cohort (n=216). On mixed linear regression, the PVA (Z) increased significantly after the placement of an SPS (-3.6 + 0.2* duration in months, p=0.001), whereas the prerepair changes in the PVA (Z) were not statistically significant in the PR group (p=0.7), with a significant intergroup difference (p < 0.001). Receiver operating characteristic curve analysis showed that placement of TAP is expected when the preshunt PVA (Z) is smaller than -4.2 (area under the curve: 0.82; 95% confidence interval: 0.62 to 1.00; sensitivity, 100%; specificity, 73%). SPS facilitates outgrowth of the PVA over somatic growth in patients with TOF."

According to the news reporters, the research concluded: "However, preservation of the PVA may not be achieved on staged repair if the initial PVA is too small."

Our news correspondents report that additional information may be obtained by contacting T.J. Yun, University of Ulsan, Coll Med, Asan Med Center, Div Pediat Cardiac Surg & Pediat CardiolSongpa, Seoul, South Korea. Additional authors for this research include J.S. Baek, Y.M. Im, C.S. Park, J.J. Park and T.J. Yun.

Studies in the Area of Tuberculosis Reported from Imperial College (Hypoxia and tissue destruction in pulmonary TB)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mycobacterium Infections - Tuberculosis. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "It is unknown whether lesions in human TB are hypoxic or whether this influences disease pathology. Human TB is characterised by extensive lung destruction driven by host matrix metalloproteinases (MMPs), particularly collagenases such as matrix metalloproteinase-1 (MMP-1)."

Financial support for this research came from Medical Research Council.

Our news editors obtained a quote from the research from Imperial College, "We investigated tissue hypoxia in five patients with PET imaging using the tracer [F-18]-fluoromisonidazole ([F-18]FMISO) and by immunohistochemistry. We studied the regulation of MMP secretion in primary human cell culture model systems in normoxia, hypoxia, chemical hypoxia and by small interfering RNA (siRNA) inhibition. Results [F-18]FMISO accumulated in regions of TB consolidation and around pulmonary cavities, demonstrating for the first time severe tissue hypoxia in man. Patlak analysis of dynamic PET data showed heterogeneous levels of hypoxia within and between patients. In Mycobacterium tuberculosis (M. tb)-infected human macrophages, hypoxia (1% pO(2)) upregulated MMP-1 gene expression 170-fold, driving secretion and caseinolytic activity. Dimethylxvalyl glycine (DMOG), a small molecule inhibitor which stabilises the transcription factor hypoxia-inducible factor (HIF)-1 alpha, similarly upregulated MMP-1. Hypoxia did not affect mycobacterial replication. Hypoxia increased MMP-1 expression in primary respiratory epithelial cells via intercellular networks regulated by TB. HIF-1 alpha and NF-kappa B regulated increased MMP-1 activity in hypoxia. Furthermore, M. tb infection drove HIF-1 alpha accumulation even in normoxia. In human TB lung biopsies, epithelioid macrophages and multinucleate giant cells express HIF-1 alpha. HIF-1 alpha blockade, including by targeted siRNA, inhibited TB-driven MMP-1 gene expression and secretion."

According to the news editors, the research concluded: "Human TB lesions are severely hypoxic and M. tb drives HIF-1 alpha accumulation, synergistically increasing collagenase activity which will lead to lung destruction and cavitation."

For more information on this research see: Hypoxia and tissue destruction in pulmonary TB. Thorax, 2016;71(12):1145-1153. Thorax can be contacted at: Bmj Publishing Group, British Med Assoc House, Tavistock Square, London WC1H 9JR, England. (BMJ Publishing Group - group.bmj.com/; Thorax - thorax.bmj.com/)

The news editors report that additional information may be obtained by contacting J.S. Friedland, Imperial Coll London, Sect Infect Dis & Immun, London, United Kingdom. Studies in the Area of Type 2 Diabetes Reported from Baylor University College of Medicine (Mitochondrial Activity in Human White Adipocytes Is Regulated by the Ubiquitin Carrier Protein 9/microRNA-30a Axis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "The acquisition of beige adipocyte features by white fat cells corresponds to protection against obesity-induced metabolic diseases in humans and animal models of type 2 diabetes. In adipose tissue, expression of the F2 small ubiquitin-like modifier ligase ubiquitin carrier protein 9 (Ubc9) is positively correlated with markers of insulin resistance and corresponds with impaired browning of human white adipocytes."

Funders for this research include National Institute of Diabetes and Digestive and Kidney Diseases, National Institute of General Medical Sciences, American Heart Association, American Cancer Society, Caroline Weiss Law Foundation, Alkek Center for Molecular Discovery, Baylor College of Medicine Bridge to Independence Program, National Cancer Institute, Prostate Cancer Foundation.

The news correspondents obtained a quote from the research from the Baylor University College of Medicine, "However, the molecular regulation of Ubc9 expression in adipocytes and other cells remains unclear. In this study, we demonstrate that the mRNA and protein expression of Ubc9 are regulated by the microRNA miRNA-30a (milk-30a) in human subcutaneous adipocytes. Ubc9 and miR-30a exhibit inverse expression in adipose tissue, with miR-30a robustly elevated in brown fat. Depletion of Ubc9 by siRNA or enforced expression of a miR-30a mimic augments mitochondrial volume and respiration in human white adipocytes, reflecting features of brown fat cells. Furthermore, Ubc9 depletion induces a brown fat gene program in human subcutaneous adipocytes. Induction of the beige-selective gene program corresponds to stabilization of the PR domain-containing 16 (PRDM16) protein, an obligate transcriptional regulator of the brown/beige fat metabolic program in white adipocytes that interacts with Ubc9."

According to the news reporters, the research concluded: "Taken together, our data demonstrate a previously unappreciated molecular axis that controls browning of human white adipocytes."

Our news journalists report that additional information may be obtained by contacting S.M. Hartig, Baylor College of Medicine, Dept. of Mol & Cellular Biol, Houston, TX 77030, United States. Additional authors for this research include Y. Chen, D.A. Bader,
Vascular Diseases

Studies in the Area of Vascular Diseases Reported from Fourth Military Medical University (Adult lead exposure increases blood-retinal permeability: A risk factor for retinal vascular disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Vascular Diseases is the subject of a report. According to news reporting originating from Xi'an, People's Republic of China, by NewsRx correspondents, research stated, "Low-to-moderate level developmental and adult lead exposure produces retinal dysfunction and/or degeneration in humans and experimental animals. Although high level in vivo or in vitro lead disrupts blood-brain-barrier tight junctions and increases its permeability, the blood-retinal-barrier (BRB) has not been examined."

Financial supporters for this research include National Basic Research Program of China, National Natural Scientific Foundation of China.

Our news editors obtained a quote from the research from Fourth Military Medical University, "There were four overall goals. First, generate environmentally relevant dose-response models of short-term lead exposure in adult rats. Second, assess retinal histology and functional integrity of the BRB. Third, investigate the transmembrane proteins occludin and claudin-5 as targets mediating the increased BRB permeability. Fourth, examine the contribution of the PI3K-Akt signaling pathway as a mechanism underlying increased BRB permeability. Young adult rats were given water, 0.01% or 0.02% lead drinking solutions for six weeks. In control, 0.01% and 0.02% groups the six week mean blood [Pb] were 1, 12.5 and 19 µg/dl, respectively. We employed histology, stereology, quantitative image analysis, immunoblots and densitometry, and pharmacology techniques. Major findings were that adult lead exposure produced dose-dependent 1) decreases in outer and inner nuclear layer thickness, 2) increases in BRB permeability, 3) decreases in occludin and claudin-5 expression, 4) increases in pAkt (Ser473), but not pAkt (Thr308), expression, and 5) wortmannin partially or completely blocked the increased BRB permeability and changes in protein expression. These results indicate that lead-induced increases in PI3K-Akt signaling partially underlie the increased BRB permeability and advance our knowledge about lead-induced retinotoxicity."

According to the news editors, the research concluded: "Furthermore, they suggest that environmental and occupational lead exposures are risk factors for increased BRB permeability in diseases such as age-related macular degeneration, diabetes and stroke."

For more information on this research see: Adult lead exposure increases blood-retinal permeability: A risk factor for retinal vascular disease. Neurotoxicology, 2016;57():145-
152. *Neurotoxicology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Neurotoxicology - www.journals.elsevier.com/neurotoxicology/)

**Studies in the Area of Visceral Surgery Reported from University Hospital (Indications for embolization in a French level 1 trauma center)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Surgery - Visceral Surgery. According to news reporting out of Nimes, France, by NewsRx editors, research stated, "Abdominal trauma accounts for nearly 20% of all traumatic injuries. It often involves young patients sustaining multiple injuries, with a high associated mortality rate."

Our news journalists obtained a quote from the research from University Hospital, "Management should begin at the scene of injury and relies on a structured chain of care in order to transport the trauma patient to the appropriate hospital center. Management is multi-disciplinary, involving intensive care specialists, surgeons and radiologists. Imaging to precisely define injury is best performed with whole body dual phase computed tomography, which can also identify the source of bleeding. Non-operative management has developed considerably over the years: this includes selective embolization in case of active bleeding or vascular anomalies in stable or stabilized patients after resuscitation. Embolization has become one of the corner stones of abdominal trauma management and interventional radiologists must play an active role on the trauma team."

According to the news editors, the research concluded: "This overview details the different embolization procedures according to the involved organ and embolic agent used."

Our news journalists report that additional information may be obtained by contacting J. Frandon, CHU Nimes, F-30029 Nimes, France. Additional authors for this research include C. Arvieux and F. Thony.

Drugs and Therapies - Antifungals

Study Data from A. Farkas et al Provide New Insights into Antifungals (Comparative Evaluation of the Predictive Performances of Three Different Structural Population Pharmacokinetic Models To Predict Future Voriconazole Concentrations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antifungals. According to news originating from Bloomingdale, New Jersey, by NewsRx correspondents, research stated, "Bayesian methods for voriconazole therapeutic drug monitoring (TDM) have been reported previously, but there are only sparse reports comparing the accuracy and precision of predictions of published models. Furthermore, the comparative accuracy of linear, mixed linear and nonlinear, or entirely nonlinear models may be of high clinical relevance."

Our news journalists obtained a quote from the research, "In this study, models were coded into individually designed optimum dosing strategies (ID-ODS) with voriconazole concentration data analyzed using inverse Bayesian modeling. The data used were from two independent data sets, patients with proven or suspected invasive fungal infections (n = 57) and hematopoietic stem cell transplant recipients (n = 10). Observed voriconazole concentrations were predicted whereby for each concentration value, the data available to that point were used to predict that value. The mean prediction error (ME) and mean squared prediction error (MSE) and their 95% confidence intervals (95% CI) were calculated to measure absolute bias and precision, while Delta ME and Delta MSE and their 95% CI were used to measure relative bias and precision, respectively. A total of 519 voriconazole concentrations were analyzed using three models. MEs (95% CI) were 0.09 (-0.02, 0.22), 0.23 (0.04, 0.42), and 0.35 (0.16 to 0.54) while the MSEs (95% CI) were 2.1 (1.03, 3.17), 4.98 (0.90, 9.06), and 4.97 (-0.54 to 10.48) for the linear, mixed, and nonlinear models, respectively."

According to the news editors, the research concluded: "While simulations with the linear model were found to be slightly more accurate and similarly precise, the small difference in accuracy is likely negligible from the clinical point of view, making all three approaches appropriate for use in a voriconazole TDM program."

The news correspondents report that additional information may be obtained from A. Farkas, Optimum Dosing Strategies, Bloomingdale, NJ 07403, United States. Additional authors for this research include G. Daroczi, P. Villasurda, M. Dolton, M. Nakagaki and J.A. Roberts.

Cardiovascular Diseases and Conditions...

Study Data from A.K. Patel and Co-Authors Update Knowledge of Atherosclerosis (A Review on Atherosclerotic Biology, Wall Stiffness, Physics of Elasticity, and Its Ultrasound-Based Measurement)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Atherosclerosis are presented in a new report. According to news reporting out of Roseville, California, by NewsRx editors, research stated, "Functional and structural changes in the common carotid artery are biomarkers for cardiovascular risk. Current methods for measuring functional changes include pulse wave velocity, compliance, distensibility, strain, stress, stiffness, and elasticity derived from arterial waveforms."

Our news journalists obtained a quote from the research, "The review is focused on the ultrasound-based carotid artery elasticity and stiffness measurements covering the physics of elasticity and linking it to biological evolution of arterial stiffness. The paper also presents evolution of plaque with a focus on the pathophysiological cascade leading to arterial hardening. Using the concept of strain, and image-based elasticity, the paper then reviews the lumen diameter and carotid intima-media thickness measurements in combined temporal and spatial domains."

According to the news editors, the research concluded: "Finally, the review presents the factors which influence the understanding of atherosclerotic disease formation and cardiovascular risk including arterial stiffness, tissue morphological characteristics, and image-based elasticity measurement."

For more information on this research see: A Review on Atherosclerotic Biology, Wall Stiffness, Physics of Elasticity, and Its Ultrasound-Based Measurement. Current Atherosclerosis Reports, 2016;18(12):126-137. Current Atherosclerosis Reports can be contacted at: Current Medicine Group, 400 Market Street, Ste 700, Philadelphia, PA 19106, USA. (Springer - www.springer.com; Current Atherosclerosis Reports - www.springerlink.com/content/1523-3804/)

**Oncology - Breast Cancer**

**Study Data from Amirkabir University of Technology Update**

**Understanding of Breast Cancer (Novel alginate-stabilized doxorubicin-loaded nanodroplets for ultrasonic theranosis of breast cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting originating in Tehran, Iran, by NewsRx journalists, research stated, "Perfluorocarbon nanoemulsions are a new class of multifunctional stimuli-responsive nanocarriers which combine the properties of passive-targeted drug carriers, ultrasound imaging contrast agents, and ultrasound-responsive drug delivery systems. Doxorubicin-loaded alginate stabilized perflourohexane (PFH) nanodroplets were synthesized via nanoemulsion preparation method and their ultrasound responsivity, imaging, and therapeutic properties were studied."

The news reporters obtained a quote from the research from the Amirkabir University of Technology, "Doxorubicin was loaded into the nanodroplets (39.2 nm) with encapsulation efficiency of 92.2%. In vitro release profile of doxorubicin from nanodroplets was an apparently biphasic release process and 12.6% of drug released from nanodroplets after 24h incubation in PBS, pH approximate to 7.4. Sonication with 28 kHz therapeutic ultrasound for 10 min triggered droplet-to-bubble transition in PFH nanodroplets which resulted in the release of 85.95% of doxorubicin from nanodroplets. Microbubbles formed by acoustic vaporization of the nanodroplets underwent inertial cavitation. In the breast cancer mice models, ultrasound-mediated therapy with doxorubicin-loaded PFH nanodroplets showed excellent anti-cancer effects characterized by tumor regression. Complete tumor regression was observed for the group in which doxorubicin-loaded nanodroplets were combined with ultrasound, whereas the tumor growth inhibition of doxorubicin loaded nanodroplets was 89.6%.

According to the news reporters, the research concluded: "These multifunctional nanodroplets, with excellent therapeutic and ultrasound properties, could be promising drug delivery systems for chemotherapeutic application."

Our news correspondents report that additional information may be obtained by contacting F. Mortarzadeh, Amirkabir Univ Technol, Center Excellence, Fac Biomed Engn, Biomat Grp, Tehran, Iran. Study Data from Amrita University Update Knowledge of Cardiovascular Imaging (Isolated rheumatic severe tricuspid regurgitation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Medical Imaging - Cardiovascular Imaging. According to news reporting originating in Kerala, India, by NewsRx journalists, research stated, "Severe isolated tricuspid regurgitation (TR) is very rare, with most cases of TR being functional and secondary to pulmonary hypertension from left heart pathologies. We report an unusual case of a young Nigerian male, who presented to us with dyspnea, repeated hospital admissions for heart failure, and a childhood history of rheumatic fever."

The news reporters obtained a quote from the research from Amrita University, "Echocardiogram showed massively dilated right atrium and ventricle, noncoaptation of thickened tricuspid valve with torrential free tricuspid regurgitation. Other valves were normal. Cardiac MRI showed normal right ventricular function and viability."

According to the news reporters, the research concluded: "Patient underwent tricuspid valve replacement with 35-mm St. Jude valve."

Our news correspondents report that additional information may be obtained by contacting V. Vijan, Amrita Vishwa Vidyapeetham Univ, Dept. of Cardiol, Amrita Inst Med Sci, Kochi, Kerala, India. Additional authors for this research include V. Vijan, M.A. Prabhu, R. Thachathodiyl and R.C. Nair.

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
correspondents, research stated, "Increased body mass index (BMI) is a risk factor for heart failure, but evidence regarding BMI in acute heart failure (AHF) remains inconclusive. We sought to compare the clinical profile, treatment and in-hospital outcome across BMI categories in a large international AHF cohort."

Financial support for this research came from European Society of Cardiology and European Union.

Our news journalists obtained a quote from the research from Attikon University Hospital, "The Acute Heart Failure Global Survey of Standard Treatment (ALARM-HF) is a retrospective survey on 4953 patients admitted for AHF from nine countries in Europe, Latin America, and Australia. Patients with unavailable BMI data or BMI <18.5 kg/m(2) were excluded. Clinical data and in-hospital mortality were compared among the following BMI categories: 18.5-24.9 kg/m(2) (normal weight), 25-29.9 kg/m(2) (overweight) and (>=)30 kg/m (2) (obese). Overweight/obese patients represented 75.7% of patients and had worse New York Heart Association class (p <0.001) and higher admission systolic blood pressure (p <0.001). The prevalence of comorbidities increased in parallel with BMI and included arterial hypertension, diabetes mellitus, dyslipidaemia (all p<0.001), chronic obstructive pulmonary disease (p=0.041) and chronic kidney disease (p=0.056). Use of guideline-recommended medications also increased in parallel with BMI (angiotensin converting enzyme inhibitors/angiotensin II receptor blockers, p<0.001; b-blockers p<0.001; mineralocorticoid receptors antagonist, p=0.002). In-hospital mortality had a U-shaped relationship with BMI, with overweight patients having significantly lower rate (log-rank p=0.027); this relationship vanished after adjustment for confounders. Overweight/obese patients represented the vast majority of AHF cases, had a higher prevalence of non-cardiovascular comorbidities and were more likely to receive guideline-recommended medications."

According to the news editors, the research concluded: "The U-shaped relationship between in-hospital mortality and BMI may be explained by differences in clinical profile and treatment and not by an effect of body composition per se."

The news correspondents report that additional information may be obtained from J. Parissis, Heart Failure Unit, Dept. of Cardiology, Attikon University Hospital, J Rimini Street, 12462, Athens, Greece. Additional authors for this research include D. Farmakis, N. Kadoglou, I. Therapeutics

Study Data from Augustana College Update Understanding of Therapeutics [Tissue-specific variation in nonsense mutant transcript level and drug-induced read-through efficiency in the Cln1(R151X) mouse model of INCL]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Therapeutics is now available. According to news reporting originating from Sioux Falls, South Dakota, by NewsRx correspondents, research stated, "About 10% of inherited diseases are caused by nonsense mutations [Trends Mol Med 18 (2012) 688], and nonsense suppression drug therapy promoting translation through premature stop codons is an emerging therapeutic approach. Infantile neuronal ceroid lipofuscinosis (INCL), a childhood neurodegenerative disease, results from mutations in the CLN1 gene encoding the lysosomal enzyme, palmitoyl-protein thioesterase 1 (PPT1) [Biochim Biophys Acta 1832 (2013) 1806, Hum Mutat (2012) 63, Biochim Biophys Acta 1832 (2013) 1881]."

Funders for this research include Hayden's Hope, Beat Batten Foundation, Sanford Health, National Institutes of Health.

Our news editors obtained a quote from the research from Augustana College, "The nonsense mutation p.R151X is the most common disease-causing CLN1 mutation Hum Mutat (2012) 63. In the novel Cln1(R151X) mouse model of INCL, we found large, tissue-specific variations in Cln1(R151X) mRNA level and PPT1 residual enzyme activity. These tissue-specific differences strongly influenced the read-through efficiency of ataluren (PTC124), a well-known nonsense suppression drug. A two-day treatment with ataluren (10 mg/kg) increased PPT1 enzyme activity in the liver and muscle, but not in any other tissue examined."

According to the news editors, the research concluded: "Our study identifies a new challenge/hurdle for read-through drug therapy: variable efficiency of read-through therapy in the different tissues/organs because of tissue-specific variations in nonsense mutant transcript levels."

For more information on this research see: Tissue-specific variation in nonsense mutant transcript level and drug-induced read-through efficiency in the Cln1(R151X) mouse model of INCL. Heart Disorders and Diseases - Heart Attack

Study Data from B. DeVoe and Co-Authors Update Knowledge of Heart Attack (Correlation of the predictive ability of early warning metrics and mortality for cardiac arrest patients receiving in-hospital Advanced Cardiovascular Life Support)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news originating from Hempstead, New York, by NewsRx correspondents, research stated, "The Modified Early Warning Score (MEWS) helps identify patients experiencing a decline in physiological parameters that indicate risk for cardiac arrest (CA). To assess the association between MEWS values and patient survival following in-hospital CA." Our news journalists obtained a quote from the research, "Retrospective cohort study of patients who experienced in-hospital CA. The relationship between CA survival and MEWS values as well as other risk factors such as age, gender and type of electrographic cardiac rhythms was analyzed using logistic regression. Survival rate to hospital discharge was 21%. Strong predictors for survival were MEWS values at hospital admission (p < .002), younger age (p < .005), ventricular fibrillation (p < .0001), and ventricular tachycardia (p < .0001). Gender and MEWS 4 hours prior to CA were not significantly associated with survival. Survival following CA was significantly associated with MEWS at hospital admission but not 4 hours prior to CA."

According to the news editors, the research concluded: "The type of cardiac rhythm and age were also predictive of survival."

The news correspondents report that additional information may be obtained from P. DiMarzio, Hofstra Northwell Hlth Sch Med, Dept. of Occupat Med Epidemiol & Prevent, Hempstead, NY, United States. Drug Administration Routes

Study Data from Beijing University Provide New Insights into Drug Administration Routes (Simultaneous Analysis of Quercetin and Naringenin in Rat Plasma by Liquid Chromatography-Tandem Mass Spectrometry: Application to a Pharmacokinetic Study ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drug Administration Routes is now available. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "A rapid and specific LC-MS-MS method has been developed for simultaneous analysis of quercetin and naringenin in rat plasma. The method was applied to the pharmacokinetics studies of quercetin and naringenin after oral administration of Pollen Typhae extract."

The news correspondents obtained a quote from the research from Beijing University, "The samples were prepared by the protein precipitation method. The analysis was carried out on an ACQUITY UPLC™ BEH C18 column with gradient elution using mobile phase, which included acetonitrile and water (containing 0.1% formic acid). The flow rate was 0.4 mL/min. All analytes including internal standard (IS) were monitored by selected reaction monitoring with an electrospray ionization source. Linear responses were obtained for quercetin ranging from 0.5 to 100 ng/mL and naringenin ranging from 5 to 1000 ng/mL. The intra-and interday precisions (RSD) were less than 10.78 and 11.20%. The extraction recovery of the analytes was acceptable. Stability studies showed that quercetin and naringenin were stable in the preparation and analytical process."

According to the news reporters, the research concluded: "The validated method was successfully used to determine the concentration-time profiles of quercetin and naringenin."

Our news journalists report that additional information may be obtained by contacting J. Ni, Beijing Univ Chinese Med, Sch Chinese Mat Med, Beijing 100102, People's Republic of China. Additional authors for this research include S.L. Cao, L.J. Feng, X.B. Yin, W.P. Wang, X. Zhang and J. Ni.

Keywords for this news article include: Beijing, People's Republic of China, Asia, Drug Administration Routes, Oral Administration, Pharmacokinetics, Pharmaceuticals, Beijing University.

Liver Diseases and Conditions - Hepatitis C Virus

Study Data from Binzhou Medical College Update Knowledge of Hepatitis C Virus (Correlation of interferon-lambda 4 ss469415590 with the hepatitis C virus treatment response and its comparison with interleukin 28b polymorphisms in predicting a ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Liver Diseases and Conditions - Hepatitis C Virus is the subject of a report. According to news reporting originating from Shandong, People's Republic of China, by NewsRx correspondents, research stated, "Interferon-lambda 4 (IFNL4) ss469415590 is a newly discovered polymorphism that could predict the treatment response in hepatitis C virus (HCV)-infected patients. This meta-analysis was performed in order to clarify its specific effect on the treatment response and to compare it with interleukin 28b (IL28B)."

Our news editors obtained a quote from the research from Binzhou Medical College, "The commonly used literature databases were searched. Meta-analyses were performed using fixed/random-effects models using Stata 12.0. The sustained virological response (SVR) rate was summarized using R software. Publication bias was examined through Egger's test. A total of seven studies were finally included in this meta-analysis. IFNL4 ss469415590 was demonstrated to be associated with SVR (odds ratio (OR) 3.83, 95% confidence interval (CI) 3.22-4.56, p< 0.001). Asians had a higher likelihood of achieving SVR than Caucasians (OR = 7.36 vs. 3.54). When stratifying all the patients according to HCV genotype, a significant association was observed in HCV genotype 1 patients (OR 4.5, 95% CI 2.91-6.95, p< 0.001). In HCV genotype 2/3 patients, the favorable TT/TT genotype patients tended to have a statistically higher SVR rate than the non-TT/TT genotype patients (84.4% vs. 78.3%, p = 0.058). Compared with IL28B rs12979860 (OR 3.45) and rs8099917 (OR 3.50), ss469415590 TT/TT genotype patients showed a slightly higher probability of achieving a SVR (OR 3.61 calculated from studies investigating both IFNL4 and rs12979860; OR 4.86 for studies investigating both IFNL4 and rs8099917). Furthermore, ss469415590 showed a slightly higher predictive value than rs12979860 using the diagnostic test tool (area under the curve = 0.71 vs. 0.70). IFNL4 was also correlated with rapid virological response (RVR) (OR 4.35, 95% CI 1.43-13.20, p = 0.01), viral clearance (OR 0.31, 95% CI 0.24-0.39, p< 0.001), and HCV susceptibility (OR 0.76, 95% CI 0.65-0.89, p = 0.001). IFNL4 ss469415590 is significantly associated with SVR in HCV genotype 1 patients, irrespective of race; there is a tendency towards an association in HCV genotype 2/3 patients."

According to the news editors, the research concluded: "Comparable to IL28B, IFNL4 is correlated with natural viral clearance and HCV susceptibility, additionally IFNL4 ss469415590 has a slightly higher predictive performance over IL28B polymorphisms in regard to SVR."

The news editors report that additional information may be obtained by contacting Y.H. Li, Binzhou Med Univ Hosp, Dept. of Infect Dis, Binzhou 256603, Shandong, People's Republic of China. Additional authors for this research include L.H. Yang, K.H. Sha, T.G. Liu and L.G. Zhang.

Immune System Diseases and Conditions - HIV/AIDS

Study Data from C. Mummert et al Provide New Insights into HIV/AIDS (T-cell receptor transfer for boosting HIV-1-specific T-cell immunity in HIV-1-infected patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - HIV/AIDS. According to news originating from Bochum, Germany, by NewsRx correspondents, research stated, "Strategies to cure HIV-1 infection require the eradication of viral reservoirs. An innovative approach for boosting the cytotoxic T-lymphocyte response is the transfer of T-cell receptors (TCRs)."

Our news journalists obtained a quote from the research, "Previously, we have shown that electroporation of TCR-encoding mRNA is able to reprogram CD8(+) T cells derived from healthy donors. So far, it is unknown whether the transfer of HIV-1-specific TCRs is capable to reprogram CD8(+) T cells of HIV-1-infected patients. To assess the efficiency of TCR-transfer by mRNA electroporation and the functionality of reprogramed T cells in HIV-1-infected patients, we performed an in-vitro analysis of TCR-transfer into T cells from HIV-1-infected patients in various stages of disease and from healthy controls. Peripheral blood mononuclear cells from 16 HIV-1-infected patients (nine HLA-A*02-positive, seven HLA-A*02-negative) and from five healthy controls were electroporated with mRNA-constructs encoding TCRs specific for the HLA-A*02/HIV-1gag p17 epitope SLYNTVATL (SL9). Functionality of the TCRs was measured by gamma IFN-ELISpot assays. SL9/TCR transfection into peripheral blood mononuclear cells from both HLA-A*02-positive and HLA-A*02-negative HIV-1-infected patients and from healthy blood donors reprogramed T cells for recognition of SL9-presenting HLA-A*02-positive cells in gIFN-ELISpot assays. SL9/TCR-transfer into T cells from an immunodeficient AIDS patient could induce recognition of SL9-expressing target cells only after reversion of T-cell dysfunction by antiretroviral therapy. The transfer of HIV-1-p17-specific TCRs into T cells is functional both in HIV-1-infected patients as well as in healthy blood donors."

According to the news editors, the research concluded: "TCR-transfer is a promising method to boost the immune system against HIV-1."
For more information on this research see: T-cell receptor transfer for boosting HIV-1-specific T-cell immunity in HIV-1-infected patients. *Aids*, 2016;30(14):2149-2158. *Aids* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Aids - journals.lww.com/aidsonline/pages/default.aspx)

**Blood Pressure**

**Study Data from CHUM Provide New Insights into Blood Pressure (The role of GRIP1 and ephrin B3 in blood pressure control and vascular smooth muscle cell contractility)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Blood Pressure have been presented. According to news reporting originating from Montreal, Canada, by NewsRx correspondents, research stated, "Several erythropoietin-producing hepatocellular receptor B family (EPHB) and their ligands, ephrinBs (EFNBs), are involved in blood pressure regulation in animal models. We selected 528 single nucleotide polymorphisms (SNPs) within the genes of EPHB6, EFNB2, EFNB3 and GRIP1 in the EPH/EFN signalling system to query the International Blood Pressure Consortium dataset."

Our news editors obtained a quote from the research from CHUM, "A SNP within the glutamate receptor interacting protein 1 (GRIP1) gene presented a p-value of 0.000389, approaching the critical p-value of 0.000302, for association with diastolic blood pressure of 60,396 individuals. According to echocardiography, we found that Efnb3 gene knockout mice showed enhanced constriction in the carotid arteries. In vitro studies revealed that in mouse vascular smooth muscle cells, siRNA knockdown of GRIP1, which is in the EFNB3 reverse signalling pathway, resulted in increased contractility of these cells."

According to the news editors, the research concluded: "These data suggest that molecules in the EPHB/EFNB signalling pathways, specifically EFNB3 and GRIP1, are involved blood pressure regulation."

The news editors report that additional information may be obtained by contacting J.P. Wu, CHUM, Serv Nephrol, Montreal, PQ H2X 0A9, Canada. Additional authors for this

Keywords for this news article include: Montreal, Quebec, Canada, North and Central America, Intercellular Signaling Peptides and Proteins, Blood Pressure, Muscle Cells, Ephrin-B3, Ephrins, CHUM.

Oncology - Bladder Cancer

**Study Data from Cancer Center Update Understanding of Bladder Cancer (Upregulated expression of BCL2, MCM7, and CCNE1 indicate cisplatin-resistance in the set of two human bladder cancer cell lines: T24 cisplatin sensitive and T24R2 cisplatin ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Bladder Cancer are discussed in a new report. According to news reporting originating in Goyang, South Korea, by NewsRx journalists, research stated, "The mechanism of resistance to cisplatin during treatment of bladder cancer (BC) has been a subject of intense investigation in clinical research. This study aims to identify candidate genes associated with resistance to cisplatin, in order to understand the resistance mechanism of BC cells to the drug, by combining the use of microarray profiling, quantitative reverse transcription-polymerase chain reaction (RT-PCR), and Western blot analyses."

Financial support for this research came from National Research Foundation of Korea.

The news reporters obtained a quote from the research from Cancer Center, "The cisplatin sensitive human BC cell line (T24) and the cisplatin resistant BC cell line, T24R2, were used for microarray analysis to determine the differential expression of genes that are significant in cisplatin resistance. Candidate upregulated genes belonging to three well-known cancer-related KEGG (Kyoto Encyclopedia of Genes and Genomes) pathways (p53 tumor suppressor, apoptosis, and cell cycle) were selected from the microarray data. These candidate genes, differentially expressed in T24 and T24R2, were then confirmed by quantitative RT-PCR and western blot. A fold change (≥2) with a p-value <0.05 was considered significant. A total of 18 significantly upregulated genes were detected in the three selected cancer-related pathways in both microarray and RT-PCR analyses. These genes were PRKAR2A, PRKAR2B, CYCS, BCL2, BIRC3, DFFB, CASP6, CDK6, CCNE1, STEAP3, MCM7, ORC2, ORC5, ANAPC1, and ANAPC7, CDC7, CDC27, and SKP1. Western blot analyses also confirmed the upregulation of BCL2, MCM7, and CCNE1 at the protein level, indicating their crucial association with cisplatin resistance."

According to the news reporters, the research concluded: "The BCL2, MCM7, and CCNE1 genes might play distinctive roles in cisplatin resistance in BC."

Our news correspondents report that additional information may be obtained by
contacting S.H. Kim, Dept. of Urology, National Cancer Center, Goyang, South Korea. Additional authors for this research include J.N. Ho, H. Jin, S.C. Lee, S.E. Lee, S.K. Hong, J.W. Lee, E.S. Lee and S.S Byun.

Cardiovascular Diseases and Conditions --

Study Data from Capital Medical University Provide New Insights into Takayasu’s Arteritis (IL-9-producing Th9 cells may participate in pathogenesis of Takayasu’s arteritis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Takayasu's Arteritis are discussed in a new report. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Takayasu's arteritis (TAK) is a type of large vessel vasculitis which involves the aorta and its major branches. Interleukin (IL)-9 or IL-9-producing Th9 cells were found to be involved in pathogenesis of autoimmune arteritis such as giant cell arteritis, but IL-9 or Th9 cells in TAK were not well known."

Our news editors obtained a quote from the research from Capital Medical University, "Here, this study aims to analyze the levels of serum IL-9 and their major source Th9 cells in TAK. With the help of cytometric bead array (CBA), a total of 21 patients with TAK were examined for serum levels of cytokines IL-4, IL-6, IL-8, IL-17, IL-10, TNF-alpha, IFN-gamma, and IL-9. Flow cytometry techniques were used to examine the frequencies of Th9 cells from peripheral blood mononuclear cells (PBMCs) for 11 patients with active TAK and 10 healthy controls. Higher serum levels of serum IL-6 (P < 0.05), TNF-alpha (P < 0.05), and IL-9 level (P < 0.05) were observed in TAK patients compared to those of healthy controls. Higher frequencies of CD4(+) IL-9(+) T cells and CD4(+) PU.1(+) T cells in PBMCs and IL-9(+) PU.1 (+) T cells in CD4(+) T cells were observed in active TAK patients than those in healthy controls (all P< 0.01). The levels of IL-9 had a positive correlation with ESR (r = 0.975, P = 0.015) in these cases."

According to the news editors, the research concluded: "Our data suggested that Th9 cells and IL-9 could possibly be involved in the pathogenesis of TAK."

For more information on this research see: IL-9-producing Th9 cells may participate in pathogenesis of Takayasu's arteritis. Clinical Rheumatology, 2016;35(12):3031-3036. Clinical Rheumatology can be contacted at: Springer London Ltd, 236 Grays Inn Rd, 6TH Floor, London WC1X 8HL, England. (Springer - www.springer.com; Clinical Rheumatology - www.springerlink.com/content/0770-3198/)

The news editors report that additional information may be obtained by contacting T.

Cardiovascular Diseases and Conditions - Aneurysm

Study Data from Capital Medical University Update Knowledge of Aneurysm (Effect of hemodynamics on outcome of subtotally occluded paraclinoid aneurysms after stent-assisted coil embolization)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Aneurysm. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Endovascular treatment of paraclinoid aneurysms is preferred in clinical practice. Flow alterations caused by stents and coils may affect treatment outcome."

Our news editors obtained a quote from the research from Capital Medical University, "To assess hemodynamic changes following stent-assisted coil embolization (SACE) in subtotally embolized paraclinoid aneurysms with residual necks that were predisposed to recanalization. We studied 27 paraclinoid aneurysms (seven recanalized and 20 stable) treated with coils and Enterprise stents. Computational fluid dynamic simulations were performed on patient-specific aneurysm geometries using virtual stenting and porous media technology. After stent placement in 27 cases, aneurysm flow velocity decreased significantly, the reduction gradually increasing from the neck plane (11.9%), to the residual neck (12.3%), to the aneurysm dome (16.3%). Subsequent coil embolization was performed after stent placement and the hemodynamic factors decreased further and significantly at all aneurysm regions except the neck plane. In a comparison of recanalized and stable cases, univariate analysis showed no significant differences in any parameter before treatment. After stent-assisted coiling, only the reduction in area-averaged velocity at the neck plane differed significantly between recanalized (8.1%) and stable cases (20.5%) (p=0.016). Aneurysm flow velocity can be significantly decreased by stent placement and coil embolization. However, hemodynamics at the aneurysm neck plane is less sensitive to coils."

According to the news editors, the research concluded: "Significant reduction in flow velocity at the neck plane may be an important factor in preventing recanalization of paraclinoid aneurysms after subtotal SACE."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1136/neurintsurg-2015-012050. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Liver Cancer

Study Data from Capital Medical University Update Knowledge of Liver Cancer (Cytokine levels contribute to the pathogenesis of minimal hepatic encephalopathy in patients with hepatocellular carcinoma via STAT3 activation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Liver Cancer are presented in a new report. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Hepatocellular carcinoma (HCC) patients were grouped according to the degree of encephalopathy, with healthy volunteers as controls. We investigated clinical presentation, protein and mRNA expression of 14 cytokines, and activation of six STAT proteins, the downstream signaling mediators."

The news correspondents obtained a quote from the research from Capital Medical University, "Levels of all 14 cytokines were significantly elevated in HCC patients with clinical hepatic encephalopathy. Statistical analysis showed that levels of IL-1b, IL-6, IFNg, IL-17a, IFNl2 and IFNl3 were correlated with minimal hepatic encephalopathy (MHE). Multivariate regression analysis identified serum IL-6, IFNl3 and IL-17a as independent risk factors for MHE. Increased mRNA levels of IL-6 and IFNg were associated with MHE. Among the STAT proteins examined, only STAT3 was elevated in MHE. Treatment with a STAT3 inhibitor protected neurons from cytokine-induced apoptosis in vitro."

According to the news reporters, the research concluded: "This study identified potential biomarkers for MHE in HCC. The cytokines investigated may induce neural apoptosis via STAT3 in the pathogenesis of MHE in HCC."

For more information on this research see: Cytokine levels contribute to the pathogenesis of minimal hepatic encephalopathy in patients with hepatocellular carcinoma via STAT3 activation. Scientific Reports, 2016;6():18528. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting H. Wu, Center for Infectious Diseases, Beijing You'an Hospital, Capital Medical University, Beijing 100069, People's Republic of China. Additional authors for this research include N. Li, R. Jin, Q. Meng, P. Chen, G. Zhao, R. Wang, L. Li and W. Li.

The direct object identifier (DOI) for that additional information is:
Study Data from Center for Research and Advanced Studies of the National Polytechnic Institute (CINVESTAV) Provide New Insights into Guanidines (Pharmacological analysis of the cardiac sympatho-inhibitory actions of moxonidine and agmatine in ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Guanidines. According to news reporting out of Mexico City, Mexico, by NewsRx editors, research stated, "This study shows that in spontaneously hypertensive rats (SHR) of 14-weeks-old, the sympathetically induced, but not noradrenaline-induced tachycardic response are higher than age-matched Wistar normotensive rats. Furthermore, in SHR the sympathetically-induced tachycardic response was: (1) unaffected by moxonidine (3 μg/kg min); (2) partially inhibited by B-HT 933 (30 μg/kg min), both at the lowest doses; and (3) completely inhibited by the highest doses of B-HT 933 (100 μg/kg min), moxonidine (10 μg/kg min) or agmatine (1000 and 3000 μg/kg min) while the noradrenaline-induced tachycardic responses remained unaffected by the above compounds, except by 3000 μg/kg min agmatine."

Financial support for this research came from Conacyt.

Our news journalists obtained a quote from the research from the Center for Research and Advanced Studies of the National Polytechnic Institute (CINVESTAV), "In SHR, 300 μg/kg rauwolscine failed to block the sympatho-inhibition to 100 μg/kg min B-HT 933 or 10 μg/kg min moxonidine, but 1000 μg/kg rauwolscine abolished, partially antagonized, and did not modify the sympatho-inhibition to the highest doses of B-HT 933, moxonidine, and agmatine, respectively, 3000 μg/kg AGN 192403 or 300 μg/kg BU224 given alone had no effect in the moxonidine- or agmatine-induced sympatho-inhibition, and the combination rauwolscine plus AGN 192403 but not plus BU224, abolished the sympatho-inhibition to the highest doses of moxonidine and agmatine."

According to the news editors, the research concluded: "The sympathetically-induced tachycardic responses in SHR are inhibited by moxonidine and agmatine. The inhibition of moxonidine is mainly mediated by prejunctional alpha(2)-adrenoceptors and to a lesser extent by I-1-imidazoline receptors, while the inhibition of agmatine is mediated by prejunctional alpha(2)-adrenoceptors and I-1-imidazoline receptors at the same extent. Notwithstanding, the inhibitory function of alpha(2)-adrenoceptors seems to be altered in SHR compared with Wistar normotensive rats."

For more information on this research see: Pharmacological analysis of the cardiac sympatho-inhibitory actions of moxonidine and agmatine in pithed spontaneously hypertensive rats. European Journal of Pharmacology, 2016;791():25-36. European Journal of...

Cell Proliferation

Study Data from Central Hospital Update Understanding of Cell Proliferation (Long non-coding RNA MALAT1 is up-regulated in ovarian cancer tissue and promotes SK-OV-3 cell proliferation and invasion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cell Proliferation. According to news reporting from Shandong, People's Republic of China, by NewsRx journalists, research stated, "Ovarian cancer is a gynecological malignancy worldwide. Long non-coding RNAs (lncRNAs) research is an emerging area in cancer studies, but little is known about lncRNA metastasis associated lung adenocarcinoma transcript 1 (MALAT1) in ovarian cancer."

The news correspondents obtained a quote from the research from Central Hospital, "This study aims to investigate expression and roles of MALAT1 in ovarian cancer. MALAT1 level was detected in 20 ovarian cancer patients. MALAT1 expression was promoted by transforming growth factor beta 1 (TGF beta 1) treatment and inhibited by siRNA transfection in human ovarian cancer cell line SK-OV-3, after which changes in cell viability, proliferation, migration and invasion were analyzed by MTT, colony formation and Transwell assays. Protein levels of mitogen-activated protein kinase factors, including MAPK kinase 1 (MEK1), extracellular signal-regulated kinase (ERK1), p38 and c-Jun N-terminal kinase 1 (JNK1), were detected by western blot. MALAT1 was significantly up-regulated in ovarian cancer tissues compared to adjacent normal tissues (P < 0.01), and its expression was correlated to tumor size (r(2) = 0.7770, P< 0.0001) and metastasis. TGF beta 1 and siRNA successfully altered MALAT1 levels in SK-OV-3 cells. Knockdown of MALAT1 suppressed SK-OV-3 cell viability, proliferation, migration and invasion (P < 0.05), and inhibited phosphorylation of MEK1, ERK1, p38 and JNK1, which suggested that MALAT1 promoted ovarian cancer cell proliferation, migration and invasion, and that MAPK pathways might be one of the regulatory mechanisms of MALAT1."

According to the news reporters, the research concluded: "This study reveals that MALAT1 is a potential biomarker for tumor growth and metastasis, as well as a promising therapeutic target in ovarian cancer, facilitating further ovarian cancer research."

For more information on this research see: Long non-coding RNA MALAT1 is up-

Liver Diseases and Conditions - Hepatomas

Study Data from Changchun Institute of Applied Chemistry Update Understanding of Hepatomas (Self-Targeted Polysaccharide Prodrug Suppresses Orthotopic Hepatoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Liver Diseases and Conditions - Hepatomas. According to news reporting originating from Changchun, People's Republic of China, by NewsRx correspondents, research stated, "Self-targetability is an emerging targeting strategy for polymer nanocarriers with facile preparation and high targeting efficiency."

Financial supporters for this research include National Cancer Institute, National Natural Science Foundation of China.

Our news editors obtained a quote from the research from the Changchun Institute of Applied Chemistry, "An acid-sensitive dextran doxorubicin prodrug (Dex-g-DOX) has been synthesized and used as a self-targeted drug delivery system for the treatment of orthotopic hepatoma. The polysaccharide prodrug exhibits ultraspecific accumulation in cancerous liver tissue, acid-sensitive DOX release within cells, and high antitumor efficacy in vitro and in vivo."

According to the news editors, the research concluded: "Therefore, Dex-g-DOX demonstrates great potential for chemotherapy of orthotopic hepatoma."

For more information on this research see: Self-Targeted Polysaccharide Prodrug Suppresses Orthotopic Hepatoma. Molecular Pharmaceutics, 2016;13(12):4231-4235. Drugs and Therapies - Antiretrovirals

Study Data from Chiang Mai University Update Knowledge of Antiretrovirals (Therapeutic Drug Monitoring of Lopinavir in HIV-Infected Children on Second-Line Antiretroviral Therapy in Asia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antiretrovirals have been published. According to news reporting originating from Chiang Mai, Thailand, by NewsRx correspondents, research stated, "Failure rates of second-line boosted protease inhibitor antiretroviral therapy regimens in children rise over time. Therapeutic drug monitoring can contribute to assessments of adherence."

Our news editors obtained a quote from the research from Chiang Mai University, "The authors assessed the performance characteristics of the US DHHS-recommended lopinavir (LPV) concentration of 1.0 mg/L for predicting virologic failure (VF) and intermediate-to high-level LPV resistance in Asian children. LPV concentration, HIV RNA level, and adherence data from study participants in Thailand, Vietnam, and Indonesia receiving second-line LPV-based ART and followed for >= 24 weeks were analyzed. A total of 223 children at a median age of 10.4 (interquartile range, 7.9-13.4) years were enrolled, and 61% of them were male. Their mean CD4 was 842 +/- 438 cells per cubic millimeter, and the median LPV duration was 2.5 (interquartile range, 1.3-4.2) years. Five of 84 (6%) and 18 of 139 (13%) children had LPV trough and random concentrations,1.0 mg/L at study week 24. Using either of these trough or random LPV concentrations, a cutoff at 1.0 mg/L gave an area under the receiver operating characteristics curve of 0.69 in predicting VF with sensitivity of 44% (95% CI 23-66) and specificity of 94% (95% CI 89-97). Seven of 21 with VF and resistance results available had >= 1 major protease inhibitor mutation. Multivariate logistic regression found LPV concentrations,1.0 mg/L (odds ratio, 6.47; 95% CI 2.15-19.50, P = 0.001) and CD4 <= 20% (odds ratio, 2.83; 95% CI 1.01-7.89, P = 0.05) were independently associated with HIV RNA > 1000 copies per milliliter. No factors predicted major LPV resistance mutations."

According to the news editors, the research concluded: "The authors support that the DHHS target LPV concentration of <1.0 mg/L is predictive of VF, but not of the presence of major LPV mutations."

For more information on this research see: Therapeutic Drug Monitoring of Lopinavir in HIV-Infected Children on Second-Line Antiretroviral Therapy in Asia. Therapeutic Drug Monitoring, 2016;38(6):791-795. Therapeutic Drug Monitoring can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Hemophilia

Study Data from Children's Hospital Provide New Insights into Hemophilia (National needs assessment of patients treated at the United States Federally-Funded Hemophilia Treatment Centers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hemophilia is now available. According to news reporting originating in Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "The National Hemophilia Program Coordinating Center, with the U.S. Regional Hemophilia Network conducted a national needs assessment of U.S."

Financial support for this research came from Health Resources and Services Administration.

The news reporters obtained a quote from the research from Children's Hospital, "Hemophilia Treatment Center (HTC) patients. The objectives were to determine: (i) To what extent do patients report that they receive needed services and education; (ii) How well do the services provided meet their needs; and (iii) What are the patients' perspectives about their care. A survey was mailed to active patients of 129 HTCs. Respondents completed the anonymous surveys on line or returned them by mail. Questions focused on management and information, access and barriers to care, coping, resources, and transition. Of 24 308 questionnaires mailed, 4004 (16.5%) were returned. Most respondents reported very few gaps in needed services or information and reported that services and information met their needs. Over 90% agreed or strongly agreed that care was patient-centred and rated HTC care as important or very important. Identified gaps included dietary advice, genetic testing, information on ageing, sexual health and basic needs resources. Minority respondents reported more barriers. This survey is the largest assessment of the HTC population. Respondents reported that the services and information provided by the HTCs met their needs. Quality improvement opportunities include transition and services related to ageing and sexual health. Further investigation of barriers to care for minorities is underway."

According to the news reporters, the research concluded: "Results will help develop national priorities to better serve all patients in the US."

Our news correspondents report that additional information may be obtained by
contacting R.B. Butler, The Children's Hospital of Philadelphia Hemostasis and Thrombosis Center, Philadelphia, PA, United States. Additional authors for this research include A. Cheadle, D.J. Aschman, B. Riske, S. Senter, K.M. McLaughlin, G. Young, S. Ahuja and A.D Forsberg.

Pharmacology

Study Data from China Pharmaceutical University Provide New Insights into Pharmacology (Overview of Oroxylin A: A Promising Flavonoid Compound)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pharmacology. According to news reporting originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Oroxylin A is one of the main active components extracted from Scutellariae radix. It has been proved that oroxylin A possesses a broad spectrum of pharmacological functions, including anti-cancer, antiinflammation, neuroprotective, anti-coagulation and so on."

Our news editors obtained a quote from the research from China Pharmaceutical University, "The pharmacological activity of oroxylin A has been studied in vitro and on animal models, which reflected its promising potency in disease treatment. This review aims to recapitulate the pharmacological function and the molecular mechanisms of oroxylin A, as well as its sources, extraction, synthesis and toxicity study."

According to the news editors, the research concluded: "These data confirmed the therapeutic potential of oroxylin A and provided reference for further development."

The news editors report that additional information may be obtained by contacting Q.L. Guo, China Pharmaceutical University, Jiangsu Key Lab Carcinogenesis & Intervent, State Key Lab Nat Med, Jiangsu Key Lab Drug Design & Optimizat, Nanjing 210009, Jiangsu, People's Republic of China. Study Data from Chulalongkorn University Update Knowledge of Chronic Hepatitis B Virus (Association of interferon-gamma inducible protein 10 polymorphism with treatment response to pegylated interferon in HBeAg-positive chronic hepatitis B)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Liver Diseases and Conditions - Chronic Hepatitis B Virus is now available. According to news reporting originating in Bangkok, Thailand, by NewsRx journalists, research stated, "Interferon-gamma inducible protein 10 (IP-10) plays an important role in the clinical outcome of chronic hepatitis B (CHB). This study aimed to investigate the association between single nucleotide polymorphisms (SNPs) G-201A of the IP-10 gene and treatment response to pegylated interferon (PEG-IFN) in patients with hepatitis B e antigen (HBeAg)-positive CHB."

The news reporters obtained a quote from the research from Chulalongkorn University, "We retrospectively analysed data of patients with HBeAg-positive CHB treated with PEG-IFN for 48 weeks. Virological response (VR) was defined as HBeAg clearance and HBV DNA <2,000 IU/ml at 24 weeks post-treatment. The SNPs G-201A, IFNL3 (rs12979860) and HLA-DPA1 (rs3077) were assessed. Among 107 patients, VR was achieved in 45 (42.1%) patients. Hepatitis B surface antigen (HBsAg) clearance and decline (<100 IU/ml) were observed in 10 (9.3%) and 22 (20.6%) patients, respectively. The distribution of GG, GA and AA genotypes of G-201A was 76.6%, 19.6% and 3.7%, respectively. Patients with GG genotype, compared to those with non-GG genotype, achieved higher VR rate (48.8% versus 19.2%; P=0.011), decreased HBsAg (25.6% versus 4.0%; P=0.019), and demonstrated a trend in HBsAg clearance (11.0% versus 4%; P=0.294). Patients with GG genotype had more rapid HBsAg decline and higher baseline serum IP-10 levels than those with non-GG genotype (432.2 +/- 339.0 versus 257.3 +/- 145.7 pg/ml; P=0.028). SNPs rs12979860 and rs3077 were not associated with VR. Logistic regression analysis suggested that SNP G-201A was an independent predictor of VR (odds ratio 3.81, 95% CI 1.31, 11.12; P=0.014)."

According to the news reporters, the research concluded: "Data from this study demonstrated for the first time that IP-10 polymorphism is independently associated with treatment response to PEG-IFN in patients with HBeAg-positive CHB."

Our news correspondents report that additional information may be obtained by contacting P. Tangkijvanch, Chulalongkorn University, Dept. of Biochem, Res Unit Hepatitis & Liver Canc, Fac Med, Bangkok, Thailand. Additional authors for this research include N. Chuaypen, A. Khaiphuesin, N. Posuwan, R. Wasitthaksam, Y. Poovorawan and P. Tangkijvanch.

Oncology - Colon Cancer

Study Data from Chungbuk National University Update Understanding of Colon Cancer (Muscarinic acetylcholine receptors mediate eIF4B phosphorylation in SNU-407 colon cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Colon Cancer have been published. According to news reporting originating from Cheongju, South Korea, by NewsRx correspondents, research stated, "We have previously shown that muscarinic acetylcholine receptors (mAChRs) promote global protein biosynthesis in SNU-407 colon cancer cells. To gain insight into the molecular mechanisms underlying this event, we examined whether mAChRs regulate the phosphorylation of eIF4B (eukaryotic initiation factor 4B), an essential component of the translation machinery."

Financial support for this research came from National Research Foundation of Korea.

Our news editors obtained a quote from the research from Chungbuk National University, "When SNU-407 cells were treated with the cholinergic agonist carbachol, eIF4B was phosphorylated in a dose- and time-dependent manner. This carbachol effect was almost completely blocked by the muscarinic antagonist atropine, demonstrating that mAChRs specifically mediate the phosphorylation of eIF4B. Carbachol-stimulated eIF4B phosphorylation was significantly reduced by the MEK1/2 inhibitor U0126, indicating that the MEK1/2-ERK1/2 pathway plays an important role in mAChR-mediated eIF4B phosphorylation. However, treating the cells with the phosphoinositide 3-kinase (PI3K) inhibitor LY294002 or the mTORC1 (mammalian target of rapamycin complex 1) inhibitor rapamycin had little effect on carbachol-stimulated eIF4B phosphorylation, suggesting that PI3K and mTORC1 are not the key participants in this process. We also observed that the inhibition of protein kinase C (PKC) by GF109203X greatly diminished carbachol-stimulated eIF4B phosphorylation."

According to the news editors, the research concluded: "Together, our data show that mAChRs modulate eIF4B phosphorylation via the ERK1/2 and PKC signaling pathways in SNU-407 colon cancer cells."

For more information on this research see: Muscarinic acetylcholine receptors mediate eIF4B phosphorylation in SNU-407 colon cancer cells. Biochemical and Biophysical Research Communications, 2016;480(3):450-454. Biochemical and Biophysical Research Communications can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Biochemical and Biophysical Research Communications - www.journals.elsevier.com/biochemical-and-biophysical-research-communications/)

The news editors report that additional information may be obtained by contacting N.J. Cho, Chungbuk National University, Dept. of Biochem, Coll Nat Sci, Cheongju 28644, South Korea.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.bbrc.2016.10.069. This DOI is a link to an online electronic document that is either free or for purchase.
Study Data from Churchill Hospital Update Knowledge of Chronic Kidney Disease (Interventions for chronic kidney disease-associated restless legs syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Kidney Diseases and Conditions - Chronic Kidney Disease. According to news originating from Oxford, United Kingdom, by NewsRx correspondents, research stated, "Restless legs syndrome (RLS) is defined as the spontaneous movement of the limbs (mainly legs) associated with unpleasant, sometimes painful sensation which is relieved by moving the affected limb. Prevalence of RLS among people on dialysis has been estimated between 6.6% and 80%.

Our news journalists obtained a quote from the research from Churchill Hospital, "RLS symptoms contribute to impaired quality of life and people with RLS are shown to have increased cardiovascular morbidity and mortality. Various pharmacological and non-pharmacological interventions have been used to treat primary RLS. However, the evidence for use of these interventions in people with chronic kidney disease (CKD) is not well established. The agents used in the treatment of primary RLS may be limited by the side effects in people with CKD due to increased comorbidity and altered drug pharmacokinetics. The aim of this review was to critically look at the benefits, efficacy and safety of various treatment options used in the treatment of RLS in people with CKD and those undergoing renal replacement therapy (RRT). We aimed to define different group characteristics based on CKD stage to assess the applicability of a particular intervention to an individual patient. Search methods We searched the Cochrane Kidney and Transplant Specialised Register to 12 January 2016 through contact with the Information Specialist using search terms relevant to this review. Selection criteria Randomised controlled trials (RCT) and quasi-RCTs that assessed the efficacy of an intervention for RLS in adults with CKD were eligible for inclusion. Studies investigating idiopathic RLS or RLS secondary to other causes were excluded. Data collection and analysis Two authors independently assessed studies for eligibility and conducted risk of bias evaluation. Results were expressed as risk ratios (RR) and their 95% confidence intervals (CI) for dichotomous outcomes, and mean difference (MD) and 95% CI for continuous outcomes. We included nine studies enrolling 220 dialysis participants. Seven studies were deemed to havemoderate to high risk of bias. All studies were small in size and had a short follow-up period (two to six months). Studies evaluated the effects of six different interventions against placebo or standard treatment. The interventions studied included aerobic resistance exercise, gabapentin, ropinirole, levodopa, iron dextran, and vitamins C and E (individually and in combination). Aerobic resistance exercise showed a significant reduction in severity of RLS compared to no exercise (2 studies, 48 participants: MD 7.56, 95% CI - 14.20 to - 0.93; I-2 = 65%), and when compared to exercise with no resistance (1 study, 24 participants: MD - 11.10, 95% CI - 17.11 to - 5.09), however there was no significant reduction when compared to
ropinirole (1 study, 22 participants): MD - 0.55, 95% CI - 6.41 to 5.31). There were no significant differences between aerobic resistance exercise and either no exercise or ropinirole in the physical or mental component summary scores (using the SF-36 form). Improvement in sleep quality varied. There was no significant difference in subjective sleep quality between exercise and no exercise; however one study reported a significant improvement with ropinirole compared to resistance exercise (MD 3.71, 95% CI 0.89 to 6.53). Using the Epworth Sleepiness Scale there were no significant differences between resistance exercise and no exercise, ropinirole, or exercise with no resistance. Two studies reported there were no adverse events and one study did not mention if there were any adverse events. In one study, one patient in each group dropped out but the reason for dropout was not reported. Two studies reported no adverse events and one study did not report adverse events. Gabapentin was associated with reduced RLS severity when compared to placebo or levodopa, and there was a significant improvement in sleep quality, latency and disturbance reported in one study when compared to levodopa. Three patients dropped out due to lethargy (2 patients), and drowsiness, syncope and fatigue (1 patient). Because of a short duration of action, rebound and augmentation were noted with levodopa treatment even though it conferred some benefit in reducing the symptoms of RLS. Reported adverse events were severe vomiting, agitation after caffeine intake, headaches, dry mouth, and gastrointestinal symptoms. One study (25 participants) reported iron dextran reduced the severity of RLS at weeks one and two, but not at week four. Vitamins C, E and C plus E (1 study, 60 participants) helped the symptoms of RLS with minimal side effects (nausea and dyspepsia) but more evidence is needed before any conclusions can be drawn. Authors' conclusions Given the small size of the studies and short follow-up, it can only be concluded that pharmacological interventions and intra-dialytic exercise programs have uncertain effects on RLS in haemodialysis patients. There have been no studies performed in non-dialysis CKD, peritoneal dialysis patients, or kidney transplant recipients. Further studies are warranted before any conclusions can be drawn."

According to the news editors, the research concluded: "Aerobic resistance exercise and ropinirole may be suitable interventions for further evaluation."

For more information on this research see: Interventions for chronic kidney disease-associated restless legs syndrome. Cochrane Database of Systematic Reviews, 2016;(11):1184-1234. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

The news correspondents report that additional information may be obtained from S. Gopaluni, Churchill Hospital, Dept. of Renal Med, Oxford Kidney Unit, Oxford, United Kingdom. Additional authors for this research include M. Sherif and N.A. Ahmadouk.

Drugs and Therapies - Antibiotics

Study Data from College of Pharmacy Update Understanding of Antibiotics (Aerobic Exercise Training as a Potential Cardioprotective Strategy to Attenuate Doxorubicin-Induced Cardiotoxicity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Antibiotics. According to news reporting from Miami, Florida, by NewsRx journalists, research stated, "Doxorubicin is one of the most commonly used cytotoxic anticancer drugs against several cancers. Although a highly effective anticancer drug, the clinical use of doxorubicin is severely limited by its cardiotoxicity which results in morbidity, poor quality of life, and premature mortality."

The news correspondents obtained a quote from the research from the College of Pharmacy, "Only very few clinically accepted methods to minimize doxorubicin-induced cardiac injury are available today, but none of them have proven to be completely successful. Due to limited alternative strategies, a number of potential cardioprotective therapies are currently being investigated for treating and/or preventing doxorubicin-induced cardiotoxicity. Of these potential strategies, aerobic exercise training is the only nonpharmacologic strategy that shows a great deal of promise. Although there are no published human clinical trials, evidence from numerous animal studies suggests that aerobic exercise training, administered prior to, during and/or following doxorubicin therapy, is protective against doxorubicin-induced cardiac injury. Protective properties of exercise training against the cardiotoxicity of doxorubicin have been attributed to a number of potential molecular mechanisms including: enhancing the production of endogenous antioxidant machineries; regulating proapoptotic signaling; stimulating the release, mobilization and homing of cardiac progenitor cells; limiting myocyte turnover; eliciting favorable adaptations in myocardial calcium handling and preventing calcium overload; modulating cardiac AMPK activity; downregulating cardiac autophagy/lysosomal signaling; and reducing myocardial doxorubicin accumulation."

According to the news reporters, the research concluded: "Further preclinical and clinical research is needed to decipher and refine the molecular mechanisms underlying the cardioprotective effects of exercise training, as well as to define the nature and magnitude of the effect of exercise on doxorubicin-induced cardiotoxicity in cancer patients."

Our news journalists report that additional information may be obtained by contacting M.N. Uddin, Larkin Hlth Sci Inst, Coll Pharm, Dept. of Pharmaceut Sci, Miami, FL 33169, United States.

Drugs and Therapies - Mitotic Inhibitors

Study Data from Cumhuriyet University Provide New Insights into Mitotic Inhibitors (The effects of intraperitoneal chemotherapeutic agents on adhesion formation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Mitotic Inhibitors are discussed in a new report. According to news reporting originating in Sivas, Turkey, by NewsRx journalists, research stated, "Intra-abdominal adhesions are a major complication of healing. Furthermore these adhesions may cause morbidity and sometimes mortality for patients, and also are a financial burden to the health system."

The news reporters obtained a quote from the research from Cumhuriyet University, "Cecum abrasion was performed in all rats and solutions containing saline to group 1, 5-fluorouracil to group 2, cisplatin to group 3, paclitaxel to the group 4, and mitomycin-C were administered into the abdomen of the groups, respectively. The intra-abdominal adhesions were scored after the macroscopic evaluation. Among the chemotherapeutic drugs, paclitaxel significantly increases occurring of intra-abdominal adhesions in comparison with the control group and the other drugs according to the evaluation of scoring and statistical studies."

According to the news reporters, the research concluded: "It is suggested to use the drugs which have a proven anti-adhesion feature or barriers to the patients who are going to be applied intraperitoneal chemotherapy with paclitaxel."

Our news correspondents report that additional information may be obtained by contacting C. Yildiz, Cumhuriyet University, Sch Med, Dept. of Obstet & Gynecol, Sivas, Turkey. Additional authors for this research include C. Yildiz, S. Karakus, M. Koc, M. Dogan, M. Turan and K. Karadayi.

Keywords for this news article include: Sivas, Turkey, Eurasia, Drugs and Therapies, Paclitaxel Therapy, Mitotic Inhibitors, Pharmaceuticals, Antineoplastics, Cumhuriyet University.

Drugs and Therapies - Amiodarone Therapy

Study Data from D.C. Millard and Colleagues Update Understanding of Amiodarone Therapy (Identification of Drug-Drug Interactions In Vitro: A Case Study Evaluating the Effects of Sofosbuvir and Amiodarone on hiPSC-Derived Cardiomyocytes)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Amiodarone Therapy is now available. According to news reporting from Atlanta, Georgia, by NewsRx journalists, research stated, "Drug-drug interactions pose a difficult drug safety problem, given the increasing number of individuals taking multiple medications and the relative complexity of assessing the potential for interactions. For example, sofosbuvir-based drug treatments have significantly advanced care for hepatitis C virus-infected patients, yet recent reports suggest interactions with amiodarone may cause severe symptomatic bradycardia and thus limit an otherwise extremely effective treatment."

The news correspondents obtained a quote from the research, "Here, we evaluated the ability of human induced pluripotent stem cell derived cardiomyocytes (hiPSC-CMs) to recapitulate the interaction between sofosbuvir and amiodarone in vitro, and more generally assessed the feasibility of hiPSC-CMs as a model system for drug-drug interactions. Sofosbuvir alone had negligible effects on cardiomyocyte electrophysiology, whereas the sofosbuvir-amiodarone combination produced dose-dependent effects beyond that of amiodarone alone. By comparison, GS-331007, the primary circulating metabolite of sofosbuvir, had no effect alone or in combination with amiodarone. Further mechanistic studies revealed that the sofosbuvir-amiodarone combination disrupted intracellular calcium (Ca2+) handling and cellular electrophysiology at pharmacologically relevant concentrations, and mechanical activity at supra-pharmacological (30x C-max) concentrations. These effects were independent of the common mechanisms of direct ion channel block and P-glycoprotein activity."

According to the news reporters, the research concluded: "These results support hiPSC-CMs as a comprehensive, yet scalable model system for the identification and evaluation of cardioactive pharmacodynamic drug-drug interactions."

Keywords for this news article include: Atlanta, Georgia, United States, North and Central America, Amiodarone Therapy Hydrochloride, Antiarrhythmic Agents, Cardiovascular Agents, Drugs and Therapies, Electrophysiology, Pharmaceuticals, Cardiomyocyte, Cardiology.

Oncology - Non-Small Cell Lung Cancer

Study Data from Dalian Medical University Provide New Insights into Non-Small Cell Lung Cancer (Novel Selective and Potent EGFR Inhibitor that Overcomes T790M-Mediated Resistance in Non-Small Cell Lung Cancer)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Non-Small Cell Lung Cancer. According to news reporting originating from Dalian, People's Republic of China, by NewsRx correspondents, research stated, "Treating patients suffering from EGFR mutant non-small cell lung cancer (NSCLC) with first-generation EGFR tyrosine kinase inhibitors (EGFR TKI) provides excellent response rates. However, approximately 60% of all patients ultimately develop drug resistance due to a second T790M EGFR TKI mutation."

Our news editors obtained a quote from the research from Dalian Medical University, "In this study, we report the novel molecule N-(3-((5-chloro-2-(4-((1-morpholino)methyl)phenylamino)-4-pyrimidinyl)amino)phenyl)acrylamide (DY3002) to preferentially inhibit the EGFR T790M mutant (EGFR(T790M)) (IC50 = 0.71 nM) over wild-type EGFR (IC50 = 448.7 nM) in kinase assays. Compared to rociletinib (SI = 21.4) and osimertinib (SI = 40.9), it significantly increased selectivity (SI = 632.0) against EGFR T790M over wild-type EGFR. Furthermore, in cell-based tests, DY3002, with an IC50 value of 0.037 mM, exhibited enhanced inhibitory potency against H1975 cells. Moreover, AO/EB and DAPI staining assays as well as flow cytometer analyses indicated that DY3002 possesses superior biological properties compared to alternatives. In addition, a rat oral glucose tolerance test revealed that treatment with high drug doses (50 mg/kg) of DY3002 did not result in hyperglycemia, suggesting a reduction of side effects in NSCLC patients will be achievable relative to established EGFR inhibitors."

According to the news editors, the research concluded: "In summary, our findings indicate DY3002 as a promising preclinical candidate for effective treatment of patients with EGFR T790M-mutated NSCLC."

**Life Science Research - Molecular Biology**

**Study Data from Dana-Farber Cancer Institute Provide New Insights into Molecular Biology (PKM2, cancer metabolism, and the road ahead)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Life Science Research - Molecular Biology are presented in a new report. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "A major metabolic aberration associated with cancer is a change in glucose metabolism. Isoform selection of the glycolytic enzyme pyruvate kinase has been implicated in
the metabolic phenotype of cancer cells, and specific pyruvate kinase isoforms have been suggested to support divergent energetic and biosynthetic requirements of cells in tumors and normal tissues."

Our news journalists obtained a quote from the research from Dana-Farber Cancer Institute, "PKM2 isoform expression has been closely linked to embryogenesis, tissue repair, and cancer. In contrast, forced expression of the PKM1 isoform has been associated with reduced tumor cell proliferation. Here, we discuss the role that PKM2 plays in cells and provide a historical perspective for how the study of PKM2 has contributed to understanding cancer metabolism."

According to the news editors, the research concluded: "We also review recent studies that raise important questions with regard to the role of PKM2 in both normal and cancer cell metabolism."

For more information on this research see: PKM2, cancer metabolism, and the road ahead. EMBO Reports, 2016;17(12):1721-1730. EMBO Reports can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Nature Publishing Group - www.nature.com; EMBO Reports - www.nature.com/embr/)

Our news journalists report that additional information may be obtained by contacting M.G. Vander Heiden, Dana Farber Canc Inst, Dept. of Med Oncol, Boston, MA 02115, United States. Additional authors for this research include T. Jacks and M.G. Vander Heiden.

Oncology - Carcinomas

Study Data from Dana-Farber Cancer Institute Update Understanding of Carcinomas (Outcomes with volume-based dose specification in CT-planned high-dose-rate brachytherapy for stage I-II cervical carcinoma: A 10-year institutional experience)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Carcinomas have been presented. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "To determine prognostic factors for progression-free survival (PFS) and overall survival (OS) for stage I-II cervical-cancer patients treated using computed-tomography (CT)-planned high-dose-rate (HDR) intracavitary brachytherapy (BT). A total of 150 patients were treated for Stage I-II cervical cancer using CT-planned BT between 4/2004 and 10/2014."

Financial support for this research came from NIH.

Our news journalists obtained a quote from the research from Dana-Farber Cancer Institute, "Of these, 128 were eligible for inclusion. Kaplan-Meier local control (LC), pelvic
control (PC), overall survival (OS), and PFS estimates were calculated. After a median follow-up of 30 months, the 2-year LC rate was 96%, PFS was 88%, and OS was 88%. Overall, 18 patients (14%) experienced any recurrence (AR), 8 had distant recurrence only and 10 had a combination of local, pelvic, regional, and distant recurrence. No patients had LR only. A prognostic factor for AR was tumor size >4 cm (p = 0.01). Patients with tumors >4 cm were 3.3 times more likely to have AR than those with tumors cm (hazard ratio [FIR] = 3.3; 95% confidence interval [CI] 128-9.47). Point A was 85% of prescription for tumors < 4 cm and decreased approximately 3% over 5 fractions compared to 90% of prescription for tumors > 4 cm that decreased approximately 4% over 5 fractions. Two patients (2%) experienced grade 2 late toxicity. There were no acute or late grade >= 3 toxicities. CT-planned BT resulted in excellent local control and survival. Large tumor size was associated with an increased risk of recurrence outside the radiation field and worse PFS and OS. A volume-optimized plan treated a smaller area than a point A standard plan for patients with Stage I-II cervical cancer that have received chemoradiation."

According to the news editors, the research concluded: "Given the outstanding LC achieved with modern therapy including chemoradiation, HDR, and image-based BT, further efforts to combat spread outside the radiation field with novel therapies are warranted."

For more information on this research see: Outcomes with volume-based dose specification in CT-planned high-dose-rate brachytherapy for stage I-II cervical carcinoma: A 10-year institutional experience. Gynecologic Oncology, 2016;143(3):545-551. Gynecologic Oncology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Cardiology**

**Study Data from Department of Cardiology Update Knowledge of Cardiology (Risk Factors Associated with Left-Sided Cardiac Valve Calcification: A Case Control Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting originating in Jiangyin, People's Republic of China, by NewsRx journalists, research stated, "To identify risk factors associated with cardiac valve calcification that is easily detectable through routine blood tests in patients who received valve replacement therapy. Four
hundred patients with valvular heart disease who underwent valve replacement surgery between December 2009 and January 2013 were enrolled in this study."

The news reporters obtained a quote from the research from the Department of Cardiology, "Of these, 77 had valve calcification; the other 323 did not. Multivariate logistic regression analysis was used to assess for risk factors associated with valve calcification. In our study population, rheumatic valve lesions were the most common reason for valve replacement. Degenerative nonstenotic valve lesion was a protective factor and degenerative stenotic valve lesion was a strong risk factor for valve calcification. Serum levels of gamma-glutamyl transferase (GGT) of between 30 and 46 IU/l and >90 IU/l and total bilirubin (TBIL) of between 15 and 20 mmol/l were positively correlated with valve calcification. Meanwhile, serum calcium (Ca2+) levels of between 2.3 and 2.4 mmol/l were negatively correlated with rheumatic valve calcification. Degenerative stenotic lesion is a risk factor and degenerative nonstenotic lesion a protective factor for cardiac valve calcification."

According to the news reporters, the research concluded: "Serum GGT and TBIL levels are positively correlated and serum Ca2+ levels negatively correlated with rheumatic cardiac valve calcification."

For more information on this research see: Risk Factors Associated with Left-Sided Cardiac Valve Calcification: A Case Control Study. Cardiology, 2016;134(1):26-33. Cardiology can be contacted at: S. Transfusion Medicine - Blood Transfusion

Study Data from Department of Hematology Provide New Insights into Blood Transfusion (Lenalidomide with or without erythropoietin in transfusion-dependent erythropoiesis-stimulating agent-refractory lower-risk MDS without 5q deletion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transfusion Medicine - Blood Transfusion. According to news reporting from Creteil, France, by NewsRx journalists, research stated, "After failure of erythropoiesis-stimulating agents (ESAs), lenalidomide (LEN) yields red blood cell (RBC) transfusion independence (TI) in 20-30% of lower-risk non-del5q
myelodysplastic syndrome (MDS). Several observations suggest an additive effect of ESA and LEN in this situation."

The news correspondents obtained a quote from the research from the Department of Hematology, "We performed a randomized phase III study in 131 RBC transfusion-dependent (TD, median transfusion requirement six RBC units per 8 weeks) lower-risk ESA-refractory non-del5q MDS. Patients received LEN alone, 10 mg per day, 21 days per 4 weeks (L arm) or LEN (same schedule) + erythropoietin (EPO) beta, 60,000 U per week (LE arm). In an intent-to-treat (ITT) analysis, erythroid response (HI-E, IWG 2006 criteria) after four treatment cycles (primary end point) was 23.1% (95% CI 13.5-35.2) in the L arm and 39.4% (95% CI 27.6-52.2) in the LE arm (p=0.044), while RBC-TI was reached in 13.8 and 24.2% of the patients in the L and LE arms, respectively (p=0.13). Median response duration was 18.1 and 15.1 months in the L and LE arms, respectively (p=0.47). Side effects were moderate and similar in the two arms. Low baseline serum EPO level and a G polymorphism of CRBN gene predicted HI-E."

According to the news reporters, the research concluded: "Combining LEN and EPO significantly improves erythroid response over LEN alone in lower-risk non-del5q MDS patients with anemia resistant to ESA."

For more information on this research see: Lenalidomide with or without erythropoietin in transfusion-dependent erythropoiesis-stimulating agent-refractory lower-risk MDS without 5q deletion. Leukemia, 2015;30(4):897-905. (Nature Publishing Group - www.nature.com/; Leukemia - www.nature.com/leu/)

Our news journalists report that additional information may be obtained by contacting A. Toma, Dept. of Hematology, Hopital Universitaire Henri Mondor, Assistance Publique-Hopitaux de Paris (APHP) and Paris 12 University, Creteil, France. Additional authors for this research include O. **Stem Cell Research - Hematopoietic Stem Cells**

**Study Data from Department of Infectious Disease Update**

**Understanding of Hematopoietic Stem Cells (Chlorhexidine bathing for the prevention of colonization and infection with multidrug-resistant microorganisms in a hematopoietic stem cell ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Stem Cell Research - Hematopoietic Stem Cells have been presented. According to news reporting originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "Health care associated infections (HAIs) are currently among
the major challenges to the care of hematopoietic stem cell transplantation (HSCT) patients. The objective of the present study was to evaluate the impact of 2% chlorhexidine (CHG) bathing on the incidence of colonization and infection with vancomycin-resistant Enterococcus (VRE), multidrug-resistant (MDR) gram-negative pathogens, and to evaluate their CHG minimum inhibitory concentration (MIC) after the intervention.

Our news editors obtained a quote from the research from the Department of Infectious Disease, "A quasi-experimental study with duration of 9 years was conducted. VRE colonization and infection, HAI rates, and MDR gramnegative infection were evaluated by interrupted time series analysis. The antibacterial susceptibility profile and mechanism of resistance to CHG were analyzed in both periods by the agar dilution method in the presence or absence of the efflux pump inhibitor carbonyl cyanide-m-chlorophenyl hydrazone (CCCP) and presence of efflux pumps (qacA/E, qacA, qacE, cepA, AdeA, AdeB, and AdeC) by polymerase chain reaction (PCR). The VRE colonization and infection rates were significantly reduced in the postintervention period (P=0.001). However, gramnegative MDR rates in the unit increased in the last years of the study. The CHG MICs for VRE increased during the period of exposure to the antiseptic. A higher MIC at baseline period was observed in MDR gram-negative strains. The emergence of a monoclonal Pseudomonas aeruginosa clone was observed in the second period."

According to the news editors, the research concluded: "Concluding, CHG bathing was efficient regarding VRE colonization and infection, whereas no similar results were found with MDR gram-negative bacteria."

For more information on this research see: Chlorhexidine bathing for the prevention of colonization and infection with multidrug-resistant microorganisms in a hematopoietic stem cell transplantation unit over a 9-year period Impact on chlorhexidine susceptibility. Medicine, 2016;95(46):146-153. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

The news editors report that additional information may be obtained by contacting E.T. Mendes, Univ Sao Paulo??Inst Heart, Dept. of Infect Dis, Sao Paulo, Brazil. Leukocyte Diseases and Conditions - Neutropenia

Study Data from Department of Pediatrics Provide New Insights into Neutropenia (Hydroxyurea for reducing blood transfusion in non-transfusion dependent beta thalassaemias)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Leukocyte Diseases and Conditions - Neutropenia. According to news reporting from George Town, Malaysia, by NewsRx
journalists, research stated, "Non-transfusion dependent beta thalassaemia is a subset of inherited haemoglobin disorders characterised by reduced production of the beta globin chain of the haemoglobin molecule leading to anaemia of varying severity. Although blood transfusion is not a necessity for survival, it is required when episodes of chronic anaemia occur."

The news correspondents obtained a quote from the research from the Department of Pediatrics, "This chronic anaemia can impair growth and affect quality of life. People with non-transfusion dependent beta thalassaemia suffer from iron overload due to their body's increased capability of absorbing iron from food sources. Iron overload becomes more pronounced in those requiring blood transfusion. People with a higher foetal haemoglobin level have been found to require fewer blood transfusions. Hydroxyurea has been used to increase foetal haemoglobin level; however, its efficacy in reducing transfusion, chronic anaemia complications and its safety need to be established. To assess the effectiveness, safety and appropriate dose regimen of hydroxyurea in people with non-transfusion dependent beta thalassaemia (haemoglobin E combined with beta thalassaemia and beta thalassaemia intermedia).

Search methods We searched the Cochrane Cystic Fibrosis and Genetic Disorders Group's Haemoglobinopathies Trials Register, compiled from electronic database searches and handsearching of relevant journals. We also searched ongoing trials registries and the reference lists of relevant articles and reviews. Date of last search: 30 April 2016. Selection criteria Randomised or quasi-randomised controlled trials of hydroxyurea in people with non-transfusion dependent beta thalassaemia comparing hydroxyurea with placebo or standard treatment or comparing different doses of hydroxyurea. Data collection and analysis Two authors independently applied the inclusion criteria in order to select trials for inclusion. Both authors assessed the risk of bias of trials and extracted the data. A third author verified these assessments. No trials comparing hydroxyurea with placebo or standard care were found. However, we included one randomised controlled trial (n = 61) comparing 20 mg/kg/day with 10 mg/kg/day of hydroxyurea for 24 weeks. Both haemoglobin and foetal haemoglobin levels were lower at 24 weeks in the 20 mg group compared with the 10 mg group, mean difference -2.39 (95% confidence interval -2.8 to -1.98) and mean difference -1.5 (95% confidence interval -1.83 to -1.17), respectively. Major adverse effects were significantly more common in the 20 mg group, for neutropenia risk ratio 9.93 (95% confidence interval 1.34 to 73.97) and for thrombocytopenia risk ratio 3.68 (95% confidence interval 1.13 to 12.07). No difference was reported for minor adverse effects (gastrointestinal disturbances and raised liver enzymes). The effect of hydroxyurea on transfusion frequency was not reported. The overall quality for the outcomes reported was graded as very low mainly because the outcomes were derived from only one small study with an unclear method of allocation concealment. Authors' conclusions There is no evidence from randomised controlled trials to show whether hydroxyurea has any effect compared with controls on the need for blood transfusion. Administration of 10 mg/kg/day compared to 20 mg/kg/day of hydroxyurea resulted in higher haemoglobin levels and seems safer with fewer adverse effects. It has not been reported whether hydroxyurea is capable of reducing the need for blood transfusion."

According to the news reporters, the research concluded: "Large well-designed randomised controlled trials with sufficient duration of follow up are recommended."

For more information on this research see: Hydroxyurea for reducing blood transfusion in non-transfusion dependent beta thalassaemias. Cochrane Database of Systematic Reviews, 2016;(10):1659-1694. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news journalists report that additional information may be obtained by contacting W.C. Foong, Penang Med College, Dept. of Paediat, George Town 10450, Malaysia. Additional authors for this research include J.J. Ho, C.K. Loh and V. Viprakasit.
Hormones

Study Data from Duke University Update Knowledge of Hormones
(Thyroid hormone use during cardiac transplant organ procurement)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Hormones. According to news reporting from Durham, North Carolina, by NewsRx journalists, research stated, "Acute hypothyroidism after brain death results in hemodynamic impairments that limit availability of donor hearts. Thyroid hormone infusions can halt that process and lead to increased utilization of donor organs, but prolonged use of thyroid replacement has not been well studied."

Financial support for this research came from National Institutes of Health.

The news correspondents obtained a quote from the research from Duke University, "We developed a 15-question survey regarding policies, procedures, and reporting of thyroid hormone use by organ procurement organizations (OPOs). The survey was posted for 5 weeks on the Association of OPOs Portal. We received 29 responses, representing 24 OPOs. Seventy-two percent reported their OPOs use thyroid hormone for all potential donors and 90% have a protocol for thyroid hormone use. There is a large variation in the maximum dose of thyroid hormone used, and many OPOs have no weaning protocol. Most OPOs do not collect data on total thyroid hormone administered during procurement and would favor more detailed report of thyroid hormone use. Thyroid hormone use can have important implications for organ selection and cardiac function before and after transplantation. Protocols vary widely with respect to why and how to use and wean thyroid hormone."

According to the news reporters, the research concluded: "We believe there should be more detailed reporting of thyroid hormone use for future studies to ensure appropriate donor management."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ctr.12860. This DOI is a link to an online electronic document that is either free or for purchase.
Keywords for this news article include: Durham, North Carolina, United States, North and Central America, Thyroid Hormones, Cardiology, Duke University.

Neurodegenerative Diseases and Conditions -

Study Data from Durham University Update Understanding of Alzheimer Disease (ImmunoPEGliposome-mediated reduction of blood and brain amyloid levels in a mouse model of Alzheimer's disease is restricted to aged animals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Neurodegenerative Diseases and Conditions - Alzheimer Disease is the subject of a report. According to news reporting out of Stockton on Tees, United Kingdom, by NewsRx editors, research stated, "The accumulation of extracellular amyloid-beta (A beta) and intracellular neurofibrillary tangles (hyper-phosphorylated Tau) in the brain are two major neuropathological hallmarks of Alzheimer's disease (AD). Active and passive immunotherapy may limit cerebral A beta deposition and/or accelerate its clearance."

Financial support for this research came from European Community's Seventh Framework Programme.

Our news journalists obtained a quote from the research from Durham University, "With the aid of a newly characterized monoclonal anti-A beta antibody we constructed immunoPEGliposomes with high avidity for capturing A beta in the periphery. The functionality of these vesicles in modulating A beta uptake by both human brain capillary endothelial hCMEC/D3 cells (suppressing uptake) and THP-1 phagocytes (stimulating uptake) was confirmed in vitro. The multivalent immunoliposomes dramatically reduced circulating and brain levels of A beta(1-40), and particularly A beta(1-42), in 'aged' (16 month-old), but not 'adult' (10 month-old) APP/PS1 transgenic mice on repeated intraperitoneal administration. Furthermore, the immunoPEGliposome-mediated reduction in amyloidosis correlated with lower levels of glial fibrillary acidic protein (GFAP) and reactive glia (GFAP-positive cells). This treatment also lowered the ratio of phosphorylated Tau to total Tau. The therapeutic efficacy of immunoliposome treatment was superior to free monoclonal antibody administration (at an equivalent antibody dose)."

According to the news editors, the research concluded: "The potential mechanisms and significance of age-dependent immunoliposome therapy in AD is discussed."

For more information on this research see: ImmunoPEGliposome-mediated reduction of blood and brain amyloid levels in a mouse model of Alzheimer's disease is restricted to aged animals. Biomaterials, 2017;112():141-152. Biomaterials can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. Study Data from Dwight D. Eisenhower Army Medical Center Update Understanding of Angiology (Aortic Dissection as a Cause of Pulsus Bisferiens: A Case Report and Review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Angiology is now available. According to news reporting originating from Fort Gordon, Georgia, by NewsRx correspondents, research stated, "We present a case of a 62-year-old woman who developed an aortic dissection after aortic valve replacement for aortic stenosis and supracoronary replacement of the ascending aorta for aneurysmal dilation."

Our news editors obtained a quote from the research from Dwight D. Eisenhower Army Medical Center, "Dynamic compression of the distal aorta by the dissection flap was identified with the detection of abnormal continuous wave Doppler signals heard while performing ankle-brachial indices. Duplex ultrasound (US) and Doppler spectral waveforms confirmed dynamic compression of the distal aorta with each cardiac cycle."

According to the news editors, the research concluded: "We review some of the characteristics of continuous wave Doppler signals, specifically discussing the distinguishing characteristics of pulsus bisferiens, and the use of duplex US in imaging the distal aorta."

The news editors report that additional information may be obtained by contacting C.M. Riojas, Dwight D Eisenhower Army Med Center, Dept. of Surg, Ft Gordon, GA 30905, United States. Additional authors for this research include A. Dodge, D.R. Gallo and P.W. White.

Study Data from Eastern Michigan University Provide New Insights into Fibromuscular Dysplasia (Diagnosed and living with fibromuscular dysplasia: A qualitative inquiry)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Fibromuscular Dysplasia have been published. According to news reporting out of Ypsilanti, Michigan, by NewsRx editors, research stated, "Fibromuscular dysplasia (FMD) is a vascular disorder about which little has been known until recently. Patients with FMD may suffer from hypertension, aneurysms, or strokes, as well as symptoms associated with local artery damage."

Our news journalists obtained a quote from the research from Eastern Michigan University, "As a result of advances in vascular medicine and growing outcomes registries, we now have a better understanding of the FMD disease process and epidemiology. Nevertheless, the consequences of FMD on patients' day-to-day experiences and mental health status are not well understood. The purpose of this study was to begin to identify and characterize the experiences of living with FMD from the perspective of the patient using qualitative inquiry. Interviews with 19 FMD patients (18 female, 1 male) were conducted, audio-recorded, transcribed verbatim, and content analyzed. Individuals with FMD reported a complex array of psychological, physical, emotional, social, and health care concerns, which may be underdiagnosed."

According to the news editors, the research concluded: "Findings suggest new opportunities for enhancing patient care."

Our news journalists report that additional information may be obtained by contacting S.M. Bumpus, Eastern Michigan University, Sch Nursing, Ypsilanti, MI 48197, United States. Additional authors for this research include C. Kuck, S.T. Heidt and M. Bluhm.

Drugs and Therapies - Antiarrhythmic Agents

Study Data from Eskisehir Osmangazi University Provide New Insights into Antiarrhythmic Agents (Treatment with propranolol for infantile hemangiomas: single-center experience)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antiarrhythmics is the subject of a report. According to news reporting originating from Eskisehir, Turkey, by NewsRx correspondents, research stated, "Infantile hemangiomas (IHs) are the most common soft tissue tumors of infancy. Although spontaneous regression is expected, medical treatment is needed in approximately 10-20% of cases."

Our news editors obtained a quote from the research from Eskisehir Osmangazi University, "We aimed to assess the safety and efficacy of systemic propranolol for the treatment of IH. Medical records of 34 eligible patients were analyzed retrospectively. Treatment indications were local complications (hemorrhage, ulceration) in 38.2% of patients, cosmetic risk and face deformity in 35.3%, life-threatening organ dysfunction in 17.6%, and impending visual impairment in 8.8%. The median age at start of treatment with propranolol was 3.5 months (range, 2-65 months). The median duration of propranolol treatment was 8 months (3-12). Response was graded as excellent (>75% improvement) in 30 patients (88.2%) and good (50-75% improvement) in 3 (8.9%). Recurrence was not observed after termination of treatment. None of our patients showed severe side effects at the beginning of or during the treatment. Propranolol is a well-tolerated, efficacious, and safe drug for treatment of IH. It can be initiated and administered in the outpatient setting."

According to the news editors, the research concluded: "Our report supports the excellent effect and good tolerance of this novel therapy, and we propose the use of propranolol as first-line treatment for IH."

The news editors report that additional information may be obtained by contacting A.B. Turhan, Eskisehir Osmangazi Univ, Fac Med, Div Pediat Hematol & Oncol, Eskisehir, Turkey. Additional authors for this research include O. Bor and Z.C. Ozdemir.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jocd.12220. This DOI is a link to an online electronic document that is either free or for purchase.

Study Data from Eskisehir Osmangazi University Update Knowledge of Peptides and Proteins (The Effects of Beta Amyloid Peptide 1-42 on Isolated Rat Hearts and Ileum Smooth Muscle)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Peptides and Proteins is the subject of a report. According to news reporting originating from Eskisehir, Turkey, by NewsRx correspondents, research stated, "Neurotoxic beta amyloid peptides (beta APs) are involved in the pathogenesis of Alzheimer disease. beta AP(1-42) may also play a role in the regulation of cardiovascular functions. Therefore, we investigated the possible effects of beta AP(1-42) on isolated rat heart and ileum."

Our news editors obtained a quote from the research from Eskisehir Osmangazi University, "The hearts were perfused with modified Krebs-Henseleit solution. Left ventricular developed pressure (LVDP), maximal rate of pressure development of left ventricle (+dP/dt (max)), heart rate, coronary flow, monophasic action potential amplitude (MAPamp), MAP duration at 90% repolarization (MAP(90)) and contractions of ileum were measured. One, 10 and 100 nmol/l doses of beta AP(1-42) significantly decreased LVDP, +dP/dt(max) and heart rate. The dose of 1 nmol/l did not change coronary flow, but 10 and 100 nmol/l doses significantly reduced it. All doses of beta AP(1-42) did not alter MAPamp, but increased MAP(90). beta AP(1-42) (1, 10, 100, 1,000 nmol/l) also did not influence ileum contractions. We suggest that beta AP(1-42) produces negative inotropic and negative chronotropic effects with an increase in MAP duration."

According to the news editors, the research concluded: "Furthermore, beta AP(1-42) at high doses decreases coronary flow."

For more information on this research see: The Effects of Beta Amyloid Peptide 1-42 on Isolated Rat Hearts and Ileum Smooth Muscle. Pharmacology, 2016;98(5-6):261-266. Herpesvirus Diseases and Conditions - Herpes...

Study Data from Eye Institute Update Understanding of Herpes Simplex Virus (Oral antivirals for preventing recurrent herpes simplex keratitis in people with corneal grafts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Herpesvirus Diseases and Conditions - Herpes Simplex Virus have been presented. According to news reporting out of Melbourne, Australia, by NewsRx editors, research stated, "Ocular herpes is a viral infection of the eye caused by the herpes simplex virus (HSV), a double-stranded DNA virus. Corneal scarring caused by herpes simplex keratitis (HSK) is the leading infectious cause of penetrating corneal graft in high-income countries."

Our news journalists obtained a quote from the research from Eye Institute, "Acyclovir is an antiviral drug known to have a protective effect against recurrences in herpetic eye disease. While there are some studies which have evaluated the effects of intervention with oral antiviral in preventing such recurrences in people with corneal grafts, a systematic review of all comparative clinical trials has not been previously undertaken. To assess the efficacy of oral antivirals such as acyclovir in any dosage when taken for six months or more, in preventing recurrence of herpetic keratitis in people having corneal graft surgery for herpetic keratitis.

Search methods We searched CENTRAL (which contains the Cochrane Eyes and Vision Trials Register) (2016, Issue 5), Ovid MEDLINE, Ovid MEDLINE In-Process and Other Non-Indexed Citations, Ovid MEDLINE Daily, Ovid OLDMEDLINE (January 1946 to June 2016), Embase (January 1980 to June 2016), the ISRCTN registry (www.isrctn.com/editAdvancedSearch), ClinicalTrials.gov (www.clinicaltrials.gov), and the World Health Organization (WHO) International Clinical Trials Registry Platform (ICTRP) (www.who.int/ictrp/search/en). We did not use any date or language restrictions in the electronic searches for trials. We last searched the electronic databases on 1 June 2016. We handsearched conference proceedings and contacted authors of the included studies and researchers active in the field. Selection criteria We included randomised controlled trials (RCTs). People enrolled in these trials had corneal grafts for HSK. The intervention was oral antivirals for six months or more following the corneal graft surgery, and this was compared to no treatment or placebo. Data collection and analysis Two review authors independently assessed trial quality and extracted data. We contacted trial investigators for any clarification or missing information. We graded the certainty of the evidence using GRADE. We included three trials, involving 126 participants, comparing the use of oral acyclovir to no treatment or placebo. Two studies were conducted in single centres in Turkey and the USA, and one was multi-centred in the Netherlands. In general, the studies were poorly reported and it was difficult to judge the extent to which bias had been avoided. Oral acyclovir may reduce the risk of recurrence of herpetic keratitis (risk ratio (RR) 0.29, 95% confidence interval (CI) 0.13 to 0.64, 126 people, low-certainty evidence). Based on data from the included trials, this corresponds to approximately 23 fewer cases of HSK recurrence (95% CI 29 fewer cases to 12 fewer cases) per 100 corneal graft operations if oral acyclovir is used. Oral acyclovir may reduce the risk of graft failure (RR 0.40, 95% CI 0.16 to 0.97, 126 people, low-certainty evidence). Based on data from the included trials, this corresponds to approximately 13 fewer cases of graft failure (95% CI 18 fewer cases to 1 fewer cases) per 100 corneal graft operations if oral acyclovir is used. None of the studies reported any serious side effects of the antivirals necessitating stoppage or change. None of the trials reported outcomes over the long term (more than two years) or any data on quality of life."
According to the news editors, the research concluded: "Authors' conclusions Compared to placebo or to no treatment, oral antiviral (acyclovir) may reduce the risk of recurrence of herpetic keratitis in the first 12 months in eyes that have undergone corneal graft surgery."

For more information on this research see: Oral antivirals for preventing recurrent herpes simplex keratitis in people with corneal grafts. Cochrane Database of Systematic Reviews, 2016;(11):2366-2393. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news journalists report that additional information may be obtained by contacting U.K. Bhatt, Vis Eye Inst, Melbourne, Vic 3004, Australia. Additional authors for this research include M.A. Karim, J.I. Prydal, S.V. Maharajan and U. Fares.

Oncology - Melanoma

Study Data from Faculty of Sciences Update Knowledge of Melanoma (Innate immunity based cancer immunotherapy: B16-F10 murine melanoma model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Melanoma is the subject of a report. According to news originating from Ceske Budejovice, Czech Republic, by NewsRx correspondents, research stated, "Using killed microorganisms or their parts to stimulate immunity for cancer treatment dates back to the end of 19th century. Since then, it undergone considerable development."

Our news journalists obtained a quote from the research from the Faculty of Sciences, "Our novel approach binds ligands to the tumor cell surface, which stimulates tumor phagocytosis. The therapeutic effect is further amplified by simultaneous application of agonists of Toll-like receptors. We searched for ligands that induce both a strong therapeutic effect and are safe for humans. B16-F10 murine melanoma model was used. For the stimulation of phagocytosis, mannan or N-formylmethionyl-leucyl-phenylalanine, was covalently bound to tumor cells or attached using hydrophobic anchor. The following agonists of Toll-like receptors were studied: monophosphoryl lipid A (MPLA), imiquimod (R-837), resiquimod (R-848), poly (I: C), and heat killed Listeria monocytogenes. R-848 proved to be the most suitable Toll-like receptor agonist for our novel immunotherapeutic approach. In combination with covalently bound mannan, R-848 significantly reduced tumor growth. Adding poly(I: C) and L. monocytogenes resulted in complete recovery in 83% of mice and in their protection from the re-transplantation of melanoma cells."

According to the news editors, the research concluded: "An efficient cancer treatment results from the combination of Toll-like receptor agonists and phagocytosis stimulating ligands bound to the tumor cells."

Keywords for this news article include: Ceske Budejovice, Czech Republic, Europe, Drugs and Therapies, Immunotherapy, Phagocytosis, Oncology, Melanoma, Cancer, Faculty of Sciences.

**Oncology - Ovarian Cancer**

**Study Data from First Affiliated Hospital Provide New Insights into Ovarian Cancer (Comprehensive analysis of lncRNA-mRNA co-expression patterns identifies immune-associated lncRNA biomarkers in ovarian cancer malignant progression)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Ovarian Cancer have been published. According to news reporting out of Heilongjiang, People's Republic of China, by NewsRx editors, research stated, "Ovarian cancer (OV) is the most common and lethal gynecological tumor with a poor prognosis for women; however, the regulatory roles of the long non-coding RNAs (lncRNAs) in ovarian malignant progression are insufficiently understood. Here, we investigated the expression patterns of lncRNAs and mRNAs in the high-throughput molecular profiles of 399 OV patients and constructed a functional lncRNA-mRNA co-expression network across OV malignant progression."

Our news journalists obtained a quote from the research from First Affiliated Hospital, "We found that two protective lncRNAs, RP11-284N8.3.1 and AC104699.1.1, were not only differentially expressed throughout the progression of malignant OV but were also independently predictive of the survival of patients with different OV stages. A functional analysis of the two lncRNAs predicted their roles in immune system activation and other anti-tumor processes in the OV microenvironment. Integrating these two lncRNAs into an OV risk model was able to significantly stratify patients into different risk groups. Overall, our analysis effectively provides insights into the lncRNA association with malignant OV progression."

According to the news editors, the research concluded: "The two-lncRNA signature is a candidate biomarker for the prognosis of patients with OV and may enable a more accurate prediction of survival."

For more information on this research see: Comprehensive analysis of lncRNA-mRNA co-expression patterns identifies immune-associated lncRNA biomarkers in ovarian cancer malignant progression. *Scientific Reports*, 2015;5():17683. Lipid Research

Study Data from French National Institute of Health and Medical Research (INSERM) Update Knowledge of Lipid Research (Expression profile of hepatic genes related to lipid homeostasis in LSR heterozygous mice contributes to their increased ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Lipid Research. According to news reporting from Nancy, France, by NewsRx journalists, research stated, "Perturbations of lipid homeostasis manifest as dyslipidemias and obesity, which are significant risk factors for atherosclerosis and diabetes. Lipoprotein receptors in the liver are key players in the regulation of lipid homeostasis, among which the hepatic lipolysis stimulated lipoprotein receptor, LSR, was recently shown to play an important role in the removal of lipoproteins from the circulation during the postprandial phase."

Funders for this research include Higher Education Commission of Pakistan, French Ministry of Higher Education and Research.

The news correspondents obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "Since heterozygous LSR+/− mice demonstrate moderate dyslipidemia and develop higher body weight gain in response to high-fat diet compared with littermate LSR+/+ controls, we questioned if LSR heterozygosity could affect genes related to hepatic lipid metabolism. A target-specific qPCR array for 84 genes related to lipid metabolism was performed on mRNA isolated from livers of 6 mo old female LSR+/+ mice and LSR+/+ littermates following a 6 wk period on a standard (STD) or high-fat diet (60% kcal, HFD). Of the 84 genes studied, 32 were significantly downregulated in STD-LSR+/− mice compared with STD-LSR+/+, a majority of which were PPAR alpha target genes involved in lipid metabolism and transport, and insulin and adipokine-signaling pathways. Of these 32 genes, 80% were also modified in HFD-LSR+/+, suggesting that STD-LSR+/− mice demonstrated a predisposition towards a 'high-fat'-like profile, which could reflect dysregulation of liver lipid homeostasis."

According to the news reporters, the research concluded: "Since similar profiles of genes were affected by either LSR heterozygosity or by high-fat diet, this would suggest that LSR is a key receptor in regulating hepatic lipid homeostasis, and whose downregulation combined with a Western-type diet may increase predisposition to diet-induced obesity."

For more information on this research see: Expression profile of hepatic genes
related to lipid homeostasis in LSR heterozygous mice contributes to their increased response to high-fat diet. *Physiological Genomics*, 2016;48(12):928-935. *Physiological Genomics* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

**Immunology - Immune System**

**Study Data from Friedrich-Alexander-University Update Knowledge of Immune System (Blood-borne phagocytes internalize urate microaggregates and prevent intravascular NETosis by urate crystals)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immunology - Immune System. According to news reporting from Erlangen, Germany, by NewsRx journalists, research stated, "Hyperuricemia is strongly linked to cardiovascular complications including atherosclerosis and thrombosis. In individuals with hyperuricemia, needle-shaped monosodium urate crystals (nsMSU) frequently form within joints or urine, giving rise to gouty arthritis or renal calculi, respectively."

The news correspondents obtained a quote from the research from Friedrich-Alexander-University, "These nsMSU are potent instigators of neutrophil extracellular trap (NET) formation. Little is known on the mechanism(s) that prevent nsMSU formation within hyperuricemic blood, which would potentially cause detrimental consequences for the host. Here, we report that complement proteins and fetuins facilitate the continuous clearance by blood-borne phagocytes and resident macrophages of small urate microaggregates (UMA; <1 μm in size) that initially form in hyperuricemic blood. If this clearance fails, UMA exhibit bipolar growth to form typical full-sized nsMSU with a size up to 100 μm. In contrast to UMA, nsMSU stimulated neutrophils to release NETs. Under conditions of flow, nsMSU and NETs formed densely packed DNase I-resistant tophus-like structures with a high obstructive potential, highlighting the importance of an adequate and rapid removal of UMA from the circulation."

According to the news reporters, the research concluded: "Under pathological conditions, intravascularly formed nsMSU may hold the key to the incompletely understood association between NET-driven cardiovascular disease and hyperuricemia."

For more information on this research see: Blood-borne phagocytes internalize urate microaggregates and prevent intravascular NETosis by urate crystals. *Scientific Reports*, 2016;6 ():1-13. *Scientific Reports* can be contacted at: Nature Publishing Group, Macmillan Building,
Study Data from Genentech, Inc. Provide New Insights into Immunoglobulins (Physiologically based pharmacokinetic models of small molecules and therapeutic antibodies: a mini-review on fundamental concepts and applications)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immunology - Immunoglobulins have been presented. According to news reporting originating in South San Francisco, California, by NewsRx journalists, research stated, "The mechanisms of absorption, distribution, metabolism and elimination of small and large molecule therapeutics differ significantly from one another and can be explored within the framework of a physiologically based pharmacokinetic (PBPK) model. This paper briefly reviews fundamental approaches to PBPK modeling, in which drug kinetics within tissues and organs are explicitly represented using physiologically meaningful parameters."

The news reporters obtained a quote from the research from Genentech, Inc., "The differences in PBPK models applied to small/large molecule drugs are highlighted, thus elucidating differences in absorption, distribution and elimination properties between these two classes of drugs in a systematic manner. The absorption of small and large molecules differs with respect to their common extravascular routes of delivery (oral versus subcutaneous). The role of the lymphatic system in drug distribution, and the involvement of tissues as sites of elimination (through catabolism and target mediated drug disposition) are unique features of antibody distribution and elimination that differ from small molecules, which are commonly distributed into the tissues but are eliminated primarily by liver metabolism. Fundamental differences exist in the ability to predict human pharmacokinetics based upon preclinical data due to differing mechanisms governing small and large molecule disposition."

According to the news reporters, the research concluded: "These differences have influence on the evolving utilization of PBPK modeling in the discovery and development of small and large molecule therapeutics."

For more information on this research see: Physiologically based pharmacokinetic models of small molecules and therapeutic antibodies: a mini-review on fundamental concepts and applications. *Biopharmaceutics & Drug Disposition*, 2016;37(2):75-92. (Wiley-Blackwell - www.wiley.com/; Biopharmaceutics & Drug Disposition -
Study Data from General Hospital Provide New Insights into Pain (Use of Methadone as an Adjuvant Medication to Low-Dose Opioids for Neuropathic Pain in the Frail Elderly: A Case Series)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Neurologic Manifestations - Pain. According to news reporting originating in Toronto, Canada, by NewsRx journalists, research stated, "Palliative care clinicians are increasingly involved in the care of elderly patients suffering from chronic malignant and nonmalignant illnesses, of which neuropathic pain is a prevalent problem. As a person becomes more frail, pain medications such as opioid analgesics and adjuvant pain medications can result in unwanted effects such as sedation, confusion, and increased risk of falls."

The news reporters obtained a quote from the research from General Hospital, "Treating pain in patients with advanced dementia or neurodegenerative diseases that can affect swallowing is particularly challenging because most adjuvant pain medications used to ameliorate neuropathic pain must be taken orally. Furthermore, dosing of neuropathic medications is limited by renal function, which is often impaired in the elderly due to both normal aging and renal disease. Methadone is an opioid analgesic that is effective in the treatment of neuropathic pain, is excreted by the bowels, is highly lipophilic, and can be administered through the oral, buccal, or sublingual routes."

According to the news reporters, the research concluded: "We present three cases highlighting the use of low-dose adjuvant methadone to manage complex neuropathic pain in the frail elderly."

Our news correspondents report that additional information may be obtained by contacting D. Grossman, North York Gen Hosp, Freeman Center Adv Palliat Care, Toronto, ON

Hepatosteatosis

Study Data from George Washington University Update Knowledge of Hepatosteatosis (Protective Role of Dietary Curcumin in the Prevention of the Oxidative Stress Induced by Chronic Alcohol with respect to Hepatic Injury and Antiatherogenic Markers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hepatosteatosis are presented in a new report. According to news reporting out of Washington, District of Columbia, by NewsRx editors, research stated, "Curcumin, an antioxidant compound found in Asian spices, was evaluated for its protective effects against ethanol-induced hepatosteatosis, liver injury, antiatherogenic markers, and antioxidant status in rats fed with Lieber-deCarli low menhaden (2.7% of total calories from o-3 polyunsaturated fatty acids (PUFA)) and Lieber-deCarli high menhaden (13.8% of total calories from o-3 PUFA) alcohol-liquid (5%) diets supplemented with or without curcumin (150 mg/kg/day) for 8 weeks. Treatment with curcumin protected against high o-3 PUFA and ethanol-induced hepatosteatosis and increase in liver injury markers, alanine aminotransferase, and aspartate aminotransferase."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from George Washington University, "Curcumin upregulated paraoxonase 1 (PON1) mRNA and caused significant increase in serum PON1 and homocysteine thiolactonase activities as compared to high o-3 PUFA and ethanol group. Moreover, treatment with curcumin protected against ethanol-induced oxidative stress by increasing the antioxidant glutathione and decreasing the lipid peroxidation adduct 4-hydroxynonenal. These results strongly suggest that chronic ethanol in combination with high o-3 PUFA exacerbated hepatosteatosis and liver injury and adversely decreases antiatherogenic markers due to increased oxidative stress and depletion of glutathione. Curcumin supplementation significantly prevented these deleterious actions of chronic ethanol and high o-3 PUFA."

According to the news editors, the research concluded: "Therefore, we conclude that curcumin may have therapeutic potential to protect against chronic alcohol-induced liver injury and atherosclerosis."

For more information on this research see: Protective Role of Dietary Curcumin in the Prevention of the Oxidative Stress Induced by Chronic Alcohol with respect to Hepatic Injury and Antiatherogenic Markers. Central Nervous System Diseases and Conditions...

Study Data from Harbin Medical University Update Understanding of Cerebral Hemorrhage [Cerebroprotection by the neuronal PGE(2) receptor EP2 after intracerebral hemorrhage in middle-aged mice]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Central Nervous System Diseases and Conditions - Cerebral Hemorrhage are discussed in a new report. According to news originating from Harbin, People's Republic of China, by NewsRx correspondents, research stated, "Inflammatory responses mediated by prostaglandins such as PGE(2) may contribute to secondary brain injury after intracerebral hemorrhage (ICH). However, the cell-specific signaling by PGE(2) receptor EP2 differs depending on whether the neuropathic insult is acute or chronic."

Our news journalists obtained a quote from the research from Harbin Medical University, "Using genetic and pharmacologic approaches, we investigated the role of EP2 receptor in two mouse models of ICH induced by intrastriatal injection of collagenase or autologous arterial whole blood. We used middle-aged male mice to enhance the clinical relevance of the study. EP2 receptor was expressed in neurons but not in astrocytes or microglia after collagenase-induced ICH. Brain injury after collagenase-induced ICH was associated with enhanced cellular and molecular inflammatory responses, oxidative stress, and matrix metalloproteinase (MMP)-2/9 activity. EP2 receptor deletion exacerbated brain injury, brain swelling/edema, neuronal death, and neurobehavioral deficits, whereas EP2 receptor activation by the highly selective agonist AE1-259-01 reversed these outcomes. EP2 receptor deletion also exacerbated brain edema and neurologic deficits in the blood ICH model. These findings support the premise that neuronal EP2 receptor activation by PGE(2) protects brain against ICH injury in middle-aged mice through its anti-inflammatory and anti-oxidant effects and anti-MMP-2/9 activity."

According to the news editors, the research concluded: "PGE(2)/EP2 signaling warrants further investigation for potential use in ICH treatment."

For more information on this research see: Cerebroprotection by the neuronal PGE (2) receptor EP2 after intracerebral hemorrhage in middle-aged mice. Journal of Cerebral
Study Data from Harbin Medical University Update Understanding of Phenols (Effects of Propofol on Several Membrane Characteristics of Cervical Cancer Cell Lines)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Phenols have been presented. According to news originating from Harbin, People's Republic of China, by NewsRx correspondents, research stated, "Although significant advances have been made toward understanding the molecular mechanisms underlying the effect of propofol on tumor cell metastasis, less is known regarding how cell membrane and cytoskeletal ultrastructure are affected in this process. Here, we investigated the relationship between cell morphology and cell size, which are features mainly defined by the cytoskeleton."

Our news journalists obtained a quote from the research from Harbin Medical University, "To confirm the effects of propofol on the migratory ability of human cervical carcinoma cells, cell migration and invasion were examined through scratch wound healing and transwell membrane assays. Furthermore, HeLa cells cultivated with different concentrations of propofol were examined by confocal microscopy and atomic force microscopy (AFM), and the mean optical density and migration ability of these cells were also assessed. In addition, cell membrane morphology was inspected using AFM. The results of the wound healing and transwell membrane assays indicated that propofol decreases the migratory ability of cervical carcinoma cells compared to control cells. A comparative analysis of the test results revealed that short-term (3 h) exposure to propofol induced marked changes in cell membrane microstructure and in the cytoskeleton in a dose dependent manner. These morphological changes in the cell membrane were accompanied by cytoskeleton (F-actin) derangement. The present findings demonstrate a close relationship between changes in cell membrane ultrastructure and cytoskeletal alterations (F-actin) in propofol-treated HeLa cells. AFM scanning analysis showed that cell membrane ultrastructure was significantly changed, including a clear reduction in membrane roughness. The influence of propofol on the HeLa cell cytoskeleton can be directly reflected by changes in cellular morphology, as assessed by AFM."

According to the news editors, the research concluded: "Moreover, the use of AFM..."
is a good method for investigating propofol-mediated changes within cytoskeletal ultrastructure."

For more information on this research see: Effects of Propofol on Several Membrane Characteristics of Cervical Cancer Cell Lines. *Cellular Physiology and Biochemistry*, 2016;40(1-2):172-182. *Cellular Physiology and Biochemistry* can be contacted at: Karger, Allschwilerstrasse 10, Ch-4009 Basel, Switzerland. **Heart Disorders and Diseases - Ventricular Fibrillation**

**Study Data from Hiroshima University Provide New Insights into Ventricular Fibrillation (Risk stratification of ventricular fibrillation in Brugada syndrome using noninvasive scoring methods)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Ventricular Fibrillation are presented in a new report. According to news originating from Hiroshima, Japan, by NewsRx correspondents, research stated, "Risk stratification for ventricular fibrillation (VF) in patients with Brugada syndrome (BrS) remains controversial. The purpose of this study was to construct a novel prediction model for VF risk in BrS patients using noninvasive parameters."

Our news journalists obtained a quote from the research from Hiroshima University, "A total of 143 Japanese BrS patients with VF (n=35) and without VF (n=108) were retrospectively enrolled. We built a logistic regression model predicting VF occurrence and evaluated it by cross-validation. Frequencies of history of syncope and spontaneous type 1 ECG, r-J interval in V-1, QRS duration in V-6, and LAS(40), Tpeak-Tend dispersion, and max T-wave alternans were significantly associated with VF occurrence in univariate analyses. The history of syncope, r-J interval in V-1, QRS duration in V-6, and Tpeak-Tend dispersion were identified as independent predictors by multivariate logistic regression analysis. The predictive model was constructed using all these parameters with good discrimination of VF occurrence (area under the curve 0.869 with 97.1% sensitivity and 65.7% specificity). The area under the curve based on leave-one-out cross validation was 0.845, with 97.1% sensitivity and 63.0% specificity suggesting good performance of the model. Retrospective survival analysis revealed that the cumulative VF event rate was significantly higher in patients at high risk than in those with low risk using the log rank test (P = 2.97 x 10(-8)). Notably, no BrS patient below the
cutoff value developed a subsequent VF event."

According to the news editors, the research concluded: "This novel prediction method may effectively assesses VF risk in BrS patients, especially when determining implantable cardioverter-defibrillator placement for asymptomatic BrS patients."

The news correspondents report that additional information may be obtained from Y. Nakano, Hiroshima University, Grad Sch Biomed & Hlth Sci, Dept. of Cardiovasc Med, Hiroshima, Japan. Additional authors for this research include Y. Nakano, H. Ochi, M. Takagi, Y. Hayashi, Y. Uchimura, T. Tokuyama, Y. Watanabe, H. Matsumura, S. Tomomori, A. Sairaku, K. Soenari, A. Awazu, Y. Miwa, K. *Study Data from Hong Kong Eye Hospital Update Understanding of Diabetic Angiopathies (Associations between diabetic retinopathy and systemic risk factors)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Diabetic Angiopathies is the subject of a report. According to news originating from Hong Kong, People's Republic of China, by NewsRx correspondents, research stated, "Diabetes mellitus is a systemic disease with complications that include sight-threatening diabetic retinopathy. It is essential to understand the risk factors of diabetic retinopathy before effective prevention can be implemented."

Our news journalists obtained a quote from the research from Hong Kong Eye Hospital, "The aim of this review was to examine the association between diabetic retinopathy and systemic risk factors. A PubMed literature search was performed up to May 2016 to identify articles reporting associations between diabetic retinopathy and systemic risk factors; only publications written in English were included. Relevant articles were selected and analysed. Patients with diabetic retinopathy were more likely to have poor glycaemic control as reflected by a higher glycated haemoglobin, longer duration of diabetes, and use of insulin therapy for treatment. For other systemic risk factors, hypertension was positively associated with..."
prevalence and progression of diabetic retinopathy. No clear association between obesity, hyperlipidaemia, gender, or smoking with diabetic retinopathy has been established as studies reported inconsistent findings. Myopia was a protective factor for the development of diabetic retinopathy. Several genetic polymorphisms were also found to be associated with an increased risk of development of diabetic retinopathy."

According to the news editors, the research concluded: "Good glycaemic and blood pressure control remain the most important modifiable risk factors to reduce the risk of progression of diabetic retinopathy and vision loss."

For more information on this research see: Associations between diabetic retinopathy and systemic risk factors. *Hong Kong Medical Journal*, 2016;22(6):589-599. *Hong Kong Medical Journal* can be contacted at: Hong Kong Acad Medicine Press, 9, F, Room 901, 99 Wong Chuk Hang Rd, Aberdeen, Hong Kong, 00000, Peoples R China.

The news correspondents report that additional information may be obtained from R.L.M. Wong, Hong Kong Eye Hosp. Hong Kong, Hong Kong, People's Republic of China. Additional authors for this research include R.L.M. Wong and I.Y.H. Wong.

**Drugs and Therapies - Antibiotics**

**Study Data from Huazhong Agricultural University Provide New Insights into Antibiotics (Characterization of Spectinomycin Resistance in Streptococcus suis Leads to Two Novel Insights into Drug Resistance Formation and Dissemination Mechanism)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antibiotics are presented in a new report. According to news reporting originating in Wuhan, People's Republic of China, by NewsRx journalists, research stated, "Spectinomycin is an aminocyclitol antibiotic used clinically to treat a variety of infections in animals."

The news reporters obtained a quote from the research from Huazhong Agricultural University, "Here, we characterized drug resistance prevalence in clinical Streptococcus suis isolates and discovered a novel resistance mechanism in which the s5 mutation (Gly26Asp) results in high spectinomycin resistance."

According to the news reporters, the research concluded: "Additionally, a novel integrative and conjugative element encompassing a multidrug resistance spw_like-aadE-lnu (B)-Isa(E) cluster and a cadmium resistance operon were identified, suggesting a possible cause for the wide dissemination of spectinomycin resistance in S. suis."

For more information on this research see: Characterization of Spectinomycin Resistance in Streptococcus suis Leads to Two Novel Insights into Drug Resistance Formation and Dissemination Mechanism. *Antimicrobial Agents and Chemotherapy*, 2016;60(10):6390-6392. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology,
Study Data from I.P. Chatziralli and Colleagues Update Understanding of Macular Edema (Hyperreflective Foci As An Independent Visual Outcome Predictor In Macular Edema Due To Retinal Vascular Diseases Treated With Intravitreal Dexamethasone Or ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Eye Diseases and Conditions - Macular Edema have been presented. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "To evaluate the potential role of hyperreflective foci (HF) in predicting visual outcome in patients undergoing treatment for macular edema due to retinal vascular diseases. Data and images of 92 patients with macular edema due to diabetes mellitus or branch retinal vein occlusion, treated with either intravitreal dexamethasone implant or ranibizumab, were analyzed."

The news reporters obtained a quote from the research, "All patients underwent best-corrected visual acuity measurement, slit-lamp examination, spectral domain optical coherence tomography at baseline and at all time points of the follow-up (Month 1, 2, 3, 6, and 9). Generalized least squares random effects linear or logistic regression analysis was used to investigate potential factors associated with the final best-corrected visual acuity and number of HF, respectively. Increasing age (P < 0.001), central retinal thickness (P < 0.001), number of HF (P = 0.028), presence of subretinal fluid (P < 0.001), intraretinal fluid (P < 0.001), intraretinal cysts (P < 0.001), and disruption of ellipsoid zone/external limiting membrane (P < 0.001) were significantly associated with poorer visual outcome. Factors associated with HF were increasing central retinal thickness (P = 0.003), presence of subretinal fluid (P = 0.049), intraretinal fluid (P = 0.002), cysts (P = 0.015), and disruption of ellipsoid zone (P = 0.047). No significant differences in change in best-corrected visual acuity, central retinal thickness, and HF were observed between the two treatment groups. Hyperreflective foci are associated with poorer visual outcome in patients with macular edema due to retinal vascular diseases."

According to the news reporters, the research concluded: "Similar reductions in HF are achieved by intravitreal steroid and anti-vascular endothelial growth factor agent."

For more information on this research see: Hyperreflective Foci As An Independent Visual Outcome Predictor In Macular Edema Due To Retinal Vascular Diseases Treated With Intravitreal Dexamethasone Or Ranibizumab. Retina-The Journal of Retinal and Vitreous Diseases, 2016;36(12):2319-2328. Retina-The Journal of Retinal and Vitreous Diseases can be
Study Data from INPA Provide New Insights into Cutaneous Leishmaniasis [Topical treatment of experimental cutaneous leishmaniasis in golden hamster (Mesocricetus auratus) with formulations containing pentamidine]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Parasitic Diseases and Conditions - Cutaneous Leishmaniasis. According to news reporting originating from Amazonas, Brazil, by NewsRx correspondents, research stated, "Current treatment of cutaneous leishmaniasis (CL) relies mainly on pentavalent antimonials salts and second-line drugs include pentamidine and amphotericin B, but these therapies have side effects and require parenteral administration. The aim of this work was to evaluate the topical formulations containing pentamidine isethionate (PI) in the experimental treatment of cutaneous leishmaniasis (CL)."

Our news editors obtained a quote from the research from INPA, "Golden hamsters (Mesocricetus auratus) were infected in the nose with Leishmania (Leishmania) amazonensis. Six treatment groups received different topical treatments of anhydrous or hydrating emulsions, for a maximum of 10 days, with an application of 50 mg day(-1). After treatment tissue samples of lesions were evaluated by histology, transmission electron microscopy and biopsy cultivation. Compared with untreated group, topical treatment with hydrating emulsion with 10% PI and usnic acid (ACE5AU) showed significantly decrease in volume lesion (P= 0.028) on 20th day after the end of the treatment with reduction of 27.37%. Topical treatment with anhydrous emulsion with 10% PI and usnic acid (ACPU) reduces parasite burden in Golden hamsters."

According to the news editors, the research concluded: "This study demonstrated the potential of topical treatment to reduce the number of parasites that could be combined with others drugs and to have a faster and more effective treatment of cutaneous leishmaniasis."

The news editors report that additional information may be obtained by contacting C.D. Comandolli-Wyrepkowski, INPA, Lab Leishmaniasis & Chagas Dis, BR-69067375 Manaus, Amazonas, Brazil. Additional authors for this research include I. Grafova, M.D. Naiff,

Drugs and Therapies - Chemotherapy

Study Data from Indiana University Provide New Insights into Chemotherapy (2016 updated MASCC/ESMO consensus recommendations: prevention of nausea and vomiting following multiple-day chemotherapy, high-dose chemotherapy, and breakthrough nausea ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Chemotherapy have been published. According to news reporting originating in Indianapolis, Indiana, by NewsRx journalists, research stated, "This review summarizes the recommendations for the prophylaxis of acute and delayed nausea and vomiting induced by multiple-day chemotherapy, high-dose chemotherapy, and breakthrough nausea and vomiting as agreed at the MASCC/ESMO Antiemetic Guidelines update meeting in Copenhagen in June 2015. A systematic literature search using PubMed from January 01, 2009 through January 06, 2015 with a restriction to papers in English was conducted."

The news reporters obtained a quote from the research from Indiana University, "There were three phase III randomized trials in patients undergoing high-dose chemotherapy and stem cell transplant and eight single arm non-randomized clinical studies (single in patients undergoing transplantation and one in patients receiving multiple-day chemotherapy treatment). We used a total of two randomized clinical trials in this guideline update. For patients receiving treatment for breakthrough chemotherapy-induced nausea and vomiting, a phase III randomized trial investigating the use of olanzapine versus metoclopramide in patients receiving highly emetogenic chemotherapy and a second single arm study looking at the effectiveness of olanzapine were identified. It was concluded that for patients receiving high-dose chemotherapy with stem cell transplant, a combination of a 5-HT3 receptor antagonist with dexamethasone and apreptitant (125 mg orally on day 1 and 80 mg orally on days 2 to 4) is recommended before chemotherapy. For patients undergoing multiple-day chemotherapy-induced nausea and vomiting, a 5-HT3 receptor antagonist, dexamethasone, and apreptitant, are recommended before chemotherapy for the prophylaxis of acute emesis and delayed emesis. For patients experiencing breakthrough nausea and vomiting, the available evidence suggests the use of 10 mg oral olanzapine, daily for 3 days."

According to the news reporters, the research concluded: "Mild to moderate sedation in this patient population (especially elderly patients) is a potential problem with this agent."
For more information on this research see: 2016 updated MASCC/ESMO consensus recommendations: prevention of nausea and vomiting following multiple-day chemotherapy, high-dose chemotherapy, and breakthrough nausea and vomiting. Connective Tissue Cells

Study Data from Inner Mongolia University Update Understanding of Connective Tissue Cells (Isolation and characterization of white and brown adipocytes in Kunming mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Connective Tissue Cells have been presented. According to news reporting originating from Hohhot, People's Republic of China, by NewsRx correspondents, research stated, "White adipose tissue and brown adipose tissue play critical roles in controlling energy homeostasis and the development of obesity and diabetes. We isolated mouse white adipocytes from inguinal white fat tissues and brown adipocytes from interscapular brown fat tissues, and employed a variety of approaches, including immunofluorescent staining, quantitative real-time PCR, western blotting analysis, and differentiation assay, to characterize those adipocytes."

Our news editors obtained a quote from the research from Inner Mongolia University, "Both white and brown adipocytes stained positively for CD44 and CD29, and lipid droplets were observed after the induction of adipogenesis. The Asc1 expression level in the white adipocytes was 2.5-fold higher than that in the brown adipocytes (p <0.05), and the expression of Ucp1 in the white adipocytes was approximately 50% of that in the brown adipocytes (p <0.05). The expression of a-tubulin in the brown adipocytes was approximately 70% of that in the white adipocytes. The brown adipocytes had a higher Cidea mRNA level (p <0.05) and a lower Pparg mRNA level (p <0.05) than the white adipocytes."

According to the news editors, the research concluded: "The results demonstrate that white and brown adipocytes have different gene expression signatures, and may represent two useful cell models to study the mechanisms involved in obesity."

For more information on this research see: Isolation and characterization of white and brown adipocytes in Kunming mice. Genetics and Molecular Research [electronic...

Genetics - Medical Genetics

Study Data from Institute for Cancer Research and Treatment (IRCCS) Update Knowledge of Medical Genetics [Sprengel anomaly in deletion 22q11.2 (DiGeorge/Velo-Cardio-Facial) syndrome]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Genetics - Medical Genetics are discussed in a new report. According to news reporting from Rome, Italy, by NewsRx journalists, research stated, "Sprengel anomaly (SA) is a rare skeletal defect characterized by uni-or bi-lateral elevation of the scapula. This anomaly is often isolated, although it can occur in association with other defects, including cervical spine malformations, cleft palate, and facial anomalies."

The news correspondents obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "Neural crest migration anomalies have been involved in the etiology of SA. Since the same embryological pathway accounts for some of the clinical features of deletion 22q11.2 syndrome (del22q11.2; DiGeorge/Velo-Cardio-Facial syndrome), we investigated the occurrence of SA in a consecutive series of 235 del22q11.2 patients aged more than 2 years, undergoing a complete clinical and orthopedic assessment of the dorsal and thoracic skeleton. In the present series, two patients were diagnosed with true SA. Present results and published reports suggest that scapular involvement including SA occurs in 1-2% of del22q11.2 individuals."

According to the news reporters, the research concluded: "Accordingly, this anomaly should be investigated as one of the possible skeletal findings of del22q11.2 syndrome, while this diagnosis should be excluded in patients presenting with SA associated with other defects."

Our news journalists report that additional information may be obtained by contacting F.C. Radio, Medical Genetic Unit and Laboratory of Medical Genetics, Bambino Gesu Pediatric Hospital, IRCCS, Rome, Italy. Additional authors for this research include M.C. Digilio, R. Capolino, M.L. Dentici, M. Unolt, V. Alesi, A. Novelli, B. Marino and B. Dallapiccola.

Nematodes

Study Data from K.S. Kim and Colleagues Update Understanding of Nematodes (Advancements in breeding, genetics, and genomics for resistance to three nematode species in soybean)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nematodes have been published. According to news reporting originating from Daejeon, South Korea, by NewsRx correspondents, research stated, "Integration of genetic analysis, molecular biology, and genomic approaches drastically enhanced our understanding of genetic control of nematode resistance and provided effective breeding strategies in soybeans. Three nematode species, including soybean cyst (SCN, Heterodera glycine), root-knot (RKN, Meloidogyne incognita), and reniform (RN, Rotylenchulus reniformis), are the most destructive pests and have spread to soybean growing areas worldwide."

Financial supporters for this research include The United Soybean Board, Missouri Soybean Merchandising Council.

Our news editors obtained a quote from the research, "Host plant resistance has played an important role in their control. This review focuses on genetic, genomic studies, and breeding efforts over the past two decades to identify and improve host resistance to these three nematode species. Advancements in genetics, genomics, and bioinformatics have improved our understanding of the molecular and genetic mechanisms of nematode resistance and enabled researchers to generate large-scale genomic resources and marker-trait associations. Whole-genome resequencing, genotyping-by-sequencing, genome-wide association studies, and haplotype analyses have been employed to map and dissect genomic locations for nematode resistance. Recently, two major SCN-resistant loci, Rhg1 and Rhg4, were cloned and other novel resistance quantitative trait loci (QTL) have been discovered. Based on these discoveries, gene-specific DNA markers have been developed for both Rhg1 and Rhg4 loci, which were useful for marker-assisted selection. With RKN resistance QTL being mapped, candidate genes responsible for RKN resistance were identified, leading to the development of functional single nucleotide polymorphism markers. So far, three resistances QTL have been genetically mapped for RN resistance."

According to the news editors, the research concluded: "With nematode species overcoming the host plant resistance, continuous efforts in the identification and deployment of new resistance genes are required to support the development of soybean cultivars with multiple and durable resistance to these pests."

For more information on this research see: Advancements in breeding, genetics, and genomics for resistance to three nematode species in soybean. Theoretical and Applied Genetics, 2016;129(12):2295-2311. Theoretical and Applied Genetics can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA.

Oncology - Breast Cancer

Study Data from Kaohsiung Medical University Provide New Insights into Breast Cancer (Gallic acid-capped gold nanoparticles inhibit EGF-induced MMP-9 expression through suppression of p300 stabilization and NF kappa B/c-Jun activation in breast ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Breast Cancer are discussed in a new report. According to news originating from Kaohsiung, Taiwan, by NewsRx correspondents, research stated, "Triple-negative breast cancers (TNBCs) are highly invasive and have a higher rate of distant metastasis. Matrix metalloproteinase-9 (MMP-9) plays a crucial role in EGF/EGFR-mediated malignant progression and metastasis of TNBCs."

Our news journalists obtained a quote from the research from Kaohsiung Medical University, "Various studies have revealed that treatment with gallic acid down-regulates MMP-9 expression in cancer cells, and that conjugation of phytochemical compounds with gold nanoparticles (AuNPs) increases the anti-tumor activity of the phytochemical compounds. Thus, the effect of gallic acid-capped AuNPs (GA-AuNPs) on MMP-9 expression in EGF-treated TNBC MDA-MB-231 cells was analyzed in the present study. The so-called green synthesis of AuNPs by means of gallic acid was performed at pH 10, and the resulting GA-AuNPs had spherical shape with an average diameter of approximately 50 nm. GA-AuNPs notably suppressed migration and invasion of EGF-treated cells, and inhibited EGF-induced MMP-9 up-regulation. GA-AuNPs abrogated EGF-induced Akt/p65 and ERK/c-Jun phosphorylation, leading to down-regulation of MMP-9 mRNA and protein expression in EGF-treated cells. Meanwhile, EGF-induced p300 stabilization was found to be involved in MMP-9 expression, whereas GA-AuNPs inhibited the EGF-promoted stability of the p300 protein. Although GA-AuNPs and gallic acid suppressed EGF-induced MMP-9 up-regulation via the same signaling pathway, the effective concentration of gallic acid was approximately 100-fold higher than that of GA-AuNPs for inhibition of MMP-9 expression in EGF-treated cells to a similar extent. Collectively, our data indicate that, in comparison with gallic acid, GA-AuNPs have a superior ability to inhibit EGF/EGFR-mediated MMP-9 expression in TNBC MDA-MB-231 cells."

According to the news editors, the research concluded: "Our findings also point to a way to improve the anti-tumor activity of gallic acid."

For more information on this research see: Gallic acid-capped gold nanoparticles inhibit EGF-induced MMP-9 expression through suppression of p300 stabilization and NF

**Quality of Life**

**Study Data from Karolinska University Hospital Update Knowledge of Quality of Life (Health-related quality of life 10 years after oesophageal cancer surgery)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Quality of Life is the subject of a report. According to news originating from Stockholm, Sweden, by NewsRx correspondents, research stated, "To determine whether oesophageal cancer survivors recover in health-related quality of life (HRQOL) within 10 years of surgery. A prospective, nationwide, population-based cohort study including 90% of all oesophageal cancer surgery patients in Sweden in 2001-2005, with follow-up through 2015."

Our news journalists obtained a quote from the research from Karolinska University Hospital, "HRQOL was assessed 5 and 10 years postoperatively, using questionnaires for cancer in general (EORTC QLQ-C30) and oesophageal cancer specifically (EORTC QLQ-OES18). The HRQOL measures at 10 years after surgery were compared with the 5-year assessment. The 10-year HRQOL scores were compared with a population-based reference population (4910 individuals), individually matched for age, sex and comorbidity, by means of mean score differences with 95% confidence intervals. Among 616 patients, 104 (17%) survived at least 10 years. Of these, 92 (88%) responded to the HRQOL questionnaires at 5 and 10 years after surgery. Among the responders, 71% were older than 70 years. Patients did not improve in HRQOL between 5 and 10 years. Instead, the scores for 23 out of 25 HRQOL aspects declined, with clinically relevant and statistically significant deterioration in role function and appetite loss. Compared to the reference population, the 10-year-survivors had worse scores in all 25 HRQOL aspects, with significant deterioration in global quality of life, role functioning, social functioning and most symptoms. The most severe problems compared to the reference population were reflux, eating difficulties, diarrhoea and appetite loss."

According to the news editors, the research concluded: "Patients who have undergone curative treatment for oesophageal cancer experience reduced HRQOL with persisting symptoms 10 years after surgery."

The news correspondents report that additional information may be obtained from A. Schandl, Karolinska Inst, Surg Care Sci, Dept. of Mol Med & Surg, Karolinska Univ Hosp, S-17176 Stockholm, Sweden. Additional authors for this research include J. Lagergren, A. Johar and P. Lagergren.

Heart Disorders and Diseases - Dilated...

**Study Data from Kitasato University Update Knowledge of Dilated Cardiomyopathy (Clinical significance of endomyocardial biopsy in conjunction with cardiac magnetic resonance imaging to predict left ventricular reverse remodeling in idiopathic ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Dilated Cardiomyopathy have been presented. According to news reporting originating from Sagamihara, Japan, by NewsRx correspondents, research stated, "Endomyocardial biopsy (EMB) and cardiac magnetic resonance (CMR) are useful modalities to study the characteristics of myocardial tissue. However, the prognostic impact of both diagnostic tools to predict subsequent left ventricular reverse remodeling (LVRR) has not been well elucidated."

Our news editors obtained a quote from the research from Kitasato University, "A total of 187 consecutive patients with idiopathic dilated cardiomyopathy (IDCM) who were treated by optimal pharmacotherapy (OPT) and underwent EMB of the LV wall were investigated. The myocardial specimens were semiquantitatively evaluated measuring cardiomyocyte degeneration (CD), interstitial fibrosis (IF), and hypertrophy. In addition, late gadolinium enhancement (LGE)-CMR was performed in 78 (48 %) patients. Seventy-eight (48 %) patients developed LVRR, defined as a ae <yen >10 % increase in LV ejection fraction with a ae <yen >10 % decrease in indexed LV end-diastolic dimension at 12 months after OPT. Multivariate regression analysis revealed that CD (P = 0.003), but not IF (P = 0.320), was an independent predictor of LVRR. In the patients with not only EMB but also CMR, the CD score and LGE area were independent predictors of LVRR (odds ratios/P values 0.268/0.010, 0.855/ < 0.001, respectively). The patients with mild CD and negative LGE had a better achievement rate of LVRR than those with severe CD and positive LGE (74 vs. 19 %)."

According to the news editors, the research concluded: "A combination of CD score on EMB and LGE-CMR is useful to predict subsequent LVRR in IDCM patients."

**Nutritional and Metabolic Diseases and Conditions -**

**Study Data from Klinikum Coburg GmbH Update Knowledge of Iron-Deficiency Anemia (A prospective observational study of effectiveness and safety of iron isomaltoside in patients with chronic renal failure and iron deficiency anemia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Iron-Deficiency Anemia have been published. According to news reporting out of Coburg, Germany, by NewsRx editors, research stated, "The aim of this study was to investigate the effectiveness, safety, and tolerability of iron isomaltoside in routine practical care of iron deficiency anemia (IDA) in patients with chronic renal failure. The study included 698 patients with IDA on dialysis or with nondialysis chronic kidney disease (CKD) stages 3 - 5 designated by their physicians for treatment with iron isomaltoside."

Our news journalists obtained a quote from the research from Klinikum Coburg GmbH, "Data were recorded at baseline and after 3 and 9 months. Effectiveness data included measurement of hemoglobin (Hb), hematocrit, s-iron, transferrin saturation (TSAT), and s-ferritin. Safety data included adverse events and safety laboratory variables. Following administration of a mean cumulative dose of 2,574 mg isomaltoside over 9 months, initial average Hb increased from 11.0 g/dL to 11.6 g/dL, TSAT from 19.4% to 28.3%, and s-ferritin from 320 mu g/L to 642 mu g/L, demonstrating a positive effect of iron isomaltoside on iron deficiency. In addition, there was a significant reduction in the use of erythropoiesis-stimulating agents (ESAs) (regarding epoetin a, initial mean dose 40,688 IU/month, final dose 35,665 IU/month, -13.7%, p< 0.001). No drug-related adverse events were reported. Furthermore, safety parameters including s-phosphate indicated no abnormal changes."

According to the news editors, the research concluded: "Iron isomaltoside
demonstrated very good effectiveness and tolerability in patients with stage 3 - 5 CKD, including an ESA saving effect."

For more information on this research see: A prospective observational study of effectiveness and safety of iron isomaltoside in patients with chronic renal failure and iron deficiency anemia. *Clinical Nephrology*, 2016;86(6):310-318. *Clinical Nephrology* can be contacted at: Dustri-Verlag Dr Karl Feistle, Bahnhofstrasse 9 Postfach 49, D-82032 Deisenhofen-Muenchen, Germany.

**Stem Cell Research - Mesenchymal Stem Cells**

**Study Data from Konkuk University Provide New Insights into Mesenchymal Stem Cells (Human adipose mesenchymal stem cell-derived exosomal-miRNAs are critical factors for inducing anti-proliferation signalling to A2780 and SKOV-3 ovarian cancer ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Stem Cell Research - Mesenchymal Stem Cells is the subject of a report. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "An enigmatic question exists concerning the pro-or anti-cancer status of mesenchymal stem cells (MSCs). Despite growing interest, this question remains unanswered, and the debate became intensified with new evidences backing each side."

The news correspondents obtained a quote from the research from Konkuk University, "Here, we showed that human adipose MSC (hAMSC)-derived conditioned medium (CM) exhibited inhibitory effects on A2780 human ovarian cancer cells by blocking the cell cycle, and activating mitochondria-mediated apoptosis signalling. Explicitly, we demonstrated that exosomes, an important biological component of hAMSC-CM, could restrain proliferation, wound-repair and colony formation ability of A2780 and SKOV-3 cancer cells. Furthermore, hAMSC-CM-derived exosomes induced apoptosis signalling by upregulating different pro-apoptotic signalling molecules, such as BAX, CASP9, and CASP3, as well as downregulating the anti-apoptotic protein BCL2. More specifically, cancer cells exhibited reduced viability following fresh or protease-digested exosome treatment; however, treatment with RNase-digested exosomes could not inhibit the proliferation of cancer cells. Additionally, sequencing of exosomal RNAs revealed a rich population of microRNAs (miRNAs), which exhibit anti-cancer activities by targeting different molecules associated with cancer survival. Our findings indicated that exosomal miRNAs are important players involved in the inhibitory influence of hAMSC-CM towards ovarian cancer cells."

According to the news reporters, the research concluded: "Therefore, we believe that
these comprehensive results will provide advances concerning ovarian cancer research and treatment."

For more information on this research see: Human adipose mesenchymal stem cell-derived exosomal-miRNAs are critical factors for inducing anti-proliferation signalling to A2780 and SKOV-3 ovarian cancer cells. Science

Study Data from Korea University Update Knowledge of Science (Measurement of the Nucleus Area and Nucleus/Cytoplasm and Mitochondria/Nucleus Ratios in Human Colon Tissues by Dual-Colour Two-Photon Microscopy Imaging)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Science have been published. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "We developed two-photon (TP) probes for DNA (ABI-Nu), cytoplasm (Pyr-CT), and mitochondria (BF-MT). We found that ABI-Nu binds to AT in the minor groove, while ABI-Nu and BF-MT are effective for tracking in the cytoplasm and mitochondria, respectively."

Our news editors obtained a quote from the research from Korea University, "These probes showed very large effective two-photon action cross section values of 2230, 1555, and 790 G?ppert-Mayer units (1 GM=10(-50) cm(4) s photon(-1) molecule(-1)) at 740 nm with emission maxima at 473, 561, and 560 nm, respectively, in each organelle. Using these probes, we quantitatively estimated the mean nuclear area and the ratios of nuclei to cytoplasm and mitochondria to nuclei in human colon tissues by dual-colour two-photon microscopy imaging within 2 h after biopsy. The mean nuclear area and the nuclei to cytoplasm and mitochondria to cytoplasm ratios increased in the following order: normal colon mucosa <colon adenoma <colon adenocarcinoma."

According to the news editors, the research concluded: "Furthermore, the nuclear areas of these tissues showed significant differences that were well outside of the ranges of experimental errors, indicating the diagnostic potential of this method."

For more information on this research see: Measurement of the Nucleus Area and Nucleus/Cytoplasm and Mitochondria/Nucleus Ratios in Human Colon Tissues by Dual-Colour Two-Photon Microscopy Imaging. Scientific Reports, 2015;5():18521. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Oncology - Breast Cancer

Study Data from Kumamoto University Update Knowledge of Breast Cancer (Prognostic role of PIK3CA mutations of cell-free DNA in early-stage triple negative breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Breast Cancer. According to news reporting originating in Kumamoto, Japan, by NewsRx journalists, research stated, "PIK3CA is an oncogene that encodes the p110a component of phosphatidylinositol 3-kinase (PI3K); it is the second most frequently mutated gene following the TP53 gene. In the clinical setting, PIK3CA mutations may have favorable prognostic value for hormone receptor-positive breast cancer patients and, during the past few years, PIK3CA mutations of cell-free DNA (cfDNA) have attracted attention as a potential noninvasive biomarker of cancer."

The news reporters obtained a quote from the research from Kumamoto University, "However, there are few reports on the clinical implications of PIK3CA mutations for TNBC patients. We investigated the PIK3CA major mutation status of cfDNA as a noninvasive biomarker of cancer using droplet digital polymerase chain reaction (ddPCR), which has high level sensitivity and specificity for cancer mutation, in early-stage 49 triple negative breast cancer (TNBC) patients. A total of 12 (24.4%) of 49 patients had PIK3CA mutations of cfDNA. In a median follow up of 54.4 months, the presence of PIK3CA mutations of cfDNA had significant impacts on relapse-free survival (RFS; p=0.0072) and breast cancer-specific survival (BCSS; p=0.016), according to the log-lank test. In a Cox proportional hazards model, the presence of PIK3CA mutations of cfDNA had significant prognostic value in the univariate and multivariate analysis. Additionally, the presence of PIK3CA mutations of cfDNA was significantly correlated with positive androgen receptor phosphorylated form depending on PI3K signaling pathway (pAR) which is independent favorable prognostic factors of TNBC."

According to the news reporters, the research concluded: "We demonstrated that the presence of PIK3CA major mutations of cfDNA could be a discriminatory predictor of RFS and BCSS in early-stage TNBC patients and it was associated with PI3K pathway-dependent AR phosphorylation."

Our news correspondents report that additional information may be obtained by
contacting T. Takeshita, Dept. of Breast and Endocrine surgery, Graduate School of Medical Science, Kumamoto University, Kumamoto, Japan. Additional authors for this research include Y. Yamamoto, M. Yamamoto-Ibusuki, T. Inao, A. Sueta, S. Fujiwara, Y. Omoto and H. Iwase.

Glycoconjugates

Study Data from Kyung Hee University Update Understanding of Glycoconjugates [Decursin in Angelica gigas Nakai (AGN) Enhances Doxorubicin Chemosensitivity in NCI/ADR-RES Ovarian Cancer Cells via Inhibition of P-glycoprotein Expression]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Glycoconjugates. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "Angelica gigas Nakai (AGN, Korean Dang-gui) is traditionally used for the treatment of various diseases including cancer. Here, we investigated multidrug-resistant phenotype-reversal activities of AGN and its compounds (decursin, ferulic acid, and nodakenin) in doxorubicin-resistant NCI/ADR-RES ovarian cancer cells."

The news reporters obtained a quote from the research from Kyung Hee University, "Our results showed that a combination of doxorubicin with either AGN or decursin inhibited a proliferation of NCI/ADR-RES cells. These combinations increased the number of cells at sub-G1 phase when cells were stained with Annexin V-fluorescein isothiocyanate. We also found that these combinations activated caspase-9, caspase-8, and caspase-3 and increased cleaved PARP level. Moreover, an inhibition of P-glycoprotein expression by either AGN or decursin resulted in a reduction of its activity in NCI/ADR-RES cells. Therefore, our data demonstrate that decursin in AGN inhibits doxorubicin-resistant ovarian cancer cell proliferation and induces apoptosis in the presence of doxorubicin via blocking P-glycoprotein expression."

According to the news reporters, the research concluded: "Therefore, AGN would be a potentially novel treatment option for multidrug-resistant tumors by sensitizing to anticancer agents."

Our news correspondents report that additional information may be obtained by contacting S.G. Ko, Kyung Hee Univ, Dept. of Prevent Med, Coll Korean Med, Seoul 130701, South Korea. Additional authors for this research include S.G. Cho, M.K. Kim, M.S. Kim, S.H. Moon, I.H. Kim and S.G. Ko.
Parkinson's Disease

Study Data from Kyungpook National University Update Knowledge of Parkinson's Disease (Induction of microglial toll-like receptor 4 by prothrombin kringle-2: a potential pathogenic mechanism in Parkinson's disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Parkinson's disease. According to news reporting out of Daegu, South Korea, by NewsRx editors, research stated, "Microglia-mediated neuroinflammation may play an important role in the initiation and progression of dopaminergic (DA) neurodegeneration in Parkinson's disease (PD), and toll-like receptor 4 (TLR4) is essential for the activation of microglia in the adult brain. However, it is still unclear whether patients with PD exhibit an increase in TLR4 expression in the brain, and whether there is a correlation between the levels of prothrombin kringle-2 (pKr-2) and microglial TLR4."

Our news journalists obtained a quote from the research from Kyungpook National University, "In the present study, we first observed that the levels of pKr-2 and microglial TLR4 were increased in the substantia nigra (SN) of patients with PD. In rat and mouse brains, intranigral injection of pKr-2, which is not directly toxic to neurons, led to the disruption of nigrostriatal DA projections. Moreover, microglial TLR4 was upregulated in the rat SN and in cultures of the BV-2 microglial cell line after pKr-2 treatment. In TLR4-deficient mice, pKr-2-induced microglial activation was suppressed compared with wild-type mice, resulting in attenuated neurotoxicity."

According to the news editors, the research concluded: "Therefore, our results suggest that pKr-2 may be a pathogenic factor in PD, and that the inhibition of pKr-2-induced microglial TLR4 may be protective against degeneration of the nigrostriatal DA system in vivo."

For more information on this research see: Induction of microglial toll-like receptor 4 by prothrombin kringle-2: a potential pathogenic mechanism in Parkinson's disease. Scientific Reports, 2015;5():14764. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Oncology - Liver Cancer

Study Data from Kyushu University Update Knowledge of Liver Cancer (Sarcopenia is a poor prognostic factor following hepatic resection in patients aged 70 years and older with hepatocellular carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Liver Cancer is now available. According to news reporting originating from Fukuoka, Japan, by NewsRx correspondents, research stated, "The present study investigated the effect of sarcopenia on short- and long-term surgical outcomes and identified potential prognostic factors for hepatocellular carcinoma (HCC) following hepatectomy among patients 70 years of age and older. Patient data were retrospectively collected for 296 consecutive patients who underwent hepatectomy for HCC with curative intent."

Our news editors obtained a quote from the research from Kyushu University, "Patients were assigned to two groups according to age (younger than 70 years, and 70 years and older), and the presence of sarcopenia. The clinicopathological, surgical outcome, and long-term survival data were analyzed. Sarcopenia was present in 112 of 296 (37.8%) patients with HCC, and 35% of patients aged 70 years and older. Elderly patients had significantly lower serum albumin levels, prognostic nutrition index, percentage of liver cirrhosis, and histological intrahepatic metastasis compared with patients younger than 70 years. Overall survival and disease-free survival rates in patients with sarcopenia correlated with significantly poor prognosis in the group aged 70 years and older. Multivariate analysis revealed that sarcopenia was predictive of an unfavorable prognosis."

According to the news editors, the research concluded: "This retrospective analysis revealed that sarcopenia was predictive of worse overall survival and recurrence-free survival after hepatectomy in patients 70 years of age and older with HCC."

For more information on this research see: Sarcopenia is a poor prognostic factor following hepatic resection in patients aged 70 years and older with hepatocellular carcinoma. Hepatology Research, 2016;46(12):1247-1255. Hepatology Research can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Elsevier - www.elsevier.com; Hepatology Research - www.journals.elsevier.com/hepatology-research/)

The news editors report that additional information may be obtained by contacting T. Yoshizumi, Kyushu University, Dept. of Surg & Sci, Grad Sch Med Sci, Fukuoka, Japan. Heart Disorders and Diseases - Heart Attack

Study Data from L.J. Lambert et al Provide New Insights into Heart Attack (Outcomes of Patients With ST-Elevation Myocardial Infarction Receiving and Not Receiving Reperfusion Therapy: The Importance of Examining All Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news reporting from Montreal, Canada, by NewsRx journalists, research stated, "Hospitals treating patients with ST-elevation myocardial infarction (STEMI) may show good results with reperfusion treatment (fibrinolysis or primary percutaneous coronary intervention [PPCI]), but a comprehensive evaluation should factor in outcomes of patients with STEMI who do not receive reperfusion. We compared outcomes of patients receiving and not receiving reperfusion within a complete system of STEMI care by hospital type: PPCI centres, fibrinolysis centres, centres that only transfer for PPCI, and centres providing a mix of fibrinolysis and PPCI transfer."

The news correspondents obtained a quote from the research, "All patients presenting to 82 Quebec hospitals with characteristic symptoms, a final diagnosis of acute myocardial infarction, and core-laboratory confirmed STEMI over two 6-month periods were studied. Of the total 3731 patients with STEMI, 2918 (78.2%) received reperfusion treatment (81% PPCI, 19% fibrinolysis); 813 (21.8%) did not. For reperfusion-treated patients, 30-day mortality was 5.4% in PPCI centres, 5.4% in fibrinolysis centres, 6.9% in transfer PPCI centres, and 6.0% in mixed centres (P = 0.55). For untreated patients, 30-day mortality was 15.7% (PPCI centres), 16.1% (fibrinolysis centres), 21.8% (transfer PPCI), and 24.6% (mixed) (P = 0.08). Adjusted mortality odds ratios for all patients were 1.00 (PPCI centres), 1.50 (95% CI: 0.97-2.32; fibrinolysis centres), 1.30 (0.95-1.78; transfer PPCI centres), and 1.58 (1.09-2.29; mixed centres). PPCI was within recommended delays in 35.4%, 11.9%, and 1.2% of PPCI, transfer, and mixed centres, respectively. Mixed centres had the highest crude and adjusted all-patient 30-day STEMI mortality."

According to the news reporters, the research concluded: "Relatively good outcomes of reperfusion-treated patients, despite long treatment delays, can misrepresent overall performance if untreated patients are not examined."

Study Data from Leiden University Update Understanding of Osteosarcomas (MEK inhibition induces apoptosis in osteosarcoma cells with constitutive ERK1/2 phosphorylation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Osteosarcomas are presented in a new report. According to news originating from Leiden, Netherlands, by NewsRx correspondents, research stated, "Conventional high-grade osteosarcoma is the most common primary bone cancer with relatively high incidence in young people. Recurrent and metastatic tumors are difficult to treat."

Our news journalists obtained a quote from the research from Leiden University, "We performed a kinase inhibitor screen in two osteosarcoma cell lines, which identified MEK1/2 inhibitors. These inhibitors were further validated in a panel of six osteosarcoma cell lines. Western blot analysis was performed to assess ERK activity and efficacy of MEK inhibition. A 3D culture system was used to validate results from 2D monolayer cultures. Gene expression analysis was performed to identify differentially expressed gene signatures in sensitive and resistant cell lines. Activation of the AKT signaling network was explored using Western blot and pharmacological inhibition. In the screen, Trametinib, AZD8330 and TAK-733 decreased cell viability by more than 50%. Validation in six osteosarcoma cell lines identified three cell lines as resistant and three as sensitive to the inhibitors. Western blot analysis of ERK activity revealed that sensitive lines had high constitutive ERK activity. Treatment with the three MEK inhibitors in a 3D culture system validated efficacy in inhibition of osteosarcoma viability."

According to the news editors, the research concluded: "MEK1/2 inhibition represents a candidate treatment strategy for osteosarcomas displaying high MEK activity as determined by ERK phosphorylation status."

For more information on this research see: MEK inhibition induces apoptosis in osteosarcoma cells with constitutive ERK1/2 phosphorylation. Genes & Cancer, 2015:6(11-12):503-12. (Sage Publications - www.sagepub.com/; Genes & Cancer - gan.sagepub.com)

Liver Diseases and Conditions - Acute Hepatitis

Study Data from M. Dirchwolf et al Provide New Insights into Acute Hepatitis (Clinical epidemiology of acute hepatitis C in South America)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Liver Diseases and Conditions - Acute Hepatitis. According to news reporting originating in Buenos Aires, Argentina, by NewsRx journalists, research stated, "There is scarce data pertaining to acute hepatitis C (aHC) infection in South America. We aimed to describe clinical characteristics and evolution of aHC in a South American cohort."

The news reporters obtained a quote from the research, "A retrospective survey was conducted at 13 hepatology units. All patients 16 years old with aHC diagnosis were included. Demographic, clinical and outcome information were registered in a standardized ad hoc questionnaire. Sixty-four patients were included. The majority were middle-aged (median age: 46 years) and female (65.6%); most of them were symptomatic at diagnosis (79.6%). HCV-1 was the most prevalent genotype (69.2%). Five patients had liver failure: three cases of severe acute hepatitis, one case of fulminant hepatitis and one case of acute-on-chronic liver failure. Nosocomial exposure was the most prevalent risk factor. Evolution was assessed in 46 patients. In the untreated cohort, spontaneous resolution occurred in 45.8% and was associated with higher values of AST/ALT and with the absence of intermittent HCV RNA viremia (P=0.01, 0.05, and 0.01, respectively). In the treated cohort, sustained virological response was associated with nosocomial transmission and early treatment initiation (P=0.04 each)."

According to the news reporters, the research concluded: "The prevalence of nosocomial transmission in this South-American cohort of aHC stresses the importance of following universal precautions to prevent HCV infection. J. Med. Virol. 89:276-283, 2017."

Keywords for this news article include: Buenos Aires, Argentina, South America, Digestive System Diseases and Conditions, Nosocomial Diseases and Conditions, Epidemiology, Risk and Prevention, Infectious Disease and Conditions, Liver Diseases and Conditions, Hepatic Insufficiency, Gastroenterology, Acute Hepatitis, Liver Failure, Hepatology, Genetics.

Bacterial Infections and Mycoses - Aspergillosis

Study Data from M. Shirley et al Provide New Insights into Aspergillosis (Isavuconazole: A Review in Invasive Aspergillosis and Mucormycosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Bacterial Infections and Mycoses - Aspergillosis. According to news reporting originating from Auckland, New Zealand, by NewsRx correspondents, research stated, "Isavuconazole is a second-generation triazole with activity against a broad spectrum of clinically important fungi. Its water-soluble prodrug, isavuconazonium sulfate (Cresemba ®), available in interchangeable intravenous and oral formulations, is approved in the USA and EU for the treatment of adults with invasive aspergillosis and mucormycosis."

Our news editors obtained a quote from the research, "In international phase III clinical trials, isavuconazole was efficacious and generally well tolerated in the treatment of these life-threatening diseases. In the phase III SECURE trial, isavuconazole was non-inferior to voriconazole for the primary treatment of invasive mould disease (primarily aspergillosis) and was associated with fewer drug-related treatment-emergent adverse events (TEAEs) than voriconazole. In addition, the single-arm, phase III VITAL trial and a matched case-control analysis of isavuconazole-versus amphotericin B-treated patients provided evidence of the efficacy of isavuconazole in the treatment of mucormycosis. The most commonly reported TEAEs among isavuconazole recipients were gastrointestinal disorders such as nausea, vomiting and diarrhoea."

According to the news editors, the research concluded: "Isavuconazole has several other attributes that make it a useful new treatment option for these invasive mould diseases, including predictable pharmacokinetics, excellent bioavailability, no food effect with the oral formulation, and its potential utility in renally impaired patients given the absence of cyclodextrin in the intravenous formulation."

The news editors report that additional information may be obtained by contacting M. Shirley, Springer, Auckland 0754, New Zealand.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s40265-016-0652-6. This DOI is a link to an online electronic document that is either free or for purchase.

Membrane Proteins - Immunologic Receptors

Study Data from M.D. Anderson Cancer Center Update Understanding of Immunologic Receptors (The microRNA-200/Zeb1 axis regulates ECM-dependent b1-integrin/FAK signaling, cancer cell invasion and metastasis through CRKL)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Membrane Proteins - Immunologic Receptors have been published. According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "Tumor cell metastasis is a complex process that has been mechanistically linked to the epithelial-mesenchymal transition (EMT). The double-negative feedback loop between the microRNA-200 family and the Zeb1 transcriptional repressor is a master EMT regulator, but there is incomplete understanding of how miR-200 suppresses invasion."

The news correspondents obtained a quote from the research from M.D. Anderson Cancer Center, "Our recent efforts have focused on the tumor cell-matrix interactions essential to tumor cell activation. Herein we utilized both our Kras/p53 mutant mouse model and human lung cancer cell lines to demonstrate that upon miR-200 loss integrin b1-collagen I interactions drive 3D in vitro migration/invasion and in vivo metastases. Zeb1-dependent EMT enhances tumor cell responsiveness to the ECM composition and activates FAK/Src pathway signaling by de-repression of the direct miR-200 target, CRKL. We demonstrate that CRKL serves as an adaptor molecule to facilitate focal adhesion formation, mediates outside-in signaling through Itgb1 to drive cell invasion, and inside-out signaling that maintains tumor cell-matrix contacts required for cell invasion. Importantly, CRKL levels in pan-cancer TCGA analyses were predictive of survival and CRKL knockdown suppressed experimental metastases in vivo without affecting primary tumor growth."

According to the news reporters, the research concluded: "Our findings highlight the critical ECM-tumor cell interactions regulated by miR-200/Zeb1-dependent EMT that activate intracellular signaling pathways responsible for tumor cell invasion and metastasis."

For more information on this research see: The microRNA-200/Zeb1 axis regulates ECM-dependent b1-integrin/FAK signaling, cancer cell invasion and metastasis through CRKL. Scientific Reports, 2016;6():18652. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Oncology - Chronic Myeloid Leukemia

Study Data from M.E. Gaudiano and Co-Authors Update Knowledge of Chronic Myeloid Leukemia (About the discrete-continuous nature of a hematopoiesis model for Chronic Myeloid Leukemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Chronic Myeloid Leukemia have been published. According to news reporting originating from Porto Salvo, Portugal, by NewsRx correspondents, research stated, "Blood of mammals is composed of a variety of cells suspended in a fluid medium known as plasma. Hematopoiesis is the biological process of birth, replication and differentiation of blood cells."

Our news editors obtained a quote from the research, "Despite of being essentially a stochastic phenomenon followed by a huge number of discrete entities, blood formation has naturally an associated continuous dynamics, because the cellular populations can - on average easily be described by (e.g.) differential equations. This deterministic dynamics by no means contemplates some important stochastic aspects related to abnormal hematopoiesis, that are especially significant for studying certain blood cancer deceases. For instance, by mere stochastic competition against the normal cells, leukemic cells sometimes do not reach the population threshold needed to kill the organism. Of course, a pure discrete model able to follow the stochastic paths of billons of cells is computationally impossible. In order to avoid this difficulty, we seek a trade-off between the computationally feasible and the biologically realistic, deriving an equation able to size conveniently both the discrete and continuous parts of a model for hematopoiesis in terrestrial mammals, in the context of Chronic Myeloid Leukemia. Assuming the cancer is originated from a single stem cell inside of the bone marrow, we also deduce a theoretical formula for the probability of non-diagnosis as a function of the mammal average adult mass."

According to the news editors, the research concluded: "In addition, this work cellular dynamics analysis may shed light on understanding Peto's paradox, which is shown here as an emergent property of the discrete-continuous nature of the system."

For more information on this research see: About the discrete-continuous nature of a hematopoiesis model for Chronic Myeloid Leukemia. Mathematical Biosciences, 2016;282 ():174-180. Mathematical Biosciences can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Drugs and Therapies - Heparin Therapy

Study Data from M.H. Ni et al Provide New Insights into Heparin Therapy (Investigating Glycol-Split-Heparin-Derived Inhibitors of Heparanase: A Study of Synthetic Trisaccharides)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Heparin Therapy is the subject of a report. According to news reporting from Milan, Italy, by NewsRx journalists, research stated, "Heparanase is the only known endoglycosidase able to cleave heparan sulfate. Roneparstat and necuparanib, heparanase inhibitors obtained from heparin and currently being tested in man as a potential drugs against cancer, contain in their structure glycol-split uronic acid moieties probably responsible for their strong inhibitory activity."

The news correspondents obtained a quote from the research, "We describe here the total chemical synthesis of the trisaccharide GlcNS6S-GlcA-1,6anGlcNS (1) and its glycol-split (gs) counterpart GlcNS6S-gsGlcA-1,6anGlcNS (2) from glucose. As expected, in a heparanase inhibition assay, compound 2 is one order of magnitude more potent than 1. Using molecular modeling techniques we have created a 3D model of 1 and 2 that has been validated by NOESY NMR experiments. The pure synthetic oligosaccharides have allowed the first in depth study of the conformation of a glycol-split glucuronic acid. Introducing a glycol-split unit in the structure of 1 increases the conformational flexibility and shortens the distance between the two glucosamine motives, thus promoting interaction with heparanase."

According to the news reporters, the research concluded: "However, comparing the relative activities of 2 and roneparstat, we can conclude that the glycol-split motive is not the only determinant of the strong inhibitory effect of roneparstat."

For more information on this research see: Investigating Glycol-Split-Heparin-Derived Inhibitors of Heparanase: A Study of Synthetic Trisaccharides. *Molecules*, 2016;21(11):2709-2722. *Molecules* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. Science

Study Data from Max-Planck-Institute for Molecular Plant Physiology Update Understanding of Science (Gene regulatory network inference using fused LASSO on multiple data sets)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Science have been presented. According to news
originating from Potsdam, Germany, by NewsRx correspondents, research stated, "Devising computational methods to accurately reconstruct gene regulatory networks given gene expression data is key to systems biology applications. Here we propose a method for reconstructing gene regulatory networks by simultaneous consideration of data sets from different perturbation experiments and corresponding controls."

Our news journalists obtained a quote from the research from Max-Planck-Institute for Molecular Plant Physiology, "The method imposes three biologically meaningful constraints: (1) expression levels of each gene should be explained by the expression levels of a small number of transcription factor coding genes, (2) networks inferred from different data sets should be similar with respect to the type and number of regulatory interactions, and (3) relationships between genes which exhibit similar differential behavior over the considered perturbations should be favored. We demonstrate that these constraints can be transformed in a fused LASSO formulation for the proposed method. The comparative analysis on transcriptomics time-series data from prokaryotic species, *Escherichia coli* and *Mycobacterium tuberculosis*, as well as a eukaryotic species, mouse, demonstrated that the proposed method has the advantages of the most recent approaches for regulatory network inference, while obtaining better performance and assigning higher scores to the true regulatory links."

According to the news editors, the research concluded: "The study indicates that the combination of sparse regression techniques with other biologically meaningful constraints is a promising framework for gene regulatory network reconstructions."

For more information on this research see: Gene regulatory network inference using fused LASSO on multiple data sets. *Scientific Reports*, 2016;6():20533. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**Heart Disorders and Diseases - Heart Attack**

**Study Data from Mayo Clinic Update Understanding of Heart Attack (Improving Survival From Cardiac Arrest: A Review of Contemporary Practice and Challenges)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Heart Attack. According to news reporting out of Rochester, Minnesota, by NewsRx editors, research stated, "Cardiac arrest is a common and lethal condition frequently encountered by emergency medicine providers. Resuscitation of persons after cardiac arrest remains challenging, and outcomes remain poor overall."
Our news journalists obtained a quote from the research from Mayo Clinic, "Successful resuscitation hinges on timely, high-quality cardiopulmonary resuscitation. The optimal method of providing chest compressions and ventilator support during cardiac arrest remains uncertain. Prompt and effective defibrillation of ventricular arrhythmias is one of the few effective therapies available for treatment of cardiac arrest. Despite numerous studies during several decades, no specific drug delivered during cardiac arrest has been shown to improve neurologically intact survival after cardiac arrest. Extracorporeal circulation can rescue a minority of highly selected patients with refractory cardiac arrest. Current management of pulseless electrical activity is associated with poor outcomes, but it is hoped that a more targeted diagnostic approach based on electrocardiography and bedside cardiac ultrasonography may improve survival. The evolution of postresuscitation care appears to have improved cardiac arrest outcomes in patients who are successfully resuscitated. The initial approach to early stabilization includes standard measures, such as support of pulmonary function, hemodynamic stabilization, and rapid diagnostic assessment. Coronary angiography is often indicated because of the high frequency of unstable coronary artery disease in comatose survivors of cardiac arrest and should be performed early after resuscitation."

According to the news editors, the research concluded: "Optimizing and standardizing our current approach to cardiac arrest resuscitation and postresuscitation care will be essential for developing strategies for improving survival after cardiac arrest."

Our news journalists report that additional information may be obtained by contacting J.C. Jentzer, Mayo Clinic, Div Cardiovasc Dis, Rochester, MN 55902, United States. Additional authors for this research include C.M. Clements, R.S. Wright, R.D. White and A.S. Jaffe.

**Angiogenesis**

**Study Data from Medical University Update Knowledge of Angiogenesis (Effects of calcitriol on random skin flap survival in rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Angiogenesis is now available. According to news reporting originating from Wenzhou, People's Republic of China, by NewsRx correspondents, research stated, "Calcitriol, a metabolite of vitamin D, is often used in osteoporosis clinics. However, the material has other bioactivities; for example, it accelerates angiogenesis, has anti-inflammatory properties, and inhibits oxidative stress."
Our news editors obtained a quote from the research from Medical University, "We investigated the effects of calcitriol in a random skin flap rat model. 'McFarlane flap' models were established in 84 male Sprague Dawley rats, divided into two groups. One group received intraperitoneal injections of calcitriol (2 mg/kg/day) whereas control rats received intraperitoneal injections of saline. The percentage flap survival area and tissue water content were measured 7 days later, which showed that calcitriol improved flap survival area and reduced tissue edema. It also increased the mean vessel density and upregulated levels of VEGF mRNA/protein, both of which promote flap angiogenesis. Moreover, it decreased leukocyte and macrophage infiltration, reduced the inflammatory proteins IL1b and IL6, increased SOD activity, decreased MDA content, and upregulated the level of autophagy."

According to the news editors, the research concluded: "Overall, our results suggest that calcitriol promotes skin flap survival by accelerating angiogenesis, having anti-inflammatory effects, reducing oxidative stress, and promoting autophagy."

For more information on this research see: Effects of calcitriol on random skin flap survival in rats. Scientific Reports, 2016;6():18945. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting K.L. Granulocytes

Study Data from Medical University Update Understanding of Granulocytes (NETs in cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Granulocytes is now available. According to news reporting originating in Bialystok, Poland, by NewsRx journalists, research stated, "Many aspects of neutrophil hyperactivity and its role in numerous immune responses still remain a mystery. A new neutrophil mechanism was discovered recently, i.e., the formation of neutrophil extracellular traps (NETs)."

The news reporters obtained a quote from the research from Medical University, "These structures, composed of DNA strands and neutrophil granule proteins, are an element of the non-specific immune response and bind pathogens to prevent their spread and ensure increased local concentrations of toxic factors. Research on this phenomenon shows that tumor-associated neutrophils (TANs) also form and release NETs. Reports on the role of NETs in the course of cancer are scarce, and the opinions on the involvement of extracellular traps in the disease are divided, indicating a dual function. There is speculation about the anti-cancer properties of NETs connected with direct killing of cancer cells or stimulation of the immune..."
system. On the other hand, the trap structures might promote migration and immune escape of cancer cells or constitute a physical barrier between cancer cells and immune-competent cells."

According to the news reporters, the research concluded: "This article summarizes our knowledge about the proven roles of NETs in the course of cancer with particular focus on the significance of NETs as prognosis biomarkers in the course of the neoplastic process and their potential use in therapy."

For more information on this research see: NETs in cancer. Tumor Biology, 2016;37(11):14355-14361. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

**Musculoskeletal Diseases and Conditions** -

**Study Data from Medical University Update Understanding of Osteoarthritis (Galectin-3 Induces a Pro-degradative/inflammatory Gene Signature in Human Chondrocytes, Teaming Up with Galectin-1 in Osteoarthritis Pathogenesis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Musculoskeletal Diseases and Conditions - Osteoarthritis. According to news reporting originating in Vienna, Austria, by NewsRx journalists, research stated, "Inflammatory chemo-and cytokines and matrix-degrading proteases underlie the progression of osteoarthritis (OA). Aiming to define upstream regulators for these disease markers, we pursued initial evidence for an upregulation of members of the adhesion/growth-regulatory galectin family."

The news reporters obtained a quote from the research from Medical University, "Immunohistochemical localization of galectin-3 (Gal-3) in sections of human cartilage with increasing levels of degeneration revealed a linear correlation reaching a chondrocyte positivity of 60%. Presence in situ was cytoplasmic, the lectin was secreted from OA chondrocytes in culture and binding of Gal-3 yielded lactose-inhibitable surface staining. Exposure of cells to the lectin led to enhanced gene expression and secretion of functional disease markers. Genome-wide transcriptomic analysis broadened this result to reveal a pro-degradative/inflammatory gene signature under the control of NF-kappa B. Fittingly, targeting this route of activation by inhibitors impaired the unfavourable response to Gal-3 binding, as also seen by shortening the lectin's collagen-like repeat region. Gal-3's activation profile overlaps with that of homodimeric galectin-1 (Gal-1) and also has distinctive (supplementing) features. Tested at subsaturating
concentrations in a mixture, we found cooperation between the two galectins, apparently able to team up to promote OA pathogenesis."

According to the news reporters, the research concluded: "In summary, our results suggest that a network of endogenous lectins is relevant for initiating this process cascade."

For more information on this research see: Galectin-3 Induces a Pro-degradative/inflammatory Gene Signature in Human Chondrocytes, Teaming Up with Galectin-1 in Osteoarthritis Pathogenesis. Scientific Reports, 2016;6():1-15. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/srep/)

**Genetics - Genetics and Cancer**

**Study Data from Molecular Genetics Laboratory Update Knowledge of Genetics and Cancer (BRCA1-2 Diagnostic Workflow from Next-Generation Sequencing Technologies to Variant Identification and Final Report)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Genetics - Genetics and Cancer is the subject of a report. According to news reporting originating in Bari, Italy, by NewsRx journalists, research stated, "The BRCA1-BRCA2 genes predispose to hereditary breast and ovarian cancer, and the germline and mutational status of these genes defines a target population that can benefit from PARP inhibitor treatments. To respond to the increasing number of BRCA1-BRCA2 tests, it is necessary to shift to high-throughput technologies that are reliable and less time consuming."

The news reporters obtained a quote from the research from Molecular Genetics Laboratory, "Different methodological platforms are dedicated to this purpose with different approaches and algorithms for analysis. Our aim was to set up a cost-effective and low time-consuming BRCA1-BRCA2 mutation detection workflow using the Ion Torrent PGM technology. A retrospective cohort of 40 patients with familial breast/ovarian cancer previously tested by Sanger sequencing and a prospective cohort of 72 patients (validation set) were analyzed. The validation set included 64 patients affected by familial breast/ovarian cancer and eight sporadic ovarian cancer cases, who are potential candidates for PARPi treatments. A complete and standardized workflow easily usable and suitable in a certified laboratory has been proved and validated. This includes all steps from library preparation to the final report."

According to the news reporters, the research concluded: "The use of next-generation sequencing will be of benefit for patients enrolled in the genetic counseling process and,
moreover, will enhance the process of selecting patients eligible for personalized treatments."

Our news correspondents report that additional information may be obtained by contacting S. Tommasi, IRCCS Ist Tumori Giovanni Paolo II, Mol Genet Lab, I-70124 Bari, Italy. *Study Data from Monash University Update Understanding of Obesity (Disrupted functional connectivity in adolescent obesity)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news originating from Melbourne, Australia, by NewsRx correspondents, research stated, "Obesity has been associated with brain alterations characterised by poorer interaction between a hypersensitive reward system and a comparatively weaker prefrontal-cognitive control system. These alterations may occur as early as in adolescence, but this notion remains unclear, as no studies so far have examined global functional connectivity in adolescents with excess weight."

Financial supporters for this research include Andalusian Health Service, MICINN, NEUROECOBE, Carlos III Health Institute.

Our news journalists obtained a quote from the research from Monash University, "We investigated functional connectivity in a sample of 60 adolescents with excess weight and 55 normal weight controls. We first identified parts of the brain displaying between-group global connectivity differences and then characterised the extent of the differences in functional network integrity and their association with reward sensitivity. Adolescent obesity was linked to neuroadaptations in functional connectivity within brain hubs linked to interoception (insula), emotional memory (middle temporal gyrus) and cognitive control (dorsolateral prefrontal cortex) (pFWE < 0.05). The connectivity between the insula and the anterior cingulate cortex was reduced in comparison to controls, as was the connectivity between the middle temporal gyrus and the posterior cingulate cortex and cuneus/precuneus (pFWE < 0.05). Conversely, the middle temporal gyrus displayed increased connectivity with the orbitofrontal cortex (pFWE < 0.05). Critically, these networks were correlated with sensitivity to reward (p < 0.05). These findings suggest that adolescent obesity is linked to disrupted functional connectivity in brain networks relevant to maintaining balance between reward, emotional memories and cognitive control."

According to the news editors, the research concluded: "Our findings may contribute to reconceptualization of obesity as a multi-layered brain disorder leading to compromised motivation and control, and provide a biological account to target prevention strategies for adolescent obesity."

The news correspondents report that additional information may be obtained from A. Verdejo-Garcia, Monash University, Monash Inst Cognit & Clin, Neurosci, Melbourne, Vic, Australia. Additional authors for this research include O. Contreras-Rodriguez, C. Soriano-Mas, E.A. Stamatakis and A. Verdejo-Garcia.

Heart Disorders and Diseases - Tachycardia

**Study Data from Murdoch Children's Research Institute Update Understanding of Tachycardia (Long-term outcomes after first-onset arrhythmia in Fontan physiology)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Tachycardia are discussed in a new report. According to news reporting originating from Parkville, Australia, by NewsRx correspondents, research stated, "Patients living with a Fontan circulation are prone to develop arrhythmias. However, their prognostic impact has been seldom studied."

Our news editors obtained a quote from the research from Murdoch Children's Research Institute, "As such, we aimed to determine the incidence and predictors of arrhythmias after the Fontan procedure and the long-term outcomes after the first onset of arrhythmias. Of the 1034 patients who have undergone a Fontan procedure as recorded in the Australian and New Zealand Fontan Registry, we identified those in whom a tachyarrhythmia or bradyarrhythmia developed. We evaluated the incidence and predictors of developing arrhythmias and their prognostic impact on late outcomes. Arrhythmia developed in 195 patients. Tachyarrhythmia was present in 162 patients, bradyarrhythmia was present in 74 patients, and both forms were present in 41 patients. At 20 years, freedom from any arrhythmia, tachyarrhythmia, and bradyarrhythmia was 66% (95% confidence interval [CI], 59-72), 69% (95% CI, 62-75), and 85% (95% CI, 80-90), respectively. On multivariable analyses, patients with an extracardiac Fontan (hazard ratio [HR], 0.23; 95% CI, 0.10-0.51; P<.001) were less likely to develop an arrhythmia, whereas those with left atrial (HR, 3.18; 95% CI, 1.45-6.95; P = .004) and right atrial (HR, 4.00; 95% CI, 2.41-6.61; P < .001) isomerism were more likely to have an arrhythmia. After onset of any arrhythmia (tachyarrhythmia or bradyarrhythmia), 10- and 15-year survivals were 74% (65%-83%) and 70% (60%-80%), respectively, and freedom from Fontan failure was 55% (44%-64%) and 44% (32%-56%), respectively. The development of any arrhythmia (HR, 2.20; 95% CI, 1.44-3.34; P < .001), tachyarrhythmia (HR, 2.56; 95% CI, 1.60-4.11; P < .001), and bradyarrhythmia (HR, 1.85; 95% CI, 1.16-2.95; P = .01) were all
independent predictors of late Fontan failure on multivariable analyses."

According to the news editors, the research concluded: "The development of an arrhythmia is associated with a heightened risk of subsequent failure of the Fontan circulation."

The news editors report that additional information may be obtained by contacting Y. d'Udekem, Murdoch Childrens Res Inst, Parkville, Vic, Australia. Additional authors for this research include W.Y. Shi, A.J. Iyengar, A. Nisbet, V. Forsdick, D. Zannino, T. Gentles, D.J. Radford, R. Justo, D.S. Celermajer, A. Bullock, D. Winlaw, G. Wheaton, L. Grigg and Y. d'Udekem.

**Mental Health Diseases and Conditions - Depression**

**Study Data from N. Aarts and Co-Authors Update Knowledge of Depression (Use of Selective Serotonin Reuptake Inhibitors and Sleep Quality: A Population-Based Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mental Health Diseases and Conditions - Depression. According to news originating from Utrecht, Netherlands, by NewsRx correspondents, research stated, "Poor sleep is a risk factor for the development and recurrence of depression. Selective serotonin reuptake inhibitor (SSRI) use is consistently associated with good subjective sleep in clinically depressed patient populations."

Our news journalists obtained a quote from the research, "However, studies in the general population are lacking. Our objective was to investigate the association between SSRIs and subjective sleep in a middle-aged and elderly population in a daily practice setting. We included participants from the prospective Rotterdam Study cohort. Participants had up to two subjective sleep measurements assessed with Pittsburgh Sleep Quality Index ([PSQI], number of measurements = 14,770). SSRI use was based on pharmacy records. We assessed the association between SSRIs and PSQI score and its sub-components, with nonusers of any antidepressant as reference. Analyses were, among others, adjusted for presence of depressive symptoms and concurrent psycholeptic drug use. We included 9,267 participants, average baseline age 66.3 y (standard deviation 10.6), and 57.6% women. SSRI use was significantly associated with a 0.78-point lower PSQI score (95% confidence interval [CI] -1.11; -0.44) which reflects better sleep, compared with non-use. The association was more prominent in continuous SSRI users (-0.71
points, 95% CI -1.18; -0.24). Of the sub-components, SSRIs were associated with 0.70-h longer sleep duration (95% CI 0.56; 0.85), higher sleep quality, higher sleep efficiency, and in contrast more daytime dysfunction. SSRI use was associated with better subjective sleep, after adjustment for depressive symptoms and concurrent psycholeptic drug use."

According to the news editors, the research concluded: "This suggests that, in clinical practice in the middle-aged and elderly population, the sleep quality of some persons may benefit from, continued, SSRI use."

For more information on this research see: Use of Selective Serotonin Reuptake Inhibitors and Sleep Quality: A Population-Based Study. Journal of Clinical Sleep Medicine, 2016;12(7):989-995. Liver Diseases and Conditions - Hepatitis C Virus

Study Data from NUST Update Knowledge of Hepatitis C Virus (Ionotropic Purinergic Receptors P2X4 and P2X7: Proviral or Antiviral? An Insight into P2X Receptor Signaling and Hepatitis C Virus Infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Hepatitis C Virus have been published. According to news reporting originating from Islamabad, Pakistan, by NewsRx correspondents, research stated, "Purinergic P2X receptors are plasma membrane bound, ATP-gated ion channels that are expressed on wide range of cells and respond to varying ATP concentrations in extracellular environment. Upon activation they increase membrane permeability for Ca2+ ions and trigger a cascade of signaling complexes."

Our news editors obtained a quote from the research from NUST, "During the course of hepatitis C virus (HCV) infection, ATP is released from the infected hepatocyte, which binds with Purinergic receptors (P2X) on peripheral blood mononuclear cells (PBMCs) and initiate downstream signaling pathways by disturbing the ionic balance of the cell. The present study investigates quantitative expression of P2X7 and P2X4 along with selected host genes PEPCK, transforming growth factor beta (TGF-beta), MAPK, Rho, and Akt in PBMCs of chronic HCV infection patients. PBMCs were isolated from collected blood samples of study subjects. Transcript analysis of P2X7, P2X4, and targeted downstream genes was done using quantitative real-time polymerase chain reaction. Relative expression analysis was performed by unpaired Student's t test on GraphPad Prism version 5. We found a notable increase of threefolds and 1.8-
folds in the expression of P2X7 and P2X4 receptors in treatment naive category while the expression of PEPCK, TGF-beta, MAPK, AKT, and Rho A increased by 2.8, 1.9, 2.2, 2.2, and 1.8-folds, respectively. In sustained virological response patients, P2X7 significantly increased up to 3.5-folds while the expression of P2X4 receptor was increased up to twofold. In third category, treatment nonresponder, the expression of P2X7, P2X4 receptors, and targeted markers remained un-altered. This study deals with two major aspects of P2X4 and P2X7 receptors in PBMCs of chronic HCV individuals."

According to the news editors, the research concluded: "One is their role in providing antiviral immunity to host against HCV; second aspect is the role of P2X receptors in inducing HCV pathogenesis via AKT, TGF-beta, Rho A, PEPCK, and MAPK expression."

For more information on this research see: Ionotropic Purinergic Receptors P2X4 and P2X7: Proviral or Antiviral? An Insight into P2X Receptor Signaling and Hepatitis C Virus Infection. *Viral Immunology*, 2016;29(7):401-408. *Viral Immunology* can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. the study period, a total of 2863 TAE/TACE procedures were performed among 1120 patients, and a total of 24 patients (21 male and 3 female) developed major complication with the incidence of 2.1% (24/1120) per patient and 0.84% (24/2863) per TAE/TACE procedure. The major complications were liver rupture (n=6), liver abscess (n=5), femoral artery pseudoaneurysm (n=3), cholecystitis (n=2), biloma (n=2), pulmonary embolism (n=2), and 1 each of the following: cerebral lipiodol embolism, tumor lysis syndrome, partial intestinal obstruction, gallbladder perforation. The mean interval from last TAE/TACE procedure to the diagnosis of major complication was 11.1 +/- 7.7 days. The treatments of the complications were conservative treatment (n=12), conservative treatment plus percutaneous drainage (n=3), ultrasound-guided thrombin injection (n=3), conservative treatment plus TAE (n=2), and conservative treatment plus surgery (n=2). Of the 24 patients, 20 patients were recovered, and remaining 4 patients were died of major complications; therefore, the mortality rate of major complication was 16.7% (4/24).

According to the news reporters, the research concluded: "Major complication following conventional TAE/TACE therapy is uncommon; the outcomes are benign of most major complications, but some are mortality."

For more information on this research see: The incidence and outcome of major complication following conventional TAE/TACE for hepatocellular carcinoma. Medicine, 2016;95(49):562-567. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Inter cellular Signaling Peptides and Proteins -...**

**Study Data from National Center for Scientific Research (CNRS) Provide New Insights into Cytokines (Spatiotemporal control of interferon-induced JAK/STAT signalling and gene transcription by the retromer complex)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Intercellular Signaling Peptides and Proteins - Cytokines have been published. According to news reporting out of Paris, France, by NewsRx editors, research stated, "Type-I interferons (IFNs) play a key role in the immune defences against viral and bacterial infections, and in cancer immunosurveillance. We have established that clathrin-dependent endocytosis of the type-I interferon (IFN-alpha/beta) receptor (IFNAR) is required for JAK/STAT signalling."

Our news journalists obtained a quote from the research from National Center for Scientific Research (CNRS), "Here we show that the internalized IFNAR1 and IFNAR2..."
subunits of the IFNAR complex are differentially sorted by the retromer at the early endosome. Binding of the retromer VPS35 subunit to IFNAR2 results in IFNAR2 recycling to the plasma membrane, whereas IFNAR1 is sorted to the lysosome for degradation. Depletion of VPS35 leads to abnormally prolonged residency and association of the IFNAR subunits at the early endosome, resulting in increased activation of STAT1 and IFN-dependent gene transcription.

According to the news editors, the research concluded: "These experimental data establish the retromer complex as a key spatiotemporal regulator of IFNAR endosomal sorting and a new factor in type-I IFN-induced JAK/STAT signalling and gene transcription."

Our news journalists report that additional information may be obtained by contacting C. Lamaze, CNRS, UMR 3666, F-75005 Paris, France. Additional authors for this research include N. Sharma, N. Zanin, C.V. de Lesegno, M. Shafaq-Zadah, V. Sibut, F. Dingli, P. Hupe, S. Wilmes, J. Pehler, D. Loew, L. Johannes, G. Schreiber and C. Lamaze.

Study Data from National Institute of Diabetes and Digestive and Kidney Diseases Update Understanding of Obesity (How Strongly Does Appetite Counter Weight Loss? Quantification of the Feedback Control of Human Energy Intake)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Obesity is the subject of a report. According to news originating from Bethesda, Maryland, by NewsRx correspondents, research stated, "To quantify the feedback control of energy intake in response to long-term covert manipulation of energy balance in free-living humans. A validated mathematical method was used to calculate energy intake changes during a 52-week placebo-controlled trial in 153 patients treated with canagliflozin, a sodium glucose co-transporter inhibitor that increases urinary glucose excretion, thereby resulting in weight loss without patients being directly aware of the energy deficit."

Our news journalists obtained a quote from the research from the National Institute of Diabetes and Digestive and Kidney Diseases, "The relationship between the body weight time course and the calculated energy intake changes was analyzed using principles from engineering control theory. It was discovered that weight loss leads to a proportional increase in appetite resulting in eating above baseline by similar to 100 kcal/day per kilogram of lost weight-an amount more than threefold larger than the corresponding energy expenditure adaptations."

According to the news editors, the research concluded: "While energy expenditure adaptations have often been considered the main reason for slowing of weight loss and
subsequent regain, feedback control of energy intake plays an even larger role and helps explain why long-term maintenance of a reduced body weight is so difficult."

The news correspondents report that additional information may be obtained from K.D. Hall, National Institute of Diabetes & Digestive & Kidney Diseases, National Institutes of Health, Bethesda, MD 20892, United States. Additional authors for this research include A. Sanghvi, R.J. Seeley and K.D. Hall.

Keywords for this news article include: Bethesda, Maryland, United States, North and Central America, Obesity, Nutritional and Metabolic Diseases and Conditions, National Institute of Diabetes and Digestive and Kidney Diseases.

### Mental Health Diseases and Conditions - Depression

**Study Data from National Institute of Neuroscience Update Knowledge of Depression (Blood-based gene expression signatures of medication-free outpatients with major depressive disorder: integrative genome-wide and candidate gene analyses)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mental Health Diseases and Conditions - Depression. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Several microarray-based studies have investigated gene expression profiles in major depressive disorder (MDD), yet with highly variable findings. We examined blood-based genome-wide expression signatures of MDD, focusing on molecular pathways and networks underlying differentially expressed genes (DEGs) and behaviours of hypothesis-driven, evidence-based candidate genes for depression."

Our news journalists obtained a quote from the research from the National Institute of Neuroscience, "Agilent human whole-genome arrays were used to measure gene expression in 14 medication-free outpatients with MDD who were at least moderately ill and 14 healthy controls matched pairwise for age and sex. After filtering, we compared expression of entire probes between patients and controls and identified DEGs. The DEGs were evaluated by pathway and network analyses. For the candidate gene analysis, we utilized 169 previously prioritized genes and examined their case-control separation efficiency and correlational co-expression network in patients relative to controls. The 317 screened DEGs mapped to a significantly over-represented pathway, the 'synaptic transmission' pathway. The protein-protein interaction network was also significantly enriched, in which a number of key molecules for depression were included. The co-expression network of candidate genes was markedly disrupted in patients."

According to the news editors, the research concluded: "This study provided evidence for an altered molecular network along with several key molecules in MDD and confirmed that the candidate genes are worthwhile targets for depression research."
For more information on this research see: Blood-based gene expression signatures of medication-free outpatients with major depressive disorder: integrative genome-wide and candidate gene analyses. *Scientific Reports*, 2016;6():18776. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

*Drugs and Therapies - Central Nervous System Agents*

**Study Data from National Institutes of Health Update Understanding of Central Nervous System Agents [Novel and High Affinity 2-[(Diphenylmethyl)sulfinyl]acetamide (Modafinil) Analogues as Atypical Dopamine Transporter Inhibitors]***

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Central Nervous System Agents is now available. According to news originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "The development of pharmacotherapeutic treatments of psychostimulant abuse has remained a challenge, despite significant efforts made toward relevant mechanistic targets, such as the dopamine transporter (DAT). The atypical DAT inhibitors have received attention due to their promising pharmacological profiles in animal models of cocaine and methamphetamine abuse."

Funders for this research include Det Frie Forskningsrad, National Institute on Drug Abuse, Lundbeckfonden.

Our news journalists obtained a quote from the research from the National Institutes of Health, "Herein, we report a series of modafinil analogues that have an atypical DAT inhibitor profile. We extended SAR by chemically manipulating the oxidation states of the sulfoxide and the amide functional groups, halogenating the phenyl rings, and/or functionalizing the terminal nitrogen with substituted piperazines, resulting in several novel leads such as 11b, which demonstrated high DAT affinity (K-i = 2.5 nM) and selectivity without producing concomitant locomotor stimulation in mice, as compared to cocaine."

According to the news editors, the research concluded: "These results are consistent with an atypical DAT inhibitor profile and suggest that 11b may be a potential lead for development as a psychostimulant abuse medication."

For more information on this research see: Novel and High Affinity 2-[(Diphenylmethyl)sulfinyl]acetamide (Modafinil) Analogues as Atypical Dopamine Transporter Inhibitors. *Journal of Medicinal Chemistry*, 2016;59(23):10676-10691. *Journal of Medicinal*
Ebola Virus

Study Data from National Institutes of Health Update Understanding of Ebola Virus (Ebola Virus Replication and Disease Without Immunopathology in Mice Expressing Transgenes to Support Human Myeloid and Lymphoid Cell Engraftment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Ebola Virus. According to news originating from Hamilton, Montana, by NewsRx correspondents, research stated, "The study of Ebola virus (EBOV) pathogenesis in vivo has been limited to nonhuman primate models or use of an adapted virus to cause disease in rodent models. Herein we describe wild-type EBOV (Makona variant) infection of mice engrafted with human hematopoietic CD34(+) stem cells (Hu-NSG™-SGM3 mice; hereafter referred to as SGM3 HuMice)."

Financial supporters for this research include National Institutes of Health, NIH, Intramural Research Program of the National Institute of Allergy and Infectious Diseases.

Our news journalists obtained a quote from the research from the National Institutes of Health, "SGM3 HuMice support increased development of myeloid immune cells, which are primary EBOV targets. In SGM3 HuMice, EBOV replicated to high levels, and disease was observed following either intraperitoneal or intramuscular inoculation. Despite the high levels of viral antigen and inflammatory cell infiltration in the liver, the characteristic histopathology of Ebola virus disease was not observed, and this absence of severe immunopathology may have contributed to the recovery and survival of some of the animals."

According to the news editors, the research concluded: "Future investigations into the underlying mechanisms of the atypical disease presentation in SGM3 HuMice will provide additional insights into the immunopathogenesis of severe EBOV disease."

For more information on this research see: Ebola Virus Replication and Disease Without Immunopathology in Mice Expressing Transgenes to Support Human Myeloid and Lymphoid Cell Engraftment. *Journal of Infectious Diseases*, 2016;214():S308-S318. *Journal

Oncology - Cancer Epidemiology

Study Data from New York State Department of Health Update Knowledge of Cancer Epidemiology (Effects of the length of central cancer registry operations on identification of subsequent cancers and on survival estimates)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Cancer Epidemiology are presented in a new report. According to news reporting out of Albany, New York, by NewsRx editors, research stated, "Population-based cancer survival analyses have traditionally been based on the first primary cancer. Recent studies have brought this practice into question, arguing that varying registry reference dates affect the ability to identify earlier cancers, resulting in selection bias."

Our news journalists obtained a quote from the research from the New York State Department of Health, "We used a theoretical approach to evaluate the extent to which the length of registry operations affects the classification of first versus subsequent cancers and consequently survival estimates. Sequence number central was used to classify tumors from the New York State Cancer Registry, diagnosed 2001-2010, as either first primaries (value = 0 or 1) or subsequent primaries (> 2). A set of three sequence numbers, each based on an assumed reference year (1976, 1986 or 1996), was assigned to each tumor. Percent of subsequent cancers was evaluated by reference year, cancer site and age. 5-year relative survival estimates were compared under four different selection scenarios. The percent of cancer cases classified as subsequent primaries was 15.3%, 14.3% and 11.2% for reference years 1976, 1986 and 1996, respectively; and varied by cancer site and age. When only the first primary was included, shorter registry operation time was associated with slightly lower 5-year survival estimates. When all primary cancers were included, survival estimates decreased, with the largest decreases seen for the earliest reference year. Registry operation length affected the identification of subsequent cancers, but the overall effect of this misclassification on survival
estimates was small."

According to the news editors, the research concluded: "Survival estimates based on all primary cancers were slightly lower, but might be more comparable across registries."

For more information on this research see: Effects of the length of central cancer registry operations on identification of subsequent cancers and on survival estimates. Cancer Epidemiology, 2016;44():52-58. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. (Elsevier - www.elsevier.com; Cancer Epidemiology - www.journals.elsevier.com/cancer-epidemiology/)

**Transplant Medicine - Heart Transplants**

**Study Data from Ohio State University Provide New Insights into Heart Transplants (The impact of length and weight on survival after heart transplantation in children less than 24 months of age)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transplant Medicine - Heart Transplants have been published. According to news reporting originating in Columbus, Ohio, by NewsRx journalists, research stated, "Adults, older children, and adolescent patients with a BMI categorized as overweight or obese have decreased survival after HTx. Anthropometric correlates of survival after HTx in infants have not been well defined."

The news reporters obtained a quote from the research from Ohio State University, "In a retrospective analysis of the UNOS registry, patients age 0-24 months were classified according to the WHO height-for-age and weight-for-age norms, as well as arbitrary BMI-for-age percentiles. Outcomes of 1-year survival, conditional long-term survival, and cause-specific mortality were examined. Infants with stunted growth according to the WHO definition had increased risks of early mortality, late mortality, and death due to graft failure after HTx. Secondary analysis of first-year survival demonstrated increased mortality in children who were underweight according to weight-for-age, but a survival disadvantage in the highest BMI-for-age category, likely due to short recumbent length leading to relatively high BMI values. Stunted growth relative to WHO standards predicts mortality following heart transplant in children less than 2 years of age."

According to the news reporters, the research concluded: "The association between post-transplant mortality and high BMI-for-age, as demonstrated in older cohorts, was observed in the infant cohort only due to stunting, and not due to overweight classification."

For more information on this research see: The impact of length and weight on

Our news correspondents report that additional information may be obtained by contacting C. Mckee, Ohio State University, Coll Med, Dept. of Pediat, Columbus, OH 43210, United States. Additional authors for this research include D. Tumin, D. Hayes and J.D. Tobias.

**Vaccination**

**Study Data from Oregon State University Update Understanding of Vaccination (Preventive Services Use Among African American and Latino Adult Caregivers in South Los Angeles)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Vaccination. According to news reporting out of Corvallis, Oregon, by NewsRx editors, research stated, "The burden of informal caregiving is significant and well-documented, yet the evidence is mixed as to whether being a caregiver presents an additional barrier to receiving recommended preventive care. To determine whether (1) caregivers compared with noncaregivers were less likely to receive preventive health services; and (2) higher intensity caregivers were less likely to receive preventive health services than lower intensity caregivers."

Our news journalists obtained a quote from the research from Oregon State University, "Subjects, and Measures: Data were from a telephone survey of Latino and African American adults 50 years or older in South Los Angeles (n=702). Outcomes were flu vaccination, pneumococcal vaccination, and colorectal cancer screening. Logistic regression models adjusted for predisposing, enabling, and need factors according to the Andersen Model of Access to Health Care for Low-income Populations. Caregiver type (eg, adult child, nonrelated) was associated with varying odds of receiving a preventive service. Caregivers had lower odds than noncaregivers of receiving preventive services although odds of receiving a flu vaccination improved slightly for caregivers of persons with memory loss compared with other caregivers. More weekly caregiving hours was associated with higher odds of receiving flu vaccination (adjusted odds ratios, 1.1; 95% confidence interval=1.0, 1.1) or colorectal cancer screening (adjusted odds ratios, 1.1; 95% confidence interval=1.0, 1.1). Caregivers and noncaregivers age 65 and older or with chronic conditions were more likely to receive vaccinations. Preventive service use was influenced by characteristics of the caregiving situation."

According to the news editors, the research concluded: "An opportunity may exist to leverage care recipients' ongoing contact with health care providers to increase caregivers' own access to preventive services."

For more information on this research see: Preventive Services Use Among African
American and Latino Adult Caregivers in South Los Angeles. *Medical Care*, 2016;55(12):1098-1104. *Medical Care* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Oncology - Lymphoma**

**Study Data from Osaka University School of Medicine Update Knowledge of Lymphoma (Optical coherence tomography manifestations of primary vitreoretinal lymphoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lymphoma. According to news reporting originating from Osaka, Japan, by NewsRx correspondents, research stated, "Primary vitreoretinal lymphoma (PVRL), a subset of primary central nervous system lymphoma (PCNSL), is a high-grade malignant tumor that shows various chorioretinal findings. Optical coherence tomography (OCT) is useful for detecting these lesions, and various abnormalities on OCT images have been reported."

Our news editors obtained a quote from the research from the Osaka University School of Medicine, "The purpose of this report was to investigate retrospectively the OCT manifestations of various disease stages and compare the manifestations of pretreatment, recurrent, and chronic cases. We reviewed the medical charts and OCT images of 38 consecutive cases with PVRL. When abnormalities were detected on OCT images, the patients were classified based on the treatment of the primary disease: pretreatment if not treated, recurrent if treated previously, and chronic when chronic changes. Twenty-six eyes (20 cases) had abnormalities in the post-pole OCT images, i.e., 16 eyes (12 cases) were in the pretreatment group, seven eyes (five cases) were in the recurrent group, and five eyes (five cases) were in the chronic group. Two eyes (two cases) had abnormalities on OCT in the pretreatment and recurrent or chronic stages. The pretreatment and recurrent groups had subretinal or retinal pigment epithelium (RPE) level abnormalities more often than intraretinal changes. Twelve of 16 pretreated eyes and all seven eyes with recurrent disease had subretinal or RPE level abnormalities. One pretreatment case and three recurrent cases had atypical OCT manifestations of intraretinal (round lesions) or epiretinal changes (villous-shaped lesions)."

According to the news editors, the research concluded: "Although pretreatment cases and recurrent cases showed similar OCT abnormalities and the specific changes in the various disease stages were unclarified, collecting OCT data from various disease stages will facilitate detection of typical OCT changes of PVRL and lead to early diagnosis and treatment."

The news editors report that additional information may be obtained by contacting N. Ohguro, Osaka Univ Med Sch, Dept. of Ophthalmol, Suita, Osaka 5650871, Japan. Additional authors for this research include N. Ohguro, C. Iwashashi and N. Hashida.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s00417-016-3395-x. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Colon Cancer**

**Study Data from Pasteur Institute Update Understanding of Colon Cancer (A Comprehensive Review of Clinical Trials on EGFR Inhibitors Such as Cetuximab and Panitumumab as Monotherapy and in Combination for Treatment of Metastatic Colorectal ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Colon Cancer have been presented. According to news reporting from Karaj, Iran, by NewsRx journalists, research stated, "Metastatic colorectal cancer is the fourth most common cause of death due to cancer after those of lung, stomach, and liver. Anti epidermal growth factor receptor drugs as a targeting therapy seem to be good candidates for curing metastatic colorectal cancer."

The news correspondents obtained a quote from the research from Pasteur Institute, "Two available anti epidermal growth factor receptor monoclonal antibodies are cetuximab and panitumumab which have been approved for metastatic colorectal cancer treatment. Through the available literature on NCBI and clinical trials, 31 clinical trials in which cetuximab or panitumumab as monotherapy or in combination with chemotherapy were used for the treatment of metastatic colorectal cancer patients in different line settings and 12 clinical trials in which bevacizumab was used for being compared with anti epidermal growth factor receptor monoclonal antibodies or chemotherapy were chosen for reviewing and comparing the results of overall survival, progression free survival and adverse effects. Cetuximab and panitumumab are well accepted for the treatment of mCRC patients at all stages in different line settings. Although cetuximab administration in metastatic colorectal cancer patients is mostly associated with better overall survival and panitumumab results in better progression free survival, to confirm the superiority of each of them in the treatment protocol of epidermal growth factor receptor monoclonal antibodies, more clinical trials with larger sample size are needed."

According to the news reporters, the research concluded: "Through current available data from clinical studies, it can be concluded that the best treatment outcome is achieved by a
combination of anti epidermal growth factor receptor monoclonal antibodies with conventional chemotherapy."

For more information on this research see: A Comprehensive Review of Clinical Trials on EGFR Inhibitors Such as Cetuximab and Panitumumab as Monotherapy and in Combination for Treatment of Metastatic Colorectal Cancer. Avicenna Journal of Medical Biotechnology, 2015;7(4):134-44.

Our news journalists report that additional information may be obtained by contacting M.H. Yazdi, Dept. of Research and Development, Pasteur Institute of Iran, Karaj, Iran. Additional authors for this research include M.A. Faramarzi, S. Nikfar and M. Abdollahi.

Disease Attributes - Disease Progression

Study Data from Pennsylvania State University Update Knowledge of Disease Progression (Changes in Bone Turnover Marker Levels and Clinical Outcomes in Patients with Advanced Cancer and Bone Metastases Treated with Bone Anti-resorptive Agents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Disease Attributes - Disease Progression have been published. According to news reporting originating from Hershey, Pennsylvania, by NewsRx correspondents, research stated, "Bone anti-resorptive agents can significantly reduce bone turnover markers (BTM) in patients with advanced cancer. We evaluated association of changes in BTMs with overall survival (OS), disease progression (DP), and disease progression in bone (DPB) in patients with advanced cancer and bone metastases following denosumab or zoledronic acid treatment."

Our news editors obtained a quote from the research from Pennsylvania State University. "This is an integrated analysis of patient-level data from three identically designed, blinded, phase III trials with patients randomized to subcutaneous denosumab or intravenous zoledronic acid. Levels of the BTMs urinary N-telopeptide (uNTx) and serum bone-specific alkaline phosphatase (sBSAP) measured at study entry and month 3 were analyzed. OS, DP, and DPB were compared in patients with BTMs >= median versus < median based on month 3 assessments. uNTx levels >= the median of 10.0 nmol/mmol at month 3 were associated with significantly reduced OS compared with levels < median (HR for death, 1.85; P< 0.0001). sBSAP levels >= median of 12.6 ng/mL were associated with significantly reduced OS compared with levels < median (HR for death, 2.44; P< 0.0001). uNTx and sBSAP levels >= median at month 3 were associated with significantly greater risk of DP (HR, 1.31; P< 0.0001 and HR, 1.71; P< 0.0001, respectively) and DPB (HR, 1.11; P = 0.0407 and HR, 1.27; P< 0.0001, respectively). BTM levels >= median after 3 months of bone anti-resorptive treatment were associated with reduced OS and increased risk of DP and DPB."

According to the news editors, the research concluded: "Assessment of uNTx and
sBSAP levels after bone antiresorptive therapy may add to identification of patients at risk for worse clinical outcomes."

For more information on this research see: Changes in Bone Turnover Marker Levels and Clinical Outcomes in Patients with Advanced Cancer and Bone Metastases Treated with Bone Antiresorptive Agents. *Clinical Cancer Research*, 2016;22(23):5713-5721. *Clinical Cancer Research* can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Oncology - Squamous Cell Carcinoma

**Study Data from R. Bueno and Co-Authors Update Knowledge of Squamous Cell Carcinoma (HOX genes: potential candidates for the progression of laryngeal squamous cell carcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Squamous Cell Carcinoma have been published. According to news reporting originating in Ribeirao Preto, Brazil, by NewsRx journalists, research stated, "Laryngeal squamous cell carcinoma (LSCC) is a very aggressive cancer, considered to be a subtype of the head and neck squamous cell carcinoma (HNSCC). Despite significant advances in the understanding and treatment of cancer, prognosis of patients with LSCC has not improved recently."

Financial supporters for this research include Fundacao de Amparo a Pesquisa do Estado de Sao Paulo, Conselho Nacional de Desenvolvimento Cientifico e Tecnologico.

The news reporters obtained a quote from the research, "In the present study, we sought to understand better the genetic mechanisms underlying LSCC development. Thirty-two tumor samples were collected from patients undergoing surgical resection of LSCC. The samples were submitted to whole-genome cDNA microarray analysis aiming to identify genetic targets in LSCC. We also employed bioinformatic approaches to expand our findings using the TCGA database and further performed functional assays, using human HNSCC cell lines, to evaluate viability, cell proliferation, and cell migration after silencing of selected genes. Eight members of the homeobox gene family (HOX) were identified to be overexpressed in LSCC samples when compared to normal larynx tissue. Quantitative RT-PCR analysis validated the overexpression of HOX gene family members in LSCC. Receiver operating characteristic
(ROC) statistical method curve showed that the expression level of seven members of HOX gene family can distinguish tumor from nontumor tissue. Correlation analysis of clinical and gene expression data revealed that HOXC8 and HOXD11 genes were associated with the differentiation degree of tumors and regional lymph node metastases, respectively. Additionally, siRNA assays confirmed that HOXC8, HOXD10, and HOXD11 genes might be critical for cell colony proliferation and cell migration. According to our findings, several members of the HOX genes were overexpressed in LSCC samples and seem to be required in biological processes involved in tumor development.

According to the news reporters, the research concluded: "This suggests that HOX genes might play a critical role in the physiopathology of LSCC tumors."

For more information on this research see: HOX genes: potential candidates for the progression of laryngeal squamous cell carcinoma. Tumor Biology. 2016;37(11):15087-15096. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

Genetics - Medical Genetics

Study Data from Radboud University Medical Center Update Understanding of Medical Genetics (Clinical delineation of the PACS1-related syndrome--Report on 19 patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Genetics - Medical Genetics have been published. According to news reporting from Nijmegen, Netherlands, by NewsRx journalists, research stated, "We report on 19 individuals with a recurrent de novo c.607C>T mutation in PACS1. This specific mutation gives rise to a recognizable intellectual disability syndrome."

Financial supporters for this research include Canadian Institutes of Health Research, Health Innovation Challenge Fund, Department of Health, and the Wellcome Trust Sanger Institute, National Institute for Health Research.

The news correspondents obtained a quote from the research from Radboud University Medical Center, "There is a distinctive facial appearance (19/19), characterized by full and arched eyebrows, hypertelorism with downslanting palpebral fissures, long eye lashes, ptosis, low set and simple ears, bulbous nasal tip, wide mouth with downturned corners and a thin upper lip with an unusual 'wavy' profile, flat philtrum, and diastema of the teeth. Intellectual
disability, ranging from mild to moderate, was present in all. Hypotonia is common in infancy (8/19). Seizures are frequent (12/19) and respond well to anticonvulsive medication. Structural malformations are common, including heart (10/19), brain (12/16), eye (10/19), kidney (3/19), and cryptorchidism (6/12 males). Feeding dysfunction is presenting in infancy with failure to thrive (5/19), gastroesophageal reflux (6/19), and gastrostomy tube placement (4/19). There is persistence of oral motor dysfunction."

According to the news reporters, the research concluded: "We provide suggestions for clinical work-up and management and hope that the present study will facilitate clinical recognition of further cases."

Our news journalists report that additional information may be obtained by contacting J.H. Schuurs-Hoeijmakers, Dept. of Human Genetics, Radboud University Medical Center, Nijmegen, Netherlands. Additional authors for this research include M.L. Landsverk, N. Foulds, M.K. Kukolich, R.H. Gavrilova, S. Greville-Heygate, A. Hanson-Kahn, J.A. Bernstein, J. Glass, D. Chitayat, T.A. Burrow, A. Husami, K. Collins, K. Wusik, N. van der Aa and F. Kooy.

Rotavirus
Study Data from Rega Institute for Medical Research Update Understanding of Rotavirus (Comparative analysis of pentavalent rotavirus vaccine strains and G8 rotaviruses identified during vaccine trial in Africa)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Rotavirus is now available. According to news reporting originating in Leuven, Belgium, by NewsRx journalists, research stated, "RotaTeqTM is a pentavalent rotavirus vaccine based on a bovine rotavirus genetic backbone in vitro reassorted with human outer capsid genes. During clinical trials of RotaTeqTM in Sub-Saharan Africa, the vaccine efficacy over a 2-year follow-up was lower against the genotypes contained in the vaccine than against the heterotypic G8P[6] and G8P[1] rotavirus strains of which the former is highly prevalent in Africa."

The news reporters obtained a quote from the research from Rega Institute for Medical Research, "Complete genome analyses of 43 complete rotavirus genomes collected during phase III clinical trials of RotaTeqTM in Sub-Saharan Africa, were conducted to gain insight into the high level of cross-protection afforded by RotaTeqTM against these G8 strains. Phylogenetic analysis revealed the presence of a high number of bovine rotavirus gene segments
in these human G8 strains. In addition, we performed an in depth analysis on the individual amino acid level which showed that G8 rotaviruses were more similar to the RotaTeq™ vaccine than non-G8 strains. Because RotaTeq™ possesses a bovine genetic backbone, the high vaccine efficacy against G8 strains might be partially explained by the fact that all these strains contain a complete or partial bovine-like backbone."

According to the news reporters, the research concluded: "Altogether, this study supports the hypothesis that gene segments other than VP7 and VP4 play a role in vaccine-induced immunity."

For more information on this research see: Comparative analysis of pentavalent rotavirus vaccine strains and G8 rotaviruses identified during vaccine trial in Africa. *Scientific Reports*, 2015;5():14658. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news correspondents report that additional information may be obtained by contacting E. Heylen, KU Leuven - University of Leuven, Dept. of Microbiology and Immunology, Laboratory for Clinical and Epidemiological virology, Rega Institute for Medical Research, Leuven, Belgium. **Transplant Medicine - Liver Transplants**

**Study Data from Regional Hospital Update Understanding of Liver Transpls (Acute Liver Failure Caused by Primary Non-Hodgkin's Lymphoma of the Liver)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transplant Medicine - Liver Transplants. According to news reporting out of Malaga, Spain, by NewsRx editors, research stated, "Acute liver failure (ALF) is a rare syndrome involving maximum liver dysfunction. This disease is characterized by a less than 26-week history of coagulopathy (INR >= 1.5) and hepatic encephalopathy and generally occurs in patients without any previously known disease."

Our news journalists obtained a quote from the research from Regional Hospital, "We report the case of a healthy 25-year-old subject who presented with fulminant liver failure caused by a primary non-Hodgkin's lymphoma of the liver that required emergency liver transplantation. Diagnosis was based on pathologic confirmation of T-cell/histiocyte-rich large B-cell lymphoma and submassive hepatocyte necrosis. One year after surgery, the patient remains in complete remission. Fulminant liver failure is a sudden-onset severe disease that can be caused by a primary non-Hodgkin's lymphoma of the liver, which accounts for <1% of extranodal lymphomas."

According to the news editors, the research concluded: "The diagnosis of this rare
disease demands high diagnostic suspicion, and progression can be prevented through liver transplantation."

Our news journalists report that additional information may be obtained by contacting L.R. Lopez, Reg Hosp, Liver Transplant Unit, Malaga, Spain. Additional authors for this research include F.J.L. Diaz, B.S. Perez, J.A.P. Daga, J.L.F. Aguilar, M.C.M. Casado, J.M.A. Narvaez, M.A.S. Munoz and J.S. Santoyo.

**Drugs and Therapies - In Vivo Diagnostic Biologicals**

**Study Data from Research Institute Update Knowledge of In Vivo Diagnostic Biologicals (L-Arginine L-Glutamate Enhances Gastric Motor Function in Rats and Dogs and Improves Delayed Gastric Emptying in Dogs)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - In Vivo Diagnostic Biologicals. According to news reporting originating from Kanagawa, Japan, by NewsRx correspondents, research stated, "Amino acids are not only constituents of proteins, but also have multiple physiologic functions. Recent findings have revealed that ingested amino acids either activate luminal receptors or are metabolized, causing physiologic reactions in the gastrointestinal (GI) tract."

Our news editors obtained a quote from the research from Research Institute, "We examined the effect of oral L-arginine L-glutamate (ArgGlu), a pharmaceutical amino acid salt used i.v. for the treatment of hyperammonemia, on gastric motor function in rats and dogs. Gastric emptying was determined using phenol red and C-13-breath test methods, whereas gastric relaxation was determined using the barostat method. ArgGlu (10-30 mg/kg, p.o.) dose-dependently promoted gastric emptying in rats. This effect was dependent on vagus nerve activation and comparable to that of the prokinetic mosapride. Intragastric ArgGlu (3-30 mg/kg intragastrically) also dose-dependently enhanced adaptive relaxation of rat stomachs, which was negated not by vagotomy of gastric branches, but by pretreatment with N omega-nitro-L-argininemethyl ester (20mg/kg i.v.), a nitric oxide synthase inhibitor. Its relaxing effect on the
stomach was also confirmed in dogs and was equally as efficacious as treatment with sumatriptan (1-3 mg/kg s.c.). ArgGlu (30mg/kg p.o.) significantly reduced the half gastric emptying time in clonidine-induced delayed gastric emptying of solids in dogs, and its effect was comparable to that of cisapride (3 mg/kg p.o.)."

According to the news editors, the research concluded: "This study demonstrated that the pharmaceutical ingredient ArgGlu, currently used i.v., enhanced gastric motor function when administered orally, suggesting that it could be a new oral medicine indicated for treatment of upper GI hypofunction or dysfunction like functional dyspepsia."

For more information on this research see: L-Arginine L-Glutamate Enhances Gastric Motor Function in Rats and Dogs and Improves Delayed Gastric Emptying in Dogs. Journal of Pharmacology and Experimental Therapeutics, 2016;359(2):238-246. Immunology - Antigen-Presenting Cells

Study Data from Research Institute Update Understanding of Antigen-Presenting Cells (Dendritic Cells and Cancer Immunity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immunology - Antigen-Presenting Cells have been presented. According to news reporting originating from Tampa, Florida, by NewsRx correspondents, research stated, "Dendritic cells (DCs) are central regulators of the adaptive immune response, and as such are necessary for T-cell-mediated cancer immunity."

Our news editors obtained a quote from the research from Research Institute, "In particular, antitumoral responses depend on a specialized subset of conventional DCs that transport tumor antigens to draining lymph nodes and cross-present antigen to activate cytotoxic T lymphocytes. DC maturation is necessary to provide costimulatory signals to T cells, but while DC maturation occurs within tumors, it is often insufficient to induce potent immunity, particularly in light of suppressive mechanisms within tumors."

According to the news editors, the research concluded: "Bypassing suppressive pathways or directly activating DCs can unleash a T-cell response, and although clinical efficacy has proven elusive, therapeutic targeting of DCs continues to hold translational potential in combinatorial approaches."

For more information on this research see: Dendritic Cells and Cancer Immunity. Trends in Immunology, 2016;37(12):855-865. Trends in Immunology can be contacted at:
Study Data from Royal Perth Hospital Update Knowledge of Antirheumatics (Abatacept experience in steroid and rituximab-resistant focal segmental glomerulosclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antirheumatics. According to news reporting out of Perth, Australia, by NewsRx editors, research stated, "Primary focal segmental glomerular sclerosis (FSGS), one of the major causes of nephrotic syndrome, eventually results in end-stage renal disease. Currently, FSGS is treated with immunosuppressive therapies, which include calcinuerin inhibitors (cyclosporine), glucocorticoids, B-cell depleting agents (rituximab) and, recently, a T-cell co-stimulatory inhibitor (abatacept)."

Our news journalists obtained a quote from the research from Royal Perth Hospital, "Until recently, there had been no cases reporting resistance to all current therapies. We report a case of a 62-year-old Caucasian man with biopsy-proven FSGS, who responded well to oral prednisolone therapy. However, 2 years later, he had a relapse and failed to respond to prednisolone. Subsequent treatments then included cyclosporine, rituximab and cyclophosphamide, which were not successful."

According to the news editors, the research concluded: "The patient was then administered abatacept, a novel T-cell co-stimulatory inhibitor-though he did not experience any side effects, there was no change in proteinuria nor in creatinine."

For more information on this research see: Abatacept experience in steroid and rituximab-resistant focal segmental glomerulosclerosis. Bmj Case Reports, 2016;2016():. (BMJ Publishing Group - group.bmj.com/; Bmj Case Reports - casereports.bmj.com/)

Our news journalists report that additional information may be obtained by contacting V.K. Jayaraman, Royal Perth Hospital, Perth, Western Australia, Australia.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1136/bcr-2016-214396. This DOI is a link to an online electronic document that is either free or for purchase.

Pregnancy Complications - Twin-to-Twin Transfusion…

Study Data from Royal Women's Hospital Provide New Insights into Twin-to-Twin Transfusion Syndrome [The Outcome of Monochorionic Diamniotic Twins Discordant at 11 to 13(+6) Weeks' Gestation]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Pregnancy Complications - Twin-to-Twin Transfusion Syndrome have been presented. According to news reporting from Melbourne, Australia, by NewsRx journalists, research stated, "Monochorionic diamniotic (MCDA) twin pregnancies are associated with adverse perinatal outcome. Intertwin discordances at the time of nuchal translucency (NT) screening may have a value in the prediction of fetal loss or twin-to-twin transfusion syndrome."

The news correspondents obtained a quote from the research from Royal Women's Hospital, "We aimed to determine the ability of intertwin NT and crown rump length (CRL) discordances among MCDA twins to predict adverse outcomes. All MCDA twins with a documented routine ultrasound at 11 to 13(+6) weeks' gestation, and known pregnancy outcome between August 2003 and August 2012 were included. Receiver operating characteristic curves were used to determine the ideal NT and CRL discordances cut-off points that maximized the ability to predict adverse outcome, which was defined as any of: death of one or both twins, twin-to-twin transfusion syndrome, or estimated fetal weight or birth weight discordances >= 25%. Of the 89 cases, 20 (22.5%) had at least one adverse outcome. NT discordance was more discriminatory of adverse outcome than was CRL discordance. The optimal values for predicting any adverse outcomes for NT were >23.7% and for CRL >3.5%. The positive predictive values for NT (52.4%) and CRL (29.8%) screening were relatively low; however, the lack of either NT or CRL discordances was more reassuring, with negative predictive values of 86.8% and 86.4%, respectively. NT discordance is more predictive for adverse fetal outcome in MCDA twins than CRL discordance."

According to the news reporters, the research concluded: "Neither NT nor CRL discordance are likely to modify the intensive monitoring required for these very high-risk pregnancies."

Our news journalists report that additional information may be obtained by contacting M.P. Umstad, Royal Womens Hosp, Div Matern Serv, Melbourne, Vic, Australia. Additional authors for this research include K. Reidy, T. Gilchrist, L.W. Doyle and M.P. Umstad.

Keywords for this news article include: Melbourne, Australia, Australia and New Zealand, CD20 Monoclonal Antibodies, Tyrosine Kinase Inhibitors.
Neurodegenerative Diseases and Conditions...

Study Data from Ruhr University Update Understanding of Huntington Disease (The search for modifier genes in Huntington disease Multifactorial aspects of a monogenic disorder)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurodegenerative Diseases and Conditions - Huntington Disease have been published. According to news reporting from Bochum, Germany, by NewsRx editors, the research stated, "It is becoming increasingly evident that the underlying mutation of a single locus is often insufficient for the prediction of the comprehensive phenotype in human Mendelian disorders, implicating that there is no clear distinction between monogenic and complex traits. By definition, monogenic traits show a classic pattern of inheritance and are strongly influenced by variation within a single gene."

The news correspondents obtained a quote from the research from Ruhr University, "However, many Mendelian traits that result in genetic disorders can have phenotypes that differ in subtle or profound ways such as severity, onset age and other associated phenotypic characteristics. Among the factors that may explain these differences in disease expression are modifier genes. This review focuses on the role of modifier genes using the example of Huntington Disease (HD), an autosomal dominantly transmitted, progressive neurodegenerative disorder."

According to the news reporters, the research concluded: "The advantages and limitations of candidate gene approaches versus genome-wide association studies (GWAS) as well as its implications for diagnostic, prognostic, and therapeutic interventions are discussed."

Our news journalists report that additional information may be obtained by contacting L. Arning, Ruhr University of Bochum, Dept. of Human Genet, Bochum, Germany.

Keywords for this news article include: Bochum, Germany, Europe, Neurodegenerative Diseases and Conditions, Article Review, Genetics, Central Nervous System Diseases and Conditions, Nervous System Heredodegenerative Disorders, Basal Ganglia Diseases and Conditions, Brain Diseases and Conditions, Cognition Disorders, Huntington Disease, Movement Disorders, Dyskinesias, Dementia, Chorea, Ruhr University.

Study Data from S. Wang and Colleagues Update Understanding of CD Antigens [Intratumoral injection of a CpG oligonucleotide reverts resistance to PD-1 blockade by expanding multifunctional CD8(+) T cells]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immunology - CD Antigens have been presented. According to news reporting from Berkeley, California, by NewsRx journalists, research stated, "Despite the impressive rates of clinical response to programmed death 1 (PD-1) blockade in multiple cancers, the majority of patients still fail to respond to this therapy. The CT26 tumor in mice showed similar heterogeneity, with most tumors unaffected by anti-PD-1."

The news correspondents obtained a quote from the research, "As in humans, response of CT26 to anti-PD-1 correlated with increased T- and B-cell infiltration and IFN expression. We show that intratumoral injection of a highly interferogenic TLR9 agonist, SD-101, in anti-PD-1 nonresponders led to a complete, durable rejection of essentially all injected tumors and a majority of uninjected, distant-site tumors. Therapeutic efficacy of the combination was also observed with the TSA mammary adenocarcinoma and MCA38 colon carcinoma tumor models that show little response to PD-1 blockade alone. Intratumoral SD-101 substantially increased leukocyte infiltration and IFN-regulated gene expression, and its activity was dependent on CD8(+) T cells and type I IFN signaling. Anti-PD-1 plus intratumoral SD-101 promoted infiltration of activated, proliferating CD8(+) T cells and led to a synergistic increase in total and tumor antigen-specific CD8(+) T cells expressing both IFN-gamma and TNF-alpha. Additionally, PD-1 blockade could alter the CpG-mediated differentiation of tumor-specific CD8+ T cells into CD127(low)KLRG1(high) short-lived effector cells, preferentially expanding the CD127(high)KLRG1(low) long-lived memory precursors. Tumor control and intratumoral T-cell proliferation in response to the combined treatment is independent of T-cell trafficking from secondary lymphoid organs."

According to the news reporters, the research concluded: "These findings suggest that a CpG oligonucleotide given intratumorally may increase the response of cancer patients to PD-1 blockade, increasing the quantity and the quality of tumor-specific CD8(+) T cells."

Our news journalists report that additional information may be obtained by contacting R.L. Coffman, Dynavax Technol Corp, Discovery, Berkeley, CA 94710, United States. Additional authors for this research include J. Campos, M. Gallotta, M. Gong, C. Crain, E. Naik, R.L. Coffman and C. Guiducci.

Keywords for this news article include: Berkeley, California, United States, North and Central America, T-Lymphocyte Antigens, Biological Factors, Differentiation, CD8 Antigens, CD Antigens, Immunology, Genetics.

Immunology - Mononuclear Phagocyte System

Study Data from S. Wang et al Provide New Insights into Mononuclear Phagocyte System (Serum Amyloid a Promotes Visfatin Expression in Macrophages)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immunology - Mononuclear Phagocyte System have been presented. According to news reporting originating in Weifang, People's Republic of China, by NewsRx journalists, research stated, "Visfatin has been reported to exert an important role in the development of atherosclerosis. However, the mechanism that regulated the expression of Visfatin has not been elucidated yet."

Financial support for this research came from Weifang Science and Technology Development Plan.

The news reporters obtained a quote from the research, "This study aimed to investigate the effect of SAA on the regulation of Visfatin, as well as the potential pathway. After RAW264.7 macrophages and primary monocytes were stimulated with SAA, the mRNA and protein expression of Visfatin was detected with real-time PCR and western blot, respectively. The concentration of Visfatin in the supernatant was measured with ELISA. Formyl peptide receptor 2 (FPR2) agonist (WKYMVm) and inhibitor (WRW(4)), extracellular signal-regulated kinase 1/2 (ERK1/2) inhibitor (PD98059), and peroxisome proliferator-activated receptor-g (PPAR-g) agonist (Rosiglitazone) and inhibitor (GW9662) were used to investigate the mechanism of regulation of Visfatin. The results demonstrated that SAA upregulated Visfatin expression in cultured RAW264.7 macrophages and in the primary monocytes. WRW(4) decreased SAA-induced Visfatin production, while WKYMVm could induce Visfatin expression. PD98059 reduced SAA-induced Visfatin production. What is more, GW9662 inhibited SAA-induced Visfatin production, while Rosiglitazone promoted Visfatin expression."

According to the news reporters, the research concluded: "These results demonstrate that SAA upregulates Visfatin expression via a FPR2/ERK1/2/PPAR-g signaling pathway."

For more information on this research see: Serum Amyloid a Promotes Visfatin Expression in Macrophages. Biomed Research International, 2016;2016():4819327.

Our news correspondents report that additional information may be obtained by contacting S. Wang, Dept. of Cardiology II, Weifang People's Hospital, Weifang 261041, People's Republic of China. Additional authors for this research include X. Zhang and L. Tan.

Gram-Negative Bacteria - Klebsiella

Study Data from S.K. Singh et al Provide New Insights into Klebsiella (blaOXA-48 carrying clonal colistin resistant-carbapenem resistant Klebsiella pneumoniae in neonate intensive care unit, India)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Negative Bacteria - Klebsiella is now available. According to news reporting from Jamshedpur, India, by NewsRx journalists, research stated, "Bacteria resistant to colistin, a last resort antibiotic reflect the pre-antibiotic era."

The news correspondents obtained a quote from the research, "In this study, colistin resistance carbapenem-resistant K. pneumoniae (COLR-CRKP) strains from neonate's intensive care unit were evaluated. Molecular analysis showed that all the four colistin resistant K. pneumoniae isolates were clonally related with strong biofilm formation ability and harbored bla (SHV-34) and bla(OXA-48) genes."

According to the news reporters, the research concluded: "Our result suggested the need of proper surveillance and adequate infection control to limiting the spread of these organisms."

For more information on this research see: blaOXA-48 carrying clonal colistin resistant-carbapenem resistant Klebsiella pneumoniae in neonate intensive care unit, India. Heart Disorders and Diseases - Acute Coronary...

Study Data from Shaheed Beheshti University of Medical Sciences Provide New Insights into Acute Coronary Syndrome (Genetic variants and expression study of FOXP3 gene in acute coronary syndrome in Iranian patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Acute Coronary Syndrome...
is now available. According to news reporting originating in Tehran, Iran, by NewsRx journalists, research stated, "Acute coronary syndrome (ACS) is the most serious form of coronary artery disease. Inflammatory processes participate in different stages of this disorder."

The news reporters obtained a quote from the research from the Shaheed Beheshti University of Medical Sciences, "FOXP3 gene plays an important role for the development and function of regulatory T cells. Consequently, the expression level and polymorphisms of this gene have been studied in many immune related diseases. In the present study, we analysed the expression of FOXP3 as well as the association between two variants in this gene (rs3761548A/C and rs5902434del/ATT) and occurrence of ACS in Iranian patients. FOXP3 expression analysis showed a significant decrease in patients with ACS compared with controls (p=0.029). In addition, a significant decrease has been detected in female patients compared with normal female subjects (p=0.020). No significant change has been observed in FOXP3 expression in male patients compared with normal male subjects. In addition, no difference has been detected between ACS and normal subjects in combined genotype frequencies of both polymorphisms and the allele frequencies of rs5902434. However, rs3761548 C allele was more prevalent in controls compared with patients with ACS (p=0.024). Consequently, our data demonstrated that FOXP3 expression is markedly decreased in female patients with ACS, which highlight the role of immune responses in plaque destabilization in such patients. Copyright © 2016 John Wiley & Sons, Ltd. Considering the role of immune system in different stages of acute coronary syndrome (ACS), we evaluated the expression of FOXP3 gene as a master regulator of immune response in these patients compared with normal subjects. We detected a significant down-regulation of this gene in patients with ACS."

According to the news reporters, the research concluded: "Such decreased expression was more prominent in female patients, which implies the role of immune responses in plaque destabilization in such patients."

Our news correspondents report that additional information may be obtained by contacting M. Gholami, Dept. of Medical Genetics, School of Medicine, Shahid Beheshti University of Medical Sciences, Tehran, Iran. Additional authors for this research include A. Esfandiary, M. Vatanparast, R. Mirfakhraie, M.M. Hosseini and S. Ghafoori-Fard.

Study Data from Shanghai Jiao-Tong University Update Knowledge of Plastic Surgery (Intravenous Hyaluronidase with Urokinase as Treatment for Rabbit Retinal Artery Hyaluronic Acid Embolism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Surgery - Plastic Surgery. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Although various salvage methods have been proposed to treat intraretinal artery hyaluronic acid embolism, their applications are still limited by various factors. The authors investigated the effectiveness of intravenous hyaluronidase with urokinase for resolving retinal artery hyaluronic acid embolism."

Our news editors obtained a quote from the research from Shanghai Jiao-Tong University, "The anatomy of rabbit ophthalmic and fundus arteries (retinal and choroid artery) was studied. Approximately 0.35 ml of hyaluronic acid was injected into the ophthalmic artery to create a retinal artery embolism model. The rabbits were grouped randomly (groups A, B, C, D, E, and F) and given hyaluronidase with urokinase intravenously at different postobstruction time points (10, 20, 30, 40, 50, and 60 minutes). Saline was given to the control group. Fundus vascular (retinal and choroid artery) reperfusion status and the effectiveness of the solution on the obstruction of each group were observed for 5 days. The animal model closely imitated actual hyaluronic acid ophthalmic/retinal artery obstructions. Three vascular conditions were observed after hyaluronidase with urokinase injection: total, partial, and no reperfusion. Groups A, B, and C showed a significantly higher overall solution effectiveness rate (total/partial reperfusion) compared with the control group (p = 0.001, p = 0.001, and p = 0.005, respectively). Solution effectiveness in groups D, E, and F showed no difference compared with the control group (p = 0.628, p = 1.000, and p = 1.000, respectively). The effectiveness of the solution drops dramatically if given after 30 minutes of obstruction. The authors' method can indeed help resolve retinal artery hyaluronic acid obstruction."

According to the news editors, the research concluded: "Intravenous hyaluronidase with urokinase technique shows possible potential to become a standardized treatment protocol for intraretinal artery hyaluronic acid embolism with further clinical tests."

For more information on this research see: Intravenous Hyaluronidase with Urokinase as Treatment for Rabbit Retinal Artery Hyaluronic Acid Embolism. Plastic and Reconstructive Surgery, 2016;138(6):1221-1229. Oncology - Glioblastomas

Study Data from Shantou University Update Understanding of Glioblastomas (Histone Deacetylase Inhibitor RGFP109 Overcomes Temozolomide Resistance by Blocking NF-kappa B-Dependent Transcription in Glioblastoma Cell Lines)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Glioblastomas have been presented. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Glioblastoma (GBM) is the most frequent and aggressive tumour in the central nervous system. Many studies have demonstrated that upregulation of the NF-kappa B onco-pathway is accompanied by the acquisition of Temozolomide (TMZ) resistance in GBM cells."

The news correspondents obtained a quote from the research from Shantou University, "Here, we show that RGFP109, a selective histone deacetylase (HDAC1 and HDAC3) inhibitor, overcomes TMZ resistance and downregulates the expression of NF-kappa B-regulated pro-survival genes in a TMZ-resistant (TR) GBM cell line. RGFP109 did not alter the phosphorylation levels of NF-kappa B/p65 or inhibitory kappa B alpha (I kappa B alpha). Immunofluorescence microscopy showed that RGFP109 does not block the nuclear translocation of NF-kappa B/p65. However, co-immunoprecipitation assays revealed that RGFP109 induces the hyperacetylation of NF-kappa B/p65 and histones, and blocks interactions between NF-kappa B/p65 and its coactivators, p300 and p300/CBP-associated factor (PCAF). These results indicate that RGFP109-mediated post-translational nuclear acetylation may be involved in the regulation of NF-kappa B. Electrophoretic mobility shift assays revealed that RGFP109 reduces NF-kappa B/p65 binding to kappa B-DNA and decreased the transcriptional level of kappa B-mediated genes, suggesting that RGFP109-induced hyperacetylation leads to attenuated transcription of the kappa B gene. In addition, RGFP109 elevates the expression of inhibitor of growth 4 (ING4), which is typically downregulated in GBM cells. Importantly, we found that RGFP109 enhances ING4 recognition and binding to NF-kappa B/p65, which may be positively correlated with reduced interactions between NF-kappa B/p65 and p300/PCAF, thereby effecting transcription of the kappa B gene. Finally, we show that knockdown of ING4 with plasmids containing pcDNA3.1-ING4 shRNA abolished the effect of RGFP109. Therefore, ING4 may act as a corepressor and facilitate RGFP109-triggered suppression of the NF-kappa B pathway."

According to the news reporters, the research concluded: "Taken together, our data show that RGFP109, an HDAC inhibitor, in combination with TMZ may be a therapeutic candidate for patients with temozolomide-resistant GBM."

Our news journalists report that additional information may be obtained by contacting W.P. Li, Shantou University, Coll Med, Shantou, Guangdong, People's Republic of China. Additional authors for this research include Q.Z. Li, L. Chen, B.D. Chen, B. Wang, X.J.
Study Data from Shengjing Hospital Provide New Insights into Gastric Cancer (Parity and gastric cancer risk: a systematic review and dose-response meta-analysis of prospective cohort studies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Gastric Cancer. According to news originating from Shenyang, People's Republic of China, by NewsRx correspondents, research stated, "We performed this meta-analysis of epidemiological studies to comprehensively assess the association between parity and gastric cancer risk, because previous studies have shown conflicting results regarding this topic. Relevant prospective studies were identified by searching the following databases: PubMed, EMBASE, and Web of Science, and random-effects models were used to estimate summary relative risks (SRRs) and 95% confidence intervals (CIs)."

Our news journalists obtained a quote from the research from Shengjing Hospital, "Our search yielded 10 prospective cohort studies involving a total of 6624 gastric cancer cases and 5,559,695 non-cases. The SRRs for ever parity vs. nulliparous and highest vs. lowest parity number were 0.96 (95%CI=0.87-1.05, I(2)=0%) and 1.03 (95%CI=0.94-1.13, I(2)=0%), respectively. Additionally, the SRR for an increment of one live birth was 1.00 (95%CI=0.97-1.03, I(2)=18.6%). These non-significant associations were observed in all subgroups as stratified by the number of gastric cases, follow-up years, geographic location, menopausal status, anatomic subsite of gastric cancer, and adjustment for potential confounders, as well as in sensitivity analyses. Our meta-analysis found no significant association between parity and gastric cancer risk."

According to the news editors, the research concluded: "However, further studies should be conducted to validate our findings and could provide more detailed results by stratifying their findings by Lauren's subtype, histology, and anatomic site, as well as fully adjusting for potential confounding factors."

For more information on this research see: Parity and gastric cancer risk: a systematic review and dose-response meta-analysis of prospective cohort studies. Scientific Reports, 2016;6():18766. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from J. Chen, Dept. of Obstetrics and Gynecology, Shengjing Hospital of China Medical University, Shenyang, People's Republic of China. Additional authors for this research include T.T. Gong and Q.J Wu.

Oncology - Liver Cancer

Study Data from Sichuan University Update Knowledge of Liver Cancer (Cost-effectiveness analysis of antiviral therapy in patients with advanced hepatitis B virus-related hepatocellular carcinoma treated with sorafenib)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Cancer have been published. According to news reporting from Chengdu, People's Republic of China, by NewsRx journalists, research stated, "Antiviral therapy has been demonstrated to significantly improve the survival in patients with advanced hepatitis B virus (HBV)-related hepatocellular carcinoma (HCC). The aim of the study was to investigate the cost-effectiveness of antiviral therapy in patients with advanced HBV-related HCC treated with sorafenib."

The news correspondents obtained a quote from the research from Sichuan University, "To conduct the analysis, a Markov model comprising three health states (progression-free survival, progressive disease, and death) was created. The efficacy data were derived from medical records. Cost data were collected based on the Chinese national drug prices. Utility data came from the previously published studies. One-way sensitivity analyses as well as probabilistic sensitivity analyses were performed to explore model uncertainties. In the base-case analysis, addition of antiviral therapy to sorafenib generated an effectiveness of 0.68 quality-adjusted life years (QALYs) at a cost of $25,026.04, while sorafenib monotherapy gained an effectiveness of 0.42 QALYs at a cost of $20,249.64. The incremental cost-effectiveness ratio (ICER) was $18,370.77/QALY for antiviral therapy group versus non-antiviral therapy group. On the other hand, the ICER between the two groups in patients with high or low HBV-DNA load, with or without cirrhosis, normal or elevated alanine aminotransferase/aspartate aminotransferase were $16,613.97/QALY, $19,774.16/QALY, $14,587.66/QALY, $19,873.84/QALY, $17,947.07/QALY, and $18,785.58/QALY, respectively."

According to the news reporters, the research concluded: "Based on the cost-effectiveness threshold ($20,301.00/QALY in China), addition of antiviral therapy to sorafenib is considered to be a cost-effective option compared with sorafenib monotherapy in patients with advanced HBV-related HCC treated with sorafenib."

Our news journalists report that additional information may be obtained by contacting Q. Li, Sichuan University, West China Biostat & Cost Benefit Anal Center, Chengdu, Sichuan, People's Republic of China. Additional authors for this research include Y. Yang, F. Wen, J. Wheeler, P. Fu and Q. Li.

Dentistry

Study Data from Sichuan University Update Understanding of Dentistry (Epigenetic regulation in dental pulp inflammation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Dentistry is the subject of a report. According to news reporting from Chengdu, People's Republic of China, by NewsRx journalists, research stated, "Dental caries, trauma, and other possible factors could lead to injury of the dental pulp. Dental infection could result in immune and inflammatory responses mediated by molecular and cellular events and tissue breakdown."

Funders for this research include National Natural Science Foundation of China, Innovation Team of Sichuan Province, China Scholarship Council.

The news correspondents obtained a quote from the research from Sichuan University. "The inflammatory response of dental pulp could be regulated by genetic and epigenetic events. Epigenetic modifications play a fundamental role in gene expression. The epigenetic events might play critical roles in the inflammatory process of dental pulp injury. Major epigenetic events include methylation and acetylation of histones and regulatory factors, DNA methylation, and small non-coding RNAs. Infections and other environmental factors have profound effects on epigenetic modifications and trigger diseases. Despite growing evidences of literatures addressing the role of epigenetics in the field of medicine and biology, very little is known about the epigenetic pathways involved in dental pulp inflammation. This review summarized the current knowledge about epigenetic mechanisms during dental pulp inflammation."

According to the news reporters, the research concluded: "Progress in studies of epigenetic alterations during inflammatory response would provide opportunities for the development of efficient medications of epigenetic therapy for pulpitis."

Our news journalists report that additional information may be obtained by contacting T. Hui, State Key Laboratory of Oral Diseases, West China Hospital of Stomatology, Sichuan University, Chengdu, Sichuan, People's Republic of China. Additional authors for this

Mental Health Diseases and Conditions - Depression

Study Data from Southeast University Update Knowledge of Depression (Divergent topological architecture of the default mode network as a pretreatment predictor of early antidepressant response in major depressive disorder)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mental Health Diseases and Conditions - Depression. According to news reporting from Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Identifying a robust pretreatment neuroimaging marker would be helpful for the selection of an optimal therapy for major depressive disorder (MDD). We recruited 82 MDD patients [n = 42 treatment-responsive depression (RD) and n = 40 non-responding depression (NRD)] and 50 healthy controls (HC) for this study."

The news correspondents obtained a quote from the research from Southeast University, "Based on the thresholded partial correlation matrices of 58 specific brain regions, a graph theory approach was applied to analyse the topological properties. When compared to HC, both RD and NRD patients exhibited a lower nodal degree (D-nodal) in the left anterior cingulate gyrus; as for RD, the Dnodal of the left superior medial orbitofrontal gyrus was significantly reduced, but the right inferior orbitofrontal gyrus was increased (all P< 0.017, FDR corrected). Moreover, the nodal degree in the right dorsolateral superior frontal cortex (SFGdor) was significantly lower in RD than in NRD. Receiver operating characteristic curve analysis demonstrated that the and nodal degree in the right SFGdor exhibited a good ability to distinguish nonresponding patients from responsive patients, which could serve as a specific maker to predict an early response to antidepressants."

According to the news reporters, the research concluded: "The disrupted topological configurations in the present study extend the understanding of pretreatment neuroimaging predictors for antidepressant medication."

For more information on this research see: Divergent topological architecture of the default mode network as a pretreatment predictor of early antidepressant response in major depressive disorder. Scientific Reports, 2016;6():1-9. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Systemic Lupus Erythematosus

Study Data from Southern Medical University Update Understanding of Systemic Lupus Erythematosus (Suppression of interleukin 17 contributes to the immunomodulatory effects of adipose-derived stem cells in a murine model of systemic lupus ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Systemic Lupus Erythematosus are discussed in a new report. According to news originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Due to roles in immunoregulation and low immunogenicity, mesenchymal stem cells have been suggested to be potent regulators of the immune response and may represent promising treatments for autoimmune disease. Adipose-derived stem cells (ADSCs), stromal cells derived from adipose tissue, were investigated with allogeneic ADSCs in B6.MRL/lpr mice, a murine model of systemic lupus erythematosus (SLE)."

Our news journalists obtained a quote from the research from Southern Medical University, "We intravenously injected allogeneic ADSCs into SLE mice after disease onset and report that ADSCs reduced anti-ds DNA antibodies in serum and proteinuria in SLE mice. ADSCs alleviated renal damage and inflammatory cell infiltration and edema of the renal interstitium. Furthermore, ADSCs significantly downregulated renal IL-17 and CD68 expression, suggesting that ADSCs suppressed renal inflammation. ADSCs also decreased IL-17 mRNA expression and increased Foxp3, ROR-gamma t and miR-23b mRNA expression in renal tissue in SLE mice. ADSCs reduced renal protein expression of TAB 2 and IKK-alpha in SLE mice."

According to the news editors, the research concluded: "Thus, ADSCs may be a novel potential therapy for treating SLE."

For more information on this research see: Suppression of interleukin 17 contributes to the immunomodulatory effects of adipose-derived stem cells in a murine model of systemic lupus erythematosus. Immunologic Research, 2016;64(5-6):1157-1167. Immunologic Research can be contacted at: Humana Press Inc, 999 Riverview Drive Suite 208, Totowa, NJ 07512, USA. Cardiopulmonary Bypass

Study Data from St. George Hospital Update Understanding of Cardiopulmonary Bypass (Simulator Teaching of Cardiopulmonary Bypass Complications: A Prospective, Randomized Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiopulmonary Bypass have been published. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "Complications of cardiopulmonary bypass (CPB) are rare, but life-threatening events that need prompt and rehearsed actions involving a team. This is not adequately taught to cardiothoracic surgical trainees."

The news correspondents obtained a quote from the research from St. George Hospital, "The objective of this study was to assess the knowledge of cardiothoracic trainees required to manage these events after simulation-based vs. lecture-based teaching. Totally, 17 cardiac surgical trainees with no formal teaching in intraoperative complications of CPB management were randomly assigned by computer to either a study group receiving simulation-based complications of CPB teaching via the Orpheus simulator (n = 9) or a control group receiving complications of CPB teaching via a lecture (n = 8). Each subject undertook a written test comprising 20 multiple choice questions on complications of CPB before and after teaching. Trainees were then asked to rate their satisfaction with each session from 1 to 5, with 5 being most satisfied. St George Simulation and Clinical Skills Laboratory, St George's Hospital, London. There was no significant difference in the pretest scores between the 2 groups (p = 0.29). After teaching, both groups showed a statistically significant improvement in their knowledge (p < 0.05). The trainees in the simulation group performed better than the lecture-based group; however, this was not statistically significant (p = 0.21). Satisfaction levels in both the lecture session and the simulation session were very high with means of 4.4/5 and 4.8/5, respectively. Despite the familiarity with CPB during surgery, the simulation group performed at least as well as the lecture group."

According to the news reporters, the research concluded: "Cardiothoracic trainees would benefit from formal teaching of complications of CPB management via either learning modality being incorporated into their training."

Our news journalists report that additional information may be obtained by contacting M. Jahangiri, St George Hosp, Dept. of Cardiothorac Surg, London SW17 0QT, United Kingdom. Additional authors for this research include S. Phillips, C. Hamilton, P. Fricker, D. Spray, J.L. Nowell and M. Jahangiri.

Drugs and Therapies - Influenza Therapy

Study Data from St. Jude Children's Research Hospital Update

Knowledge of Influenza Therapy (A Novel Endonuclease Inhibitor Exhibits Broad-Spectrum Anti-Influenza Virus Activity In Vitro)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Influenza Therapy. According to news reporting from Memphis, Tennessee, by NewsRx journalists, research stated, "Antiviral drugs are important in preventing and controlling influenza, particularly when vaccines are ineffective or unavailable. A single class of antiviral drugs, the neuraminidase inhibitors (NAIs), is recommended for treating influenza."

Financial support for this research came from HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID).

The news correspondents obtained a quote from the research from St. Jude Children's Research Hospital, "The limited therapeutic options and the potential risk of antiviral resistance are driving the search for additional small-molecule inhibitors that act on influenza virus proteins. The acid polymerase (PA) of influenza viruses is a promising target for new antivirals because of its essential role in initiating virus transcription. Here, we characterized a novel compound, RO-7, identified as a putative PA endonuclease inhibitor. RO-7 was effective when added before the cessation of genome replication, reduced polymerase activity in cell-free systems, and decreased relative amounts of viral mRNA and genomic RNA during influenza virus infection. RO-7 specifically inhibited the ability of the PA endonuclease domain to cleave a nucleic acid substrate. RO-7 also inhibited influenza A viruses (seasonal and 2009 pandemic H1N1 and seasonal H3N2) and B viruses (Yamagata and Victoria lineages), zoonotic viruses (H5N1, H7N9, and H9N2), and NAI-resistant variants in plaque reduction, yield reduction, and cell viability assays in Madin-Darby canine kidney (MDCK) cells with nanomolar to submicromolar 50% effective concentrations (EC(50)s), low toxicity, and favorable selective indices. RO-7 also inhibited influenza virus replication in primary normal human bronchial epithelial cells."

According to the news reporters, the research concluded: "Overall, RO-7 exhibits broad-spectrum activity against influenza A and B viruses in multiple in vitro assays, supporting its further characterization and development as a potential antiviral agent for treating influenza."

**Immune System Diseases and Conditions - HIV/AIDS**

**Study Data from St. Louis University Update Knowledge of HIV/AIDS (Geographic Variation in Condom Availability and Accessibility)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immune System Diseases and Conditions - HIV/AIDS have been published. According to news reporting originating from St. Louis, Missouri, by NewsRx correspondents, research stated, "Identifying predictors that contribute to geographic disparities in sexually transmitted infections (STIs) is necessary in order to reduce disparities. This study assesses the spatial relationship condom availability and accessibility in order to better identify determinants of geographic disparities in STIs."

Our news editors obtained a quote from the research from St. Louis University, "We conducted a telephone-based audit among potential-condom selling establishments. Descriptive analyses were conducted to detect differences in condom-selling characteristics by stores and by store type. Geocoding, mapping, and spatial analysis were conducted to measure the availability of condoms. A total of 850 potential condom-selling establishments participated in the condom availability and accessibility audit in St. Louis city; 29 % sold condoms. There were several significant geographic clusters of stores identified across the study area. The first consisted of fewer convenience stores and gas stations that sold condoms in the northern section of the city, whereas condoms were less likely to be sold in non-convenience store settings in the southwestern and central parts of the city. Additionally, locations that distributed free condoms clustered significantly in city center. However, there was a dearth of businesses that were neither convenience stores nor gas stations in the northern region of the city, which also had the highest concentration of condoms sold."

According to the news editors, the research concluded: "This initial study was conducted to provide evidence that condom availability and accessibility differ by geographic region, and likely are a determinant of social norms surrounding condom use and ultimately impact STI rates."

For more information on this research see: Geographic Variation in Condom Availability and Accessibility. *AIDS and Behavior*, 2016;20(12):2863-2872. *AIDS and Behavior* can be contacted at: Springer, Plenum Publishers, 233 Spring St, New York, NY 10013, USA. Health and Medicine - Endocrinology

Study Data from State University of Campinas Update Knowledge of Endocrinology (408 Cases of Genital Ambiguity Followed by Single Multidisciplinary Team during 23 Years: Etiologic Diagnosis and Sex of Rearing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Health and Medicine - Endocrinology. According to news reporting from Campinas, Brazil, by NewsRx journalists, research stated, "To evaluate diagnosis, age of referral, karyotype, and sex of rearing of cases with disorders of sex development (DSD) with ambiguous genitalia. Retrospective study during 23 years at outpatient clinic of a referral center."

Funders for this research include Fundacao de Amparo a Pesquisa do Estado de Sao Paulo, Conselho Nacional de Desenvolvimento Cientifico e Tecnologico.

The news correspondents obtained a quote from the research from the State University of Campinas, "There were 408 cases; 250 (61.3%) were 46, XY and 124 (30.4%) 46, XX and 34 (8.3%) had sex chromosomes abnormalities. 189 (46.3%) had 46, XY testicular DSD, 105 (25.7%) 46, XX ovarian DSD, 95 (23.3%) disorders of gonadal development (DGD), and 19 (4.7%) complexmalformations. Themain etiology of 46, XX ovarian DSD was salt-wasting 21-hydroxylase deficiency. In 46, XX and 46, XY groups, other malformations were observed. In the DGD group, 46, XY partial gonadal dysgenesis, mixed gonadal dysgenesis, and ovo-testicular DSD were more frequent. Low birth weight was observed in 42 cases of idiopathic 46, XY testicular DSD. The average age at diagnosis was 31.7 months. The final sex of rearing was male in 238 cases and female in 170. Only 6.6% (27 cases) needed sex reassignment. In this large DSD sample with ambiguous genitalia, the 46, XY karyotype was the most frequent; in turn, congenital adrenal hyperplasia was the most frequent etiology."

According to the news reporters, the research concluded: "Malformations associated with DSD were common in all groups and low birth weight was associated with idiopathic 46, XY testicular DSD."

For more information on this research see: 408 Cases of Genital Ambiguity Followed by Single Multidisciplinary Team during 23 Years: Etiologic Diagnosis and Sex of Rearing. International Journal of Endocrinology, 2016(;):1-9. International Journal of Endocrinology can be contacted at: Hindawi Publishing Corp, 315 Madison Ave 3RD Flr, Ste
Gram-Negative Bacteria - Pseudomonas aeruginosa

Study Data from State University of New York Update Understanding of Pseudomonas aeruginosa (Chemical Inhibition of Kynureninase Reduces Pseudomonas aeruginosa Quorum Sensing and Virulence Factor Expression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Gram-Negative Bacteria - Pseudomonas aeruginosa is the subject of a report. According to news reporting out of Albany, New York, by NewsRx editors, research stated, "The opportunistic pathogen Pseudomonas aeruginosa utilizes multiple quorum sensing (QS) pathways to coordinate an arsenal of virulence factors. We previously identified several cysteine-based compounds inspired by natural products from the plant Petiveria alliacea which are capable of antagonizing multiple QS circuits as well as reducing P. aeruginosa biofilm formation."

Financial supporters for this research include Division of Chemistry, NIH Office of the Director.

Our news journalists obtained a quote from the research from the State University of New York, "To understand the global effects of such compounds on virulence factor production and elucidate their mechanism of action, RNA-seq transcriptomic analysis was performed on P. aeruginosa PAO1 exposed to S-phenyl-l-cysteine sulfoxide, the most potent inhibitor from the prior study. Exposure to this inhibitor down-regulated expression of several QS-regulated virulence operons (e.g., phenazine biosynthesis, type VI secretion systems). Interestingly, many genes that were differentially regulated pertain to the related metabolic pathways that yield precursors of pyochelin, tricarboxylic acid cycle intermediates, phenazines, and Pseudomonas quinolone signal (PQS). Activation of the MexT-regulon was also indicated, including the multidrug efflux pump encoded by mexEF-oprN, which has previously been shown to inhibit QS and pathogenicity. Deeper investigation of the metabolites involved in these systems revealed that S-phenyl-l-cysteine sulfoxide has structural similarity to kynurenine, a precursor of anthranilate, which is critical for P. aeruginosa virulence. By supplementing exogenous anthranilate, the QS-inhibitory effect was reversed. Finally, it was shown that S-phenyl-l-
cysteine sulfoxide competitively inhibits \textit{P. aeruginosa} kynureninase (KynU) activity in vitro and reduces PQS production in vivo."

According to the news editors, the research concluded: "The kynurenine pathway has been implicated in \textit{P. aeruginosa} QS and virulence factor expression; however, this is the first study to show that targeted inhibition of KynU affects \textit{P. aeruginosa} gene expression and QS, suggesting a potential antivirulence strategy."

For more information on this research see: Chemical Inhibition of Kynureninase Reduces Pseudomonas aeruginosa Quorum Sensing and Virulence Factor Expression. \textit{Acs Chemical Biology}, 2016;11(4):1106-17. (American Chemical Society - www.acs.org; Acs Chemical Biology - www.pubs.acs.org/journal/acbcct)

Our news journalists report that additional information may be obtained by contacting S.H. Kasper, Colleges of Nanoscale Science and Engineering, SUNY Polytechnic Institute, Albany, New York, United States. Additional authors for this research include R.P. Bonocora, J.T. Wade, R.A. Musah and N.C. Cady.

\textbf{Oncology - Liver Cancer}

\textbf{Study Data from Sungkyunkwan University Update Knowledge of Liver Cancer (Preoperative depressed mood and perioperative heart rate variability in patients with hepatic cancer)}

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Liver Cancer is the subject of a report. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "How perioperative heart rate variability (HRV) indices differ according to the anxiety or depressed mood of patients scheduled to undergo a major surgical procedure for cancer. Prospective observational study. Operating room."

Financial support for this research came from Sungkyunkwan University School of Medicine.

Our news journalists obtained a quote from the research from Sungkyunkwan University, "Forty-one male patients between 40 and 70 years of age with hepatocellular carcinoma were included in the final analysis. HRV was measured on the day before surgery (T1), impending anesthesia (T2), and after anesthetic induction (T3). Preoperative anxiety and depressed mood of all patients were evaluated using the State-Trait Anxiety Inventory and Self-Rating Depression Scale (SDS). HRV was significantly different among T1, T2, and T3. At T2, high frequency (HF) (normalized units of HF [nuHF]) was decreased and low frequency (LF) (normalized units of LF) and LF/HF were increased compared with those at T1 and T3. In the
subgroup analysis between high and low SDS groups, high SDS group showed significantly decreased nuHF (P = .035), increased nuLF (P = .039), and increased LF/HF (P = .020) compared to low SDS group at T1. However, these values at T2 and T3 were not different between 2 groups. In analysis within the groups, low SDS group showed significant differences in nuHF, nuLF, and LF/HF among T1, T2, and T3 (P < .05, respectively), but no changes in these values were observed in high SDS group among the 3 different time points. HRV decreased significantly immediately before anesthes ia and recovered to baseline with anesthetic induction."

According to the news editors, the research concluded: "Preoperative, more depressed patients showed increased sympathetic tone at baseline and blunted response to impending anesthesia on the HRV measurements."

Our news journalists report that additional information may be obtained by contacting M.H. Kim, Sungkyunkwan UniversitySch Med, Samsung Med Center, Dept. of Anesthesiol & Pain Med, Seoul 06351, South Korea. Additional authors for this research include J.H. Park, S.M. Lee, M.S. Gwak, G.S. Kim and M.H. Kim.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jclinane.2016.09.012. This DOI is a link to an online electronic document that is either free or for purchase.

**Kidney Diseases and Conditions - Chronic Kidney...**

**Study Data from Taipei Medical University Hospital Update Understanding of Chronic Kidney Disease (Risk of liver injury after a-glucosidase inhibitor therapy in advanced chronic kidney disease patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Kidney Diseases and Conditions - Chronic Kidney Disease have been published. According to news reporting originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "Although a-glucosidase inhibitors (AGIs) are commonly used for controlling postprandial blood glucose, AGIs-induced liver injuries have been reported. However, the relationship between AGIs and liver injuries in advanced chronic kidney disease (CKD) patients remains unexplored."

Our news editors obtained a quote from the research from Taipei Medical University Hospital, "In this nationwide case-control study, we recruited 1765 advanced diabetic CKD patients, who received AGIs therapy from January 1, 2000 to December 31, 2010 as the study sample and 5295 matched controls. Recent and former AGIs users were defined as patients who
received the AGIs prescription for 30-60 d and 30-210 d before the event of liver injury. The risk of AGIs-induced liver injury was examined using time-dependent Cox proportional hazards model. Liver injury occurred in 3.9% of patients in the study group and 3.3% of patients in the control group. AGIs use did not increase the risk of liver injury in advanced CKD patients (p=0.19). The stratified analysis indicated no increased risk of liver injury in all AGIs-using subgroups (all p>0.05). The available evidence supports extending the use of AGIs without increasing the risk of liver injury in patients with advanced CKD."

According to the news editors, the research concluded: "Additional randomized controlled trials are warranted to confirm our results."

For more information on this research see: Risk of liver injury after a-glucosidase inhibitor therapy in advanced chronic kidney disease patients. Scientific Reports, 2016;6 ():18996. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Autoimmune Diseases and Conditions - Multiple...

Study Data from Tarbiat Modares University Update Understanding of Multiple Sclerosis (Association study of two functional single nucleotide polymorphisms of neuropeptide y gene with multiple sclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Autoimmune Diseases and Conditions - Multiple Sclerosis is now available. According to news reporting out of Tehran, Iran, by NewsRx editors, research stated, "Multiple sclerosis (MS) is an autoimmune disease of the central nervous system characterized by brain inflammation, demyelination and axonal loss. Neuropeptide Y (NPY) has a critical role in the maintenance of homeostasis in the immune system and coping of stress condition."

Financial supporters for this research include Iran National Science Foundation, Department of Research Affairs of Tarbiat Modares University.

Our news journalists obtained a quote from the research from Tarbiat Modares University, "In the current study we analyzed 188 patients suffering from MS and 204 unrelated healthy controls for two functional single nucleotide polymorphisms (SNPs), NPY 20T > C (rs16139) and NPY -485 T> C (rs16147) using PCR-RFLP and Mismatch PCR-RFLP methods. Our results demonstrated that homozygocity in the minor allele for NPY -485 T> C
polymorphism is associated with the MS risk in patients in compare with healthy controls (CC vs. TT, P = 0.033; CC vs. TT + TC, P = 0.02). In addition, by comparison with allele T, the frequency of NPY -485C allele was higher in cases than in control subjects and present increased risk of MS, but statistically significant was borderline (P = 0.053). The stratification for disease progression revealed a significant difference in the allelic and genotypic distribution between subgroups of MS and controls. The frequency of the CC genotype and C allele was higher in the primary progressive MS patients when compared with control group (CC vs. TT, P = 0.019; CC vs. TT + TC, P = 0.008; C vs. T, P = 0.022). In addition, the frequency of CC genotype was higher in the relapsing remitting MS patients when compared with control group (CC vs. TT, P = 0.034; CC vs. TT + TC, P = 0.016). Haplotype analysis demonstrated that the haplotype 3 (CT) is more common in RR MS (P = 0.041), and PP MS (P = 0.031) than control group."

According to the news editors, the research concluded: "The obtained results demonstrate the probable role of NPY SNPs in susceptibility to MS within the Iranian population."

Our news journalists report that additional information may be obtained by contacting M. Behmanesh, Tarbiat Modares Univ, Fac Biol Sci, Dept. of Genet, Tehran, Iran. Additional authors for this research include Z.S. Farsani, R. Dosti, M.A. Sahraian and M. Behmanesh.

Gram-Negative Bacteria - Salmonella

Study Data from Trinity College Update Knowledge of Salmonella (Re-engineering cellular physiology by rewiring high-level global regulatory genes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Negative Bacteria - Salmonella are presented in a new report. According to news reporting from Dublin, Ireland, by NewsRx journalists, research stated, "Knowledge of global regulatory networks has been exploited to rewire the gene control programmes of the model bacterium Salmonella enterica serovar Typhimurium. The product is an organism with competitive fitness that is superior to that of the wild type but tuneable under
specific growth conditions."

The news correspondents obtained a quote from the research from Trinity College, "The paralogous hns and stpA global regulatory genes are located in distinct regions of the chromosome and control hundreds of target genes, many of which contribute to stress resistance. The locations of the hns and stpA open reading frames were exchanged reciprocally, each acquiring the transcription control signals of the other. The new strain had none of the compensatory mutations normally associated with alterations to hns expression in Salmonella; instead it displayed rescheduled expression of the stress and stationary phase sigma factor RpoS and its regulon."

According to the news reporters, the research concluded: "Thus the expression patterns of global regulators can be adjusted artificially to manipulate microbial physiology, creating a new and resilient organism."

For more information on this research see: Re-engineering cellular physiology by rewiring high-level global regulatory genes. Scientific Reports, 2015;5():17653. (Nature Publishing Group - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting S. Fitzgerald, Dept. of Microbiology, Moyne Institute of Preventive Medicine, Trinity College Dublin, Dublin 2, Ireland. Additional authors for this research include S.C. Dillon, T.C. Chao, H.L. Wiencko, K. Hokamp, A.D. Cameron and C.J Dorman.

Intercellular Signaling Peptides and Proteins...

Study Data from Tzu Chi University Provide New Insights into Cytokines (Slow infusion rate of doxorubicin induces higher pro-inflammatory cytokine production)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Intercellular Signaling Peptides and Proteins - Cytokines. According to news reporting originating in Hualien, Taiwan, by NewsRx journalists, research stated, "Different infusion rates of doxorubicin (DOX) have been used for treating human malignancies. Organ toxicity after DOX infusion is a major issue in treatment disruption."

Financial supporters for this research include National Science Counsel, Tzu Chi University, Taipei Tzu Chi Hospital, Buddhist Tzu Chi Medical Foundation.

The news reporters obtained a quote from the research from Tzu Chi University, "However, whether different DOX infusion rates induce different toxicity is still unknown. In this study, we examined the toxicity effects of different DOX infusion rates in the early phase of organ toxicity. Thirty-six rats were randomly divided into 5-, 15-, and 30-min infusion rate groups. A single dose of DOX (8.3 mg/kg, I.V.) was administered at different infusion rates.
Blood samples were collected from the femoral artery at 1, 3, 6, 9, 12, 18, 24, 36, and 48 h after DOX administration. The blood cell count and blood biochemistry were analyzed. The liver, kidney, and heart were removed for pathological examinations after the rats were sacrificed. Our findings show that the 30-min group had higher injury markers in the liver (glutamic oxaloacetic transaminase and glutamic pyruvic transaminase), kidneys (blood urea nitrogen and creatinine), and heart (creatine phosphokinase-MB and lactate dehydrogenase), and had higher tumor necrosis factor-alpha and interleukin 6 levels than did the other groups. The 30-min group also had more severe damage according to the pathological examinations.

According to the news reporters, the research concluded: "Slower infusion of DOX induced a higher inflammatory response and greater organ damage."

For more information on this research see: Slow infusion rate of doxorubicin induces higher pro-inflammatory cytokine production. Regulatory Toxicology and Pharmacology, 2016;81():69-76. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Regulatory Toxicology and Pharmacology - www.journals.elsevier.com/regulatory-toxicology-and-pharmacology/)

Our news correspondents report that additional information may be obtained by contacting R.P. Lee, Tzu Chi Univ, Inst Med Sci, Hualien 97004, Taiwan. Additional authors for this research include Y.C. Peng, F.L. Yang, Y.M. Subeq and R.P. Lee.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.yrtph.2016.08.002. This DOI is a link to an online electronic document that is either free or for purchase.

Digestive System Diseases and Conditions - Crohn's... Study Data from University College Provide New Insights into Crohn's Disease (Genetic Complexity of Crohn's Disease in Two Large Ashkenazi Jewish Families)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Digestive System Diseases and Conditions - Crohn's Disease have been published. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "Crohn's disease (CD) is a highly heritable disease that is particularly common in the Ashkenazi Jewish population. We studied 2 large Ashkenazi Jewish families with a high prevalence of CD in an attempt to identify novel genetic risk variants."

Our news editors obtained a quote from the research from University College, "Ashkenazi Jewish patients with CD and a positive family history were recruited from the University College London Hospital. We used genome-wide, single-nucleotide polymorphism data to assess the burden of common CD-associated risk variants and for linkage analysis. Exome sequencing was performed and rare variants that were predicted to be deleterious and were observed at a high frequency in cases were prioritized. We undertook within-family
association analysis after imputation and assessed candidate variants for evidence of association with CD in an independent cohort of Ashkenazi Jewish individuals. We examined the effects of a variant in DUOX2 on hydrogen peroxide production in HEK293 cells. We identified 2 families (1 with >800 members and 1 with > 200 members) containing 54 and 26 cases of CD or colitis, respectively. Both families had a significant enrichment of previously described common CD-associated risk variants. No genome-wide significant linkage was observed. Exome sequencing identified candidate variants, including a missense mutation in DUOX2 that impaired its function and a frameshift mutation in CSF2RB that was associated with CD in an independent cohort of Ashkenazi Jewish individuals. In a study of 2 large Ashkenazi Jewish with multiple cases of CD, we found the genetic basis of the disease to be complex, with a role for common and rare genetic variants. We identified a frameshift mutation in CSF2RB that was replicated in an independent cohort."

According to the news editors, the research concluded: "These findings show the value of family studies and the importance of the innate immune system in the pathogenesis of CD."

The news editors report that additional information may be obtained by contacting A.W. Segal, UCL, Div Med, London WC1E 6JF, United Kingdom. Additional authors for this research include N. Pontikos, E.R. Schiff, L. Jostins, D. Speed, L.B. Lovat, J.C. Barrett, H. Grasberger, V. Plagnol and A.W. Segal.

Keywords for this news article include: London, United Kingdom, Europe, Digestive System Diseases and Conditions, Risk and Prevention, Inflammatory Bowel Diseases and Conditions, Gastrointestinal Diseases and Conditions, Gastroenterology, Crohn's Disease, Gastroenteritis, Genetics, University College.

**Oncology**

**Study Data from University College Update Knowledge of Oncology (ALK Immunohistochemistry in NSCLC: Discordant Staining Can Impact Patient Treatment Regimen)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology are presented in a new report. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Diagnostic immunohistochemistry (IHC) is increasingly accepted as a screening method for anaplastic lymphoma receptor tyrosine kinase gene (ALK) rearrangements in NSCLC. We have sought to establish an ongoing robust external quality assessment process to gauge quality of anaplastic lymphoma kinase (ALK) IHC, which can have an impact on interpretation of patient samples."

Our news journalists obtained a quote from the research from University College, "Unstained tissue and cell line samples were distributed on a quarterly basis to participating laboratories from 30 countries. Participants stained the slide using their routine diagnostic ALK
IHC method and returned the slide along with their in-house control and methodology details. Slides were assessed by a team of pathologists and scientists. Overall, there was a mean pass rate of 83% (range 71%-98%), with 38 variations in staining protocol. Methods included the following: the Roche D5F3 assay (65% of users, pass rate 93%); Novocastra 5A4 (15% of users, pass rate 65%); Cell Signaling Technology D5F3 (7% of users, pass rate 91%), and Dako ALK1 (5% of users, pass rate 50%). Choice of methodology directly affected final interpretation of distributed ALK-positive and ALK-negative NSCLC cases, which were correctly identified by 89% and 88% of participants, respectively. Antibody detection method was a contributing factor in false-negative staining results. The choice of laboratory controls was found to be unsuitable, and as such, in-house control recommendations are also provided. ALK IHC is a robust screening technique, but there is concern that some diagnostic laboratories are using inadequate staining methods, which has a direct impact on final interpretation."

According to the news editors, the research concluded: "External assessment helps provide laboratories with continued confidence in their ALK IHC testing."

neuroprotective effects against the amyloid cascade. It diminishes, for instance, the production of Ab peptides and their oligomerisation. In the present work we investigated the possible implication of RA receptor (RAR) in repair of Ab-induced DSBs. We demonstrated that RA, as well as RAR agonist Am80, but not AGN 193109 antagonist, repair Ab-induced DSBs in SH-SY5Y cells and an astrocytic cell line as well as in the murine cortical tissue of young and aged mice. The nonhomologous end joining pathway and the Ataxia Telangiectasia Mutated kinase were shown to be involved in RA-mediated DSBs repair in the SH-SY5Y cells. Our data suggest that RA, besides increasing cell viability in the cortex of young and even of aged mice, might also result in targeted DNA repair of genes important for cell or synaptic maintenance."

According to the news reporters, the research concluded: "This phenomenon would remain functional up to a point when Ab increase and RA decrease probably lead to a pathological state."

For more information on this research see: The Vitamin A Derivative All-Trans Retinoic Acid Repairs Amyloid-b-Induced Double-Strand Breaks in Neural Cells and in the Murine Neocortex. *Neural Plasticity*, 2016;2016():3707406. **Gram-Negative Bacteria - Escherichia coli**

**Study Data from University of Agriculture Provide New Insights into Escherichia coli [Emergence of NDM-5-and MCR-1-Producing Escherichia coli Clones ST648 and ST156 from a Single Muscovy Duck (Cairina moschata)]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Negative Bacteria - Escherichia coli is now available. According to news originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Two Escherichia coli clones (sequence type 648 [ST648] and ST156) that coproduce NDM-5 and MCR-1 were detected from a single fowl in China."

Our news journalists obtained a quote from the research from the University of Agriculture, "The bla(NDM-5) gene was found on the two indistinguishable IncX3 plasmids from the two different E. coli isolates, whereas the mcr-1 gene was located on IncHI2 and IncI2 plasmids, respectively, suggesting that bla(NDM-5) and mcr-1 have spread in avian intestinal
flora."

According to the news editors, the research concluded: "Also, the two strains harbor bla(TEM-1), bla(CTX-M-55,), fosA3, and aac(6')-Ib. The multiresistant E. coli strains (especially the epidemic clone ST648) might raise a potential threat to human health via food chain transmission."

For more information on this research see: Emergence of NDM-5-and MCR-1-Producing Escherichia coli Clones ST648 and ST156 from a Single Muscovy Duck (Cairina moschata). Antimicrobial Agents and Chemotherapy, 2016;60(11):6899-6902. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Heart Disorders and Diseases - Acute Coronary...

Study Data from University of Amsterdam Update Understanding of Acute Coronary Syndrome (Invasive strategies and outcomes for non-ST segment elevation acute coronary syndromes: a twelve-year experience from SWEDHEART)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Acute Coronary Syndrome. According to news originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "Despite recommendations in recent guidelines for a routine invasive strategy for non-ST-segment elevation acute coronary syndrome (NSTE-ACS), long-term data on the implementation of treatment strategies in clinical practice are not available. Our aim was to provide long-term data on the implementation of a routine invasive strategy in NSTE-ACS in clinical practice."

Our news journalists obtained a quote from the research from the University of Amsterdam, "In the SWEDHEART registry, data from 204,092 consecutive NSTE-ACS patients admitted between 1996 and 2007 were recorded. The use of the routine invasive strategy, retrospectively defined as coronary angiography (and subsequent revascularisation) within three days after admission, increased from 3.8% in the period 1996-1998 to 37.4% in the period 2005-2007. The largest absolute increase in the use of this strategy was observed in low-risk patients, while a similar relative increase was observed in all risk categories. The use of the selective invasive strategy, defined as coronary angiography later than three days after admission or none at all, decreased from 96.2% in the period 1996-1998 to 62.5% in the period 2005-2007. In the total population, there was a gradual decrease in three-year all-cause mortality, from
29.1% in the period 1996-1998 to 23.9% in the period 2005-2007. There has been an increase in the use of a routine invasive strategy in NSTE-ACS patients over the course of 12 years in Sweden."

According to the news editors, the research concluded: "There was a decrease in three-year mortality over the same time course."

The news correspondents report that additional information may be obtained from P. Damman, University of Amsterdam, Academy Med Center, Dept. of Cardiol, Amsterdam, Netherlands. Additional authors for this research include T. Jernberg, B. Lindahl, R.J. de Winter, A. Jeppsson, P. Johanson, C. Held and S.K. James.

**Immune System Diseases and Conditions - HIV/AIDS**

**Study Data from University of Amsterdam Update Understanding of HIV/AIDS (CRISPR-Cas9 Can Inhibit HIV-1 Replication but NHEJ Repair Facilitates Virus Escape)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Immune System Diseases and Conditions - HIV/AIDS. According to news reporting out of Amsterdam, Netherlands, by NewsRx editors, research stated, "Several recent studies demonstrated that the clustered regularly interspaced short palindromic repeats (CRISPR)-associated endonuclease Cas9 can be used for guide RNA (gRNA)-directed, sequence-specific cleavage of HIV proviral DNA in infected cells. We here demonstrate profound inhibition of HIV-1 replication by harnessing T cells with Cas9 and antiviral gRNAs."

Our news journalists obtained a quote from the research from the University of Amsterdam, "However, the virus rapidly and consistently escaped from this inhibition. Sequencing of the HIV-1 escape variants revealed nucleotide insertions, deletions, and substitutions around the Cas9/gRNA cleavage site that are typical for DNA repair by the nonhomologous end-joining pathway."

According to the news editors, the research concluded: "We thus demonstrate the potency of CRISPR-Cas9 as an antiviral approach, but any therapeutic strategy should consider the viral escape implications."

For more information on this research see: CRISPR-Cas9 Can Inhibit HIV-1 Replication but NHEJ Repair Facilitates Virus Escape. *Molecular Therapy*, 2016;24(3):522-6. (Elsevier - www.elsevier.com; Molecular Therapy - www.journals.elsevier.com/molecular-therapy/)

Health and Medicine - Medicinal Chemistry

Study Data from University of Bayreuth Update Knowledge of Medicinal Chemistry (Halogenated naphthochalcones and structurally related naphthopyrazolines with antitumor activity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Medicinal Chemistry have been published. According to news originating from Bayreuth, Germany, by NewsRx correspondents, research stated, "Three 3-(3-halo-4,5-dimethoxyphenyl)-1-(2-naphthyl)prop-2-en-1-ones 1 and three structurally related 2-pyrazolines 2 were prepared and assessed in vitro for anticancer activity."

Our news journalists obtained a quote from the research from the University of Bayreuth, "The chalcones 1 were antiproliferative with low double-digit micromolar IC50 values against six tumor cell lines whereas the pyrazolines 2 showed low single-digit micromolar IC50) values against this panel. The pyrazolines inhibited ATP binding cassette efflux transporters of types P-gp and BCRP while the chalcones inhibited selectively BCRP."

According to the news editors, the research concluded: "All test compounds induced an accumulation of HT-29 colon carcinoma cells in the G2/M phase of the cell cycle and they interfered with the microtubule and F-actin dynamics, but only the chalcones induced apoptosis in 518A2 melanoma cells after 24 h."

The news correspondents report that additional information may be obtained from R. Schobert, University of Bayreuth, Organ Chem Lab, D-95440 Bayreuth, Germany. Additional authors for this research include H. Draut, B. Biersack and R. Schobert.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.bmcl.2016.09.076. This DOI is a link to an online electronic document that is either free or for purchase.

Study Data from University of Bergen Provide New Insights into Acute Myeloid Leukemia (The Complexity of Targeting PI3K-Akt-mTOR Signalling in Human Acute Myeloid Leukaemia: The Importance of Leukemic Cell Heterogeneity, Neighbouring ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Acute Myeloid Leukemia have been presented. According to news originating from Bergen, Norway, by NewsRx correspondents, research stated, "Therapeutic targeting of PI3K-Akt-mTOR is considered a possible strategy in human acute myeloid leukaemia (AML); the most important rationale being the proapoptotic and antiproliferative effects of direct PI3K/mTOR inhibition observed in experimental studies of human AML cells. However, AML is a heterogeneous disease and these effects caused by direct pathway inhibition in the leukemic cells are observed only for a subset of patients."

Our news journalists obtained a quote from the research from the University of Bergen, "Furthermore, the final effect of PI3K-Akt-mTOR inhibition is modulated by indirect effects, i.e., treatment effects on AML-supporting non-leukemic bone marrow cells. In this article we focus on the effects of this treatment on mesenchymal stem cells (MSCs) and monocytes/macrophages; both these cell types are parts of the haematopoietic stem cell niches in the bone marrow. MSCs have unique membrane molecule and constitutive cytokine release profiles, and mediate their support through bidirectional crosstalk involving both cell-cell contact and the local cytokine network. It is not known how various forms of PI3K-Akt-mTOR targeting alter the molecular mechanisms of this crosstalk. The effect on monocytes/macrophages is also difficult to predict and depends on the targeted molecule."

According to the news editors, the research concluded: "Thus, further development of PI3K-Akt-mTOR targeting into a clinical strategy requires detailed molecular studies in well-characterized experimental models combined with careful clinical studies, to identify patient subsets that are likely to respond to this treatment."

For more information on this research see: The Complexity of Targeting PI3K-Akt-mTOR Signalling in Human Acute Myeloid Leukaemia: The Importance of Leukemic Cell Heterogeneity, Neighbouring Mesenchymal Stem Cells and Immunocompetent Cells, *Molecules*, 2016;21(11):1365-1396. *Molecules* can be contacted at: Mdpì Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. (Springer - www.springer.com; Molecules - www.springerlink.com/content/1420-3049/)

Coronaviridae Infections - Coronavirus Infections

Study Data from University of Bonn Update Understanding of Coronavirus Infections (Viral Shedding and Antibody Response in 37 Patients With Middle East Respiratory Syndrome Coronavirus Infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Coronaviridae Infections - Coronavirus Infections have been published. According to news reporting originating from Bonn, Germany, by NewsRx correspondents, research stated, "The Middle East respiratory syndrome (MERS) coronavirus causes isolated cases and outbreaks of severe respiratory disease. Essential features of the natural history of disease are poorly understood."

Our news editors obtained a quote from the research from the University of Bonn, "We studied 37 adult patients infected with MERS coronavirus for viral load in the lower and upper respiratory tracts (LRT and URT, respectively), blood, stool, and urine. Antibodies and serum neutralizing activities were determined over the course of disease. One hundred ninety-nine LRT samples collected during the 3 weeks following diagnosis yielded virus RNA in 93% of tests. Average (maximum) viral loads were 5 ? 10(6) (6 ? 10(10)) copies/mL. Viral loads (positive detection frequencies) in 84 URT samples were 1.9 ? 10(4) copies/mL (47.6%). Thirty-three percent of all 108 serum samples tested yielded viral RNA. Only 14.6% of stool and 2.4% of urine samples yielded viral RNA. All seroconversions occurred during the first 2 weeks after diagnosis, which corresponds to the second and third week after symptom onset. Immunoglobulin M detection provided no advantage in sensitivity over immunoglobulin G (IgG) detection. All surviving patients, but only slightly more than half of all fatal cases, produced IgG and neutralizing antibodies. The levels of IgG and neutralizing antibodies were weakly and inversely correlated with LRT viral loads. Presence of antibodies did not lead to the elimination of virus from LRT. The timing and intensity of respiratory viral shedding in patients with MERS closely matches that of those with severe acute respiratory syndrome. Blood viral RNA does not seem to be infectious. Extrapulmonary loci of virus replication seem possible."

According to the news editors, the research concluded: "Neutralizing antibodies do not suffice to clear the infection."

For more information on this research see: Viral Shedding and Antibody Response in 37 Patients With Middle East Respiratory Syndrome Coronavirus Infection. Clinical Infectious Diseases, 2015;62(4):477-83. (Oxford University Press - www.oup.com; Clinical Infectious Diseases - cid.oxfordjournals.org)

Study Data from University of California Provide New Insights into Thrombocytopenic Purpura (Thrombotic thrombocytopenic purpura in a postoperative patient taking cephalexin responding to plasmapheresis: A case report and review of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hematologic Diseases and Conditions - Thrombocytopenic Purpura are discussed in a new report. According to news reporting from Irvine, California, by NewsRx journalists, research stated, "The clinical presentation of thrombotic thrombocytopenic purpura (TTP) is often atypical delaying diagnosis and treatment. A number of drugs have been implicated in the development of TTP, including cyclosporine, tacrolimus, clopidogrel, and quinine."

The news correspondents obtained a quote from the research from the University of California, "To our knowledge, only three cases of cephalosporin-induced TTP have been described, with two of these cases occurring with these use of cephalexin. We herein describe a case of TTP occurring in a postoperative patient taking cephalexin, requiring plasmapheresis."

According to the news reporters, the research concluded: "Following plasmapheresis, the patient's mental status and platelet count significantly improved. J. Clin. Apheresis 31:473-475, 2016."

Our news journalists report that additional information may be obtained by contacting K.T. Amber, University of California, Dept. of Dermatol, Center Hlth, Irvine, CA 92717, United States.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Physics - Biophysics. According to news reporting from Cambridge, United Kingdom, by NewsRx journalists, research stated, "The conversion of human lysozyme into amyloid fibrils is associated with a rare but fatal hereditary form of non-neuropathic systemic amyloidosis. The accumulation of large amounts of aggregated protein is thought to be initiated by the formation of transient intermediate species of disease-related lysozyme variants, essentially due to the loss of global cooperativity under physiologically relevant conditions."

Funders for this research include Biotechnology and Biological Sciences Research Council, Medical Research Council, Belgian Program of Interuniversity Attraction Poles, Federal Office for Scientific Technical and Cultural Affairs, European Union’s Sixth Framework Program, Wellcome Trust, Leverhulme Trust, Korean Government Scholarship for Overseas Studies, Boehringer Ingleheim, EPSRC Core Capability.

The news correspondents obtained a quote from the research from the University of Cambridge, "Interestingly, all five naturally occurring, amyloidogenic, single-point mutations are located in the α-domain of lysozyme, the region that is predominantly unfolded during the formation of the transient intermediate species. Given the lack of known naturally occurring, amyloidogenic, single-point mutations in the α-domain, we chose three specific mutations to address the effects that location may have on native-state dynamics, as studied by hydrogen-deuterium (HD) exchange experiments analyzed by NMR spectroscopy, and mass spectrometry. We compared the effect of a destabilizing α-domain mutation (I23A) with that of the well-characterized 159T β-domain variant. We also investigated the effect of a mutation that has minor effects on native-state stability at the domain interface (I56V) and compared it with that of a variant with similar stability within the C-helix (189V). We show that when variants have similar reduced native-state stabilities, the location of the mutation (I23A versus I59T) is crucial to the native-state dynamics, with the a-domain mutation having a significantly lower ability to populate transient intermediate species under physiologically relevant conditions. Interestingly, the mutation at the interface (I56V) has a greater effect in facilitating the formation of transient intermediate species at elevated temperatures compared with the variants containing a-domain mutations, even though this mutation results in only minor changes to the native-state stability of lysozyme."

According to the news reporters, the research concluded: "These findings reveal that the location of specific mutations is an important factor in determining the native-state dynamical properties of human lysozyme in the context of its propensity to populate the aggregation prone transient intermediate species associated with pathogenic amyloid formation."

For more information on this research see: The Significance of the Location of Mutations for the Native-State Dynamics of Human Lysozyme. Biophysical Journal, 2016;111 (11):2358-2367. Transplant Medicine - Cell Transplants

Study Data from University of Chicago Update Understanding of Cell Transplants (Identification of high-risk amino-acid substitutions in hematopoietic cell transplantation: a challenging task)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Transplant Medicine - Cell Transplants have been presented. According to news reporting out of Chicago, Illinois, by NewsRx editors, research stated, "Allogeneic hematopoietic cell transplantation (HCT) offers the potential to cure hematologic malignancies. In the absence of an HLA-matched donor, HLA mismatched unrelated donors may be used, although risks of GvHD and treatment-related mortality (TRM) are higher."

Our news journalists obtained a quote from the research from the University of Chicago, "Identification and avoidance of amino-acid substitution and position types (AASPT) conferring higher risks of TRM and GvHD would potentially improve the success of transplantation from single HLA mismatched unrelated donors. Using random forest and logistic regression analyses, we identified 19 AASPT associated with greater risks for at least one adverse transplant outcome: grade III-IV acute GvHD, TRM, lower disease-free survival or worse overall survival relative to HLA-matched unrelated donors and to other AASPT. When tested in an independent validation cohort of 3530 patients, none of the AASPT from the training set were validated as high risk, however. Review of the literature shows that failure to validate original observations is the rule and not the exception in immunobiology and emphasizes the importance of independent validation before clinical application. Our current data do not support avoiding any specific class I AASPT for unrelated donors."

According to the news editors, the research concluded: "Additional studies should be performed to fully understand the role of AASPT in HCT outcomes."

For more information on this research see: Identification of high-risk amino-acid substitutions in hematopoietic cell transplantation: a challenging task. Bone Marrow Transplantation, 2016;51(10):1342-1349. Bone Marrow Transplantation can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. DNA Research

Study Data from University of Dundee Provide New Insights into DNA Research (Olaparib, Monotherapy or with Ionizing Radiation, Exacerbates DNA Damage in Normal Tissues: Insights from a New p21 Reporter Mouse)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on DNA Research have been published. According to news reporting originating in Dundee, United Kingdom, by NewsRx journalists, research stated, "Many drugs targeting the DNA damage response are being developed as anticancer therapies, either as single agents or in combination with ionizing radiation (IR) or other cytotoxic agents. Numerous clinical trials in this area are either in progress or planned."

The news reporters obtained a quote from the research from the University of Dundee, "However, concerns remain about the potential of such treatments to increase toxicity to normal tissues. In order to address this issue, a novel reporter mouse line was created through the simultaneous incorporation of multiple reporters, beta-galactosidase, and firefly luciferase, into the DNA damage-inducible p21 (CDKN1A) locus. The data demonstrate that in situ b-galactosidase staining facilitates high fidelity mapping of p21 expression across multiple organs and tissues at single-cell resolution, whereas the luciferase reporter permits noninvasive bioluminescent imaging of p21 expression. This model was used to determine the capacity of a number of DNA-damaging agents, including IR, cisplatin, and etoposide to induce p21 expression in normal tissues. In addition, the PARP inhibitor olaparib was examined alone or in combination with IR as well as cisplatin. A single exposure to olaparib alone caused DNA damage to cells in the mucosal layer lining mouse large intestine. It also exacerbated DNA damage induced in this organ and the kidney by coadministered IR."

According to the news reporters, the research concluded: "These studies suggest that olaparib has carcinogenic potential and illustrate the power of this new model to evaluate the safety of new therapeutic regimens involving combination therapies."

For more information on this research see: Olaparib, Monotherapy or with Ionizing Radiation, Exacerbates DNA Damage in Normal Tissues: Insights from a New p21 Reporter Mouse. Molecular Cancer Research, 2016;14(12):1195-1203. Molecular Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Neurodegenerative Diseases and Conditions - ...

Study Data from University of Edinburgh Update Understanding of Alzheimer Disease (METACOHORTS for the study of vascular disease and its contribution to cognitive decline and neurodegeneration: An initiative of the Joint Programme for ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Neurodegenerative Diseases and Conditions - Alzheimer Disease are discussed in a new report. According to news reporting originating from Midlothian, United Kingdom, by NewsRx correspondents, research stated, "Dementia is a global problem and major target for health care providers. Although up to 45% of cases are primarily or partly due to cerebrovascular disease, little is known of these mechanisms or treatments because most dementia research still focuses on pure Alzheimer's disease."

Funders for this research include Joint Programme for Neurodegenerative Disease, UK Medical Research Council, Deutsches Zentrum fur Neurodegenerative Erkrankungen, Canadian Institutes of Health Research, Scottish Funding Council, NIH.

Our news editors obtained a quote from the research from the University of Edinburgh, "An improved understanding of the vascular contributions to neurodegeneration and dementia, particularly by small vessel disease, is hampered by imprecise data, including the incidence and prevalence of symptomatic and clinically 'silent' cerebrovascular disease, long-term outcomes (cognitive, stroke, or functional), and risk factors. New large collaborative studies with long follow-up are expensive and time consuming, yet substantial data to advance the field are available. In an initiative funded by the Joint Programme for Neurodegenerative Disease Research, 55 international experts surveyed and assessed available data, starting with European cohorts, to promote data sharing to advance understanding of how vascular disease affects brain structure and function, optimize methods for cerebrovascular disease in neurodegeneration research, and focus future research on gaps in knowledge. Here, we summarize the results and recommendations from this initiative. We identified data from over 90 studies, including over 660,000 participants, many being additional to neurodegeneration data initiatives. The enthusiastic response means that cohorts from North America, Australasia, and the Asia Pacific Region are included, creating a truly global, collaborative, data sharing platform, linked to major national dementia initiatives."

According to the news editors, the research concluded: "Furthermore, the revised World Health Organization International Classification of Diseases version 11 should facilitate recognition of vascular-related brain damage by creating one category for all cerebrovascular disease presentations and thus accelerate identification of targets for dementia prevention."

For more information on this research see: METACOHORTS for the study of

**Cardiovascular Diseases and Conditions -...**

**Study Data from University of Florida Provide New Insights into Arteriovenous Fistula (Onyx extrusion through the scalp after embolization of dural arteriovenous fistula)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Arteriovenous Fistula. According to news reporting out of Gainesville, Florida, by NewsRx editors, research stated, "A man in his sixties referred with symptoms of episodic left lip numbness and left arm weakness was diagnosed with a Borden type 3 dural arteriovenous fistula (DAVF) on DSA. Successful Onyx embolization of the DAVF was performed via the distal left occipital artery using an ev3 Apollo detachable tip microcatheter."

Our news journalists obtained a quote from the research from the University of Florida, "He underwent surgical obliteration for the residual DAVF 3 days later. Three months later during a routine postoperative clinic visit, the patient produced a plastic bag containing multiple small pieces of Onyx cast and the detached tip of the Apollo microcatheter that had extruded out from his scalp through small spontaneous holes about 5 weeks after the embolization procedure."

According to the news editors, the research concluded: "This spontaneous extrusion of Onyx can be alarming to the patient not expecting it; however, prior knowledge and discussion can lessen the anxiety of both the treating physician and the patient dealing with such a situation."

For more information on this research see: Onyx extrusion through the scalp after embolization of dural arteriovenous fistula. *Journal of Neurointerventional Surgery*, 2016;8 (9):19-21. *Journal of Neurointerventional Surgery* can be contacted at: Bmj Publishing Group,
Study Data from University of Gothenburg Provide New Insights into Cardiomyopathies (Experiences of health care in women with Peripartum Cardiomyopathy in Sweden: a qualitative interview study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Cardiomyopathies are discussed in a new report. According to news reporting from Gothenburg, Sweden, by NewsRx journalists, research stated, "Peripartum cardiomyopathy is often associated with severe heart failure occurring towards the end of pregnancy or in the months following birth with debilitating, exhausting and frightening symptoms requiring person-centered care. The aim of this study was to explore women's experiences of health care while being diagnosed with peripartum cardiomyopathy."

The news correspondents obtained a quote from the research from the University of Gothenburg, "Qualitative interviews were conducted with 19 women with peripartum cardiomyopathy in Sweden, following consent. Data were analysed using qualitative content analysis. Confirmability was ensured by peer-debriefing, and an audit trail was kept to establish the credibility of the study. The main theme in the experience of health care was, 'Exacerbated Suffering', expressed in three subthemes; 'not being cared about', 'not being cared for' and 'not feeling secure.' The suffering was present in relation to the illness with failing health symptoms, but most of all in relation to not being taken seriously and adequately cared for by healthcare professionals. Women felt they were on an assembly line in midwives' routine work where knowledge about peripartum cardiomyopathy was lacking and they showed distrust and dissatisfaction with care related to negligence and indifference experienced from healthcare professionals. Feelings of being alone and lost were prominent and related to a sense of insecurity, distress and uneasiness. This study shows a knowledge gap of peripartum cardiomyopathy in maternity care personnel. This is alarming as the deprecation of symptoms and missed diagnosis of peripartum cardiomyopathy can lead to life-threatening consequences."

According to the news reporters, the research concluded: "To prompt timely diagnosis and avoid unnecessary suffering it is important to listen seriously to, and respect, women's narratives and act on expressions of symptoms of peripartum cardiomyopathy, even those overlapping normal pregnancy symptoms."

For more information on this research see: Experiences of health care in women

Our news journalists report that additional information may be obtained by contacting H. Patel, University of Gothenburg, Sahlgrenska Academy, Inst Hlth & Care Sci, Gothenburg, Sweden. Additional authors for this research include M. Schaufelberger, C. Begley and M. Berg.

Heart Disorders and Diseases - Heart Attack

**Study Data from University of Gothenburg Update Understanding of Heart Attack (Women's help-seeking behaviour during a first acute myocardial infarction)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Attack have been published. According to news reporting out of Gothenburg, Sweden, by NewsRx editors, research stated, "Studies indicate that the time from onset of symptoms to medical treatment has decreased in acute myocardial infarction (AMI). However, there are still variations indicating that women wait longer than men before making the decision to seek medical care."

Financial supporters for this research include Vastra Gotalandsregionen, Alice Swensson and the Foundation for Cardiology in Gothenburg.

Our news journalists obtained a quote from the research from the University of Gothenburg, "Multidimensional factors hindering and facilitating the decision have been identified in previous studies, though few have fully explored how social context affects women's expectations, interpretations and actions and so influences the decision-making process. The aim of this study was therefore to identify how women's experiences interacted and influenced the decision to seek medical care at their first AMI. Seventeen women, aged 38-75 years, were interviewed, at home or in the hospital, between June 2011 and May 2012. Grounded theory was used as a method, and data collection and analysis were carried out simultaneously. The results showed that before deciding to seek medical care, these women went through three defined but interrelated processes that together hindered their normal activities and made them act according to existential needs. The women's experiences of the progression of the disease, in terms of both symptoms and time, were very different, so they sought medical care at different times, sometimes life-threateningly late and sometimes before developing an AMI. Three mechanisms had to coincide if the women were to receive medical care. First, the women had to acknowledge their symptoms as something more than common bodily changes. Second, the healthcare system had to be accessible when the women made their decision to seek care."

According to the news editors, the research concluded: "Third, the women must have
come into contact with healthcare providers when the heart muscle had taken enough damage to measure."

Our news journalists report that additional information may be obtained by contacting A. Gyberg, University of Gothenburg, Inst Hlth & Care Sci, Gothenburg, Sweden. Additional authors for this research include L. Bjorck, S. Nielsen, S. Maatta and K. Falk.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/scs.12286. This DOI is a link to an online electronic document that is either free or for purchase.

Endothelial Cells

Study Data from University of Hawaii Provide New Insights into Endothelial Cells (Anti-inflammatory activity of Barleria lupulina: Identification of active compounds that activate the Nrf2 cell defense pathway, organize cortical actin, reduce ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Endothelial Cells have been published. According to news originating from Hilo, Hawaii, by NewsRx correspondents, research stated, "Ethnopharmacological relevance: Hot aqueous extracts of the plant Barleria lupulina (BL) are used for treating inflammatory conditions and diabetic vascular complications. Aim of the Study: The goal was to identify active compounds in hot aqueous extracts of BL (HAE-BL) that are consistent with a role in reducing inflammation and reducing the vascular pathology associated with diabetes."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from the University of Hawaii, "In particular, we examined activation of the Nrf2 cell defense pathway because our initial findings indicated that HAE-BL activates Nrf2, and because Nrf2 is known to suppress inflammation. Activation of Nrf2 by HAE-BL has not been described previously. Human endothelial cells, real-time PCR, western blotting, cytoskeletal analyses, and assay-guided fractionation with HPLC were used to identify specific compounds in HAE-BL that activate the Nrf2 cell defense pathway and reduce markers of inflammation in vitro. HAE-BL potently activated the Nrf2 cell defense pathway in endothelial cells consistent with its traditional use and reported success in reducing inflammation. Assay guided fractionation with HPLC identified three alkyl catechols: 4-ethylcatechol, 4-vinylcatechol, and 4-methylcatechol, that are each potent Nrf2 activators. In addition to activating Nrf2, HAE-BL and alkyl catechols each profoundly improved organization of the endothelial cell actin cytoskeleton, reduced actin stress..."
fibers, organized cell cell junctions, and induced expression of mRNA encoding claudin-5 that is important for formation of endothelial tight junctions and reducing vascular leak. HAE-BL contains important alkyl catechols that potently activate the Nrf2 cell defense pathway, improve organization of the endothelial cell cytoskeleton, and organize tight cell junctions. All of these properties are consistent with a role in reducing inflammation and reducing vascular leak.

According to the news editors, the research concluded: "Because activation of the Nrf2 cell defense pathway also prevents cancers, neuro-degeneration, age related macular degeneration, and also reduces the severity of chronic obstructive pulmonary disorder and multiple sclerosis, HAE-BL warrants additional consideration for these other serious disorders."

The news correspondents report that additional information may be obtained from S.G. Cao, University of Hawaii, Dept. of Pharmaceut Sci, Daniel K Inouye Coll Pharm, Hilo, HI 96720, United States. Additional authors for this research include M.V. Hoang, K.H. Kim, C.S. Li and S.G. Cao.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jep.2016.09.017. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Head and Neck Cancer**

**Study Data from University of Illinois Update Knowledge of Head and Neck Cancer (Weekly versus every-three-weeks platinum-based chemoradiation regimens for head and neck cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Head and Neck Cancer. According to news reporting originating from Chicago, Illinois, by NewsRx correspondents, research stated, "The majority of chemoradiation (CRT) trials for locally advanced head and neck squamous cell carcinoma (HNSCC) have relied on platinum-based chemotherapy regimens administered every-3-weeks. However, given the increased utilization of weekly platinum regimens, it remains unclear how different chemotherapy schedules compare regarding efficacy and toxicity."

Our news editors obtained a quote from the research from the University of Illinois, "We retrospectively identified 212 patients with HNSCC who were treated at a single academic medical center with concurrent platinum-based CRT given weekly (N = 68) or every-three-weeks (N = 144). JMP version 10 (SAS Institute) was used for statistical analysis. Discrete variables were compared with the chi-square test and differences in the medians were assessed
using the Wilcoxon test. Survival curves were constructed using the Kaplan-Meier method and significance was assessed using the log rank test. For univariate analysis and multivariate analysis, we used Cox proportional hazard or logistic regression models to compare differences in survival or differences in categorical variables, respectively. Patients receiving weekly platinum regimens were more likely to be older (median age 61.4 vs. 55.5 y; P<.001), have high or very high Charlson comorbidity index (45.6% vs. 27.8%; P =.01), and receive carboplatin-based chemotherapy (6.3% vs. 76.5%; P<.001). Weekly and every-3-week platinum regimens had similar locoregional control (HR 1.10; 95% CI 0.63-1.88; P=.72), progression-free survival (HR 1.13; 95% CI 0.75-1.69; P=.55), and overall survival (HR 1.11; 95% CI 0.64-1.86; P=.71). Every-3-weeks platinum regimens were associated with increased days of hospitalization (median: 3 days vs. 0 days; P=.03) and acute kidney injury (AKI) during radiotherapy (50.0% vs. 22.1%; P<.001). On multivariate analysis, AKI was significantly associated with every-3-weeks regimens (OR: 24.38; 95% CI 3.00-198.03; P =.003) and high comorbidity scores (OR: 2.74; 95% CI 2.15-5.99; P =.01).

According to the news editors, the research concluded: "Our results suggest that every-3-weeks and weekly platinum-containing CRT regimens have similar disease control but weekly platinum regimens are associated with less acute toxicity."

The news editors report that additional information may be obtained by contacting M.T. Spiotto, University of Illinois, Dept. of Radiat Oncol, Chicago, IL 60607, United States. Additional authors for this research include B.T. Cooper, M. Koshy, J.S. Silverman and M.T. Spiotto.

**Oncology - Breast Cancer**

**Study Data from University of Iowa Update Knowledge of Breast Cancer (Effect of Body Mass Index- and Actual Weight-Based Neoadjuvant Chemotherapy Doses on Pathologic Complete Response in Operable Breast Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Breast Cancer is now available. According to news originating from Iowa City, Iowa, by NewsRx correspondents, research stated, "The effect of body mass index (BMI) on pathologic complete response (pCR) accounting for neoadjuvant chemotherapy (NAC) dose reductions remains undefined. In 171 patients with operable breast cancer who received NAC, those with a BMI of >= 25 were less likely to tolerate uncapped taxane doses."

Our news journalists obtained a quote from the research from the University of Iowa,
Any chemotherapy dose reduction resulted in greater odds of not attaining a pCR in obese patients, independent of known predictors. The effect of body mass index (BMI) and chemotherapy dose reduction on pathologic complete response (pCR) after neoadjuvant chemotherapy (NAC) for locoregional breast cancer remains unclear. Contemporary studies have reported largely on trial populations and used dose-capping. Patient registries at the University of Iowa were queried to identify patients with operable breast cancer who received NAC. Dose reductions were calculated for taxanes (T), anthracyclines (A) and non A-T chemotherapy. Clinical-pathologic characteristics, chemotherapy dose reductions, and adverse events were compared between normal (BMI <25) and overweight/obese patients (BMI >= 25). Additionally, the synergistic effect of BMI and chemotherapy dose reduction on pCR was assessed. Of 171 eligible patients, 112 were overweight/obese. Chemotherapy dosing was capped in 2 patients; all others initiated full weight-based treatment. Overweight/obese patients required more frequent taxane (44.6% vs. 25.4%; P =.01) and any chemotherapy dose reductions (50.9% vs. 33.9%; P =.03). pCR was attained in 29.2% of patients. In a multivariable model, the interaction term for BMI as a continuous variable and any chemotherapy dose reduction was significant independent of the clinical stage and tumor receptor status (P =.04). For obese patients, any chemotherapy dose reduction was significantly associated with increased odds of not attaining pCR. During NAC, overweight/obese patients more often have chemotherapy dose reductions. Chemotherapy dose reduction in obese patients was a powerful predictor of not attaining pCR. This was not seen for normal or overweight patients.

According to the news editors, the research concluded: "Opportunities might exist to improve pCR rates in this higher-risk group."

For more information on this research see: Effect of Body Mass Index- and Actual Weight-Based Neoadjuvant Chemotherapy Doses on Pathologic Complete Response in Operable Breast Cancer. Clinical Breast Cancer, 2016;16(6):480-486. Clinical Breast Cancer can be contacted at: Cig Media Group, Lp, 3500 Maple Avenue, Ste 750, Dallas, TX 75219-3931, USA. (Elsevier - www.elsevier.com; Clinical Breast Cancer - www.journals.elsevier.com/clinical-breast-cancer/)

The news correspondents report that additional information may be obtained from A. Thomas, University of Iowa, Dept. of Internal Med, Div Hematol Oncol & Blood & Marrow Transplantat, Iowa City, IA 52242, United States. Additional authors for this research include S.L. Mott, M.C. Schroeder, S. Phadke, J. El Masri and A. Thomas.

Drugs and Therapies - Antibiotics

Study Data from University of Libre de Bruxelles Provide New Insights into Antibiotics (Individualized antibiotic strategies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antibiotics are discussed in a new report. According to news originating from Brussels, Belgium, by NewsRx correspondents, research stated, "Infections are common complications in critically ill patients and are frequently
treated with antibiotics. Unfortunately, delivery of optimal therapy is complicated because efficacy of antimicrobials is influenced by the timing of treatment initiation, the use of combination therapy, and the optimization of drug dosing."

Our news journalists obtained a quote from the research from the University of Libre de Bruxelles, "Early diagnosis of infection is mandatory to provide a rapid and appropriate antibiotic therapy. The presence of less susceptible strains, in particular for hospital-acquired infections, or patients with severe disease, such as the presence of septic shock, may need combination antibiotic therapy. Antibiotic pharmacokinetics, notably volume of distribution and total body clearance, are significantly altered in these critically ill patients and can influence the attainment of adequate circulating levels when standard dosage regimens are administered. Higher dosing should be considered in such patients, although in case of renal impairment and reduced clearance, drug accumulation could also result in some side-effects. Nebulized antibiotics may provide a better clinical response than systemic antibiotics in ventilator-associated pneumonia because of multidrug-resistant pathogens. The optimal use of antibiotics in the management of severe infections is an important challenge for ICU physicians."

According to the news editors, the research concluded: "Antimicrobial therapy needs to be individualized according to specific patient characteristics, infecting organisms, and susceptibility patterns."

The news correspondents report that additional information may be obtained from F.S. Taccone, aDept. of Intensive Care bDept. of Infectious Diseases, Hopital Erasme, Universite Libre de Bruxelles (ULB), Brussels, Belgium. Additional authors for this research include O. Bond, F.Z. Cavicchi and M. Hites.

**Clinical Research - Clinical Trials and Studies**

**Study Data from University of Liverpool Update Understanding of Clinical Trials and Studies (Nitrous oxide-based versus nitrous oxide-free general anaesthesia and accidental awareness during general anaesthesia in surgical patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news originating from Liverpool, United Kingdom, by NewsRx correspondents, research stated, "Accidental awareness during general anaesthesia (AAGA) is when a patient unintentionally becomes conscious during a procedure performed with general anaesthesia and subsequently has explicit recall of this event. Incidence estimates for AAGA vary, with the most common estimate being one to two cases per 1000 general anaesthetics."

Our news journalists obtained a quote from the research from the University of Liverpool.
Liverpool, "Evidence linking nitrous oxide use and an increased risk of AAGA has come from observational studies data but the literature is contradictory, with some studies finding a protective effect of nitrous oxide. To assess the effect of general anaesthesia including nitrous oxide on the risk of AAGA in patients aged five years and over. Search methods We searched the following databases: Cochrane Central Register of Controlled Trials (CENTRAL), MEDLINE, EMBASE and trial registers (www.clinicaltrials.gov), the WHO International Clinical Trials Registry Platform (www.who.int/ictrp/network/en/) and Current Controlled Trials (www.isrctn.com/) for eligible studies on December 9 2015. In addition, we conducted forward and backward citation searching using key identified papers. Selection criteria We considered all randomized controlled trials (RCTs), including quasi-randomized studies and cluster-randomized studies, of participants aged five years or older receiving general anaesthesia for any type of surgery. We included trials in which participants receiving general anaesthesia that included nitrous oxide for maintenance at a concentration of at least 30% were compared with participants receiving no nitrous oxide during general anaesthesia. The intervention group must have received nitrous oxide in conjunction with an additional anaesthetic. We excluded studies where the depth of anaesthesia differed between the study arms. For inclusion in the review, studies needed to state in their methods that they planned to assess AAGA. We defined this as when a patient becomes conscious during a procedure performed with general anaesthesia and subsequently has explicit recall of this event. Data collection and analysis We used standard methodological procedures expected by Cochrane to identify studies. We extracted data and conducted 'Risk of bias' assessment using the Covidence database. We included 15 studies. The total number of participants included in the analyses was 3520. Most studies were small with fewer than 120 participants, although two larger studies with 2012 and 671 participants were included. There was considerable variation in many of the study characteristics, including the anaesthetics used. The concentrations of nitrous oxide varied between 50% and 70%, and half of the studies used clinical signs and haemodynamic changes to monitor depth of anaesthesia. As it was not possible to blind the anaesthetist to the anaesthetic used, we rated all studies at high risk of performance bias and we therefore downgraded the quality of evidence by one level for risk of bias using the GRADE approach. Other types of bias were generally low, or were rated unclear due to missing information. No studies were designed to measure AAGA as the primary outcome, and were therefore statistically underpowered to answer this review question. Despite the inclusion of 3520 participants, only three awareness events were reported by two studies. In one study the event was due to technical failure. Due to the rarity of the events, we did not consider it appropriate to pool the data, and we therefore downgraded the quality of evidence by a further level for imprecision using GRADE. Authors' conclusions It is not possible to draw any conclusions from this review. The included studies were mainly small (fewer than 120 participants) and there were limited estimates of effect, with only two studies reporting any events."

According to the news editors, the research concluded: "We cannot therefore determine whether the use of nitrous oxide in general anaesthesia increases, decreases or has no effect on the risk of accidental awareness."

For more information on this research see: Nitrous oxide-based versus nitrous oxide-free general anaesthesia and accidental awareness during general anaesthesia in surgical patients. Cochrane Database of Systematic Reviews, 2016;(8):1728-1806. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Study Data from University of Maryland Update Understanding of Science (A Role of the FUZZY ONIONS LIKE Gene in Regulating Cell Death and Defense in Arabidopsis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Science is the subject of a report. According to news reporting originating in Baltimore, Maryland, by NewsRx journalists, research stated, "Programmed cell death (PCD) is critical for development and responses to environmental stimuli in many organisms. FUZZY ONIONS (FZO) proteins in yeast, flies, and mammals are known to affect mitochondrial fusion and function."

The news reporters obtained a quote from the research from the University of Maryland, "Arabidopsis FZO-LIKE (FZL) was shown as a chloroplast protein that regulates chloroplast morphology and cell death. We cloned the FZL gene based on the lesion mimic phenotype conferred by an fzl mutation. Here we provide evidence to support that FZL has evolved new function different from its homologs from other organisms. We found that fzl mutants showed enhanced disease resistance to the bacterial pathogen Pseudomonas syringae and the oomycete pathogen Hyaloperonospora arabidopsidis. Besides altered chloroplast morphology and cell death, fzl showed the activation of reactive oxygen species (ROS) and autophagy pathways. FZL and the defense signaling molecule salicylic acid form a negative feedback loop in defense and cell death control. FZL did not complement the yeast strain lacking the FZO1 gene."

According to the news reporters, the research concluded: "Together these data suggest that the Arabidopsis FZL gene is a negative regulator of cell death and disease resistance, possibly through regulating ROS and autophagy pathways in the chloroplast."

For more information on this research see: A Role of the FUZZY ONIONS LIKE Gene in Regulating Cell Death and Defense in Arabidopsis. Scientific Reports, 2016;6():1-12. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Hydrochloric Acid

Study Data from University of Medicine Update Knowledge of Hydrochloric Acid (Trospium chloride is absorbed from two intestinal "absorption windows" with different permeability in healthy subjects)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hydrochloric Acid are discussed in a new report. According to news reporting originating in Greifswald, Germany, by NewsRx journalists, research stated, "Intestinal P-glycoprotein is regio-selectively expressed and is a high affinity, low capacity efflux carrier for the cationic, poorly permeable trospium."

The news reporters obtained a quote from the research from the University of Medicine, "Organic cation transporter 1 (OCT1) provides lower affinity but higher capacity for trospium uptake. To evaluate regional intestinal permeability, absorption profiles after gastric infusion of trospium chloride (30 mg/250 ml = [I](2)) for 6 h and after swallowing 30 mg immediate-release tablets in fasted and fed healthy subjects, were evaluated using an inverse Gaussian density function to model input rate and mean absorption time (MAT). Trospium chloride was slowly absorbed (MAT similar to 10 h) after gastric infusion involving two processes with different input rates, peaking at about 3 h and 7 h. Input rates and MAT were influenced by dosage form and meal."

According to the news reporters, the research concluded: "Trospium is absorbed from two 'windows' located in the jejunum and cecum/ascending colon, whose uptake capacity might result from local abundance and functional interplay of P-glycoprotein and OCT1."

Keywords for this news article include: Greifswald, Germany, Europe, Hydrochloric Acid, Glycoconjugates, Glycoproteins, Chlorides, Anions, University of Medicine.

Heart Disorders and Diseases - Cardiomyopathies

Study Data from University of Medicine and Dentistry of New Jersey (UMDNJ) Provide New Insights into Cardiomyopathies (Mitochondrial autophagy in cardiomyopathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
Wellness Week -- New research on Heart Disorders and Diseases - Cardiomyopathies is the subject of a report. According to news reporting originating from New Brunswick, New Jersey, by NewsRx correspondents, research stated, "Cardiac mitochondria produce vast amounts of ATP through oxidative phosphorylation to maintain contractile function. They are also the primary source of reactive oxygen species, which contribute to mitochondrial dysfunction, cardiomyocyte death, and heart failure."

Funders for this research include U.S. Public Health Service, Leducq Foundation Transatlantic Network of Excellence.

Our news editors obtained a quote from the research from the University of Medicine and Dentistry of New Jersey (UMDNJ), "To protect against mitochondrial damage, cardiomyocytes develop well-coordinated quality control mechanisms that maintain the overall mitochondrial health through mitochondrial biogenesis, mitochondrial dynamics, and mitochondrial autophagy (mitophagy). Mitophagy removes dysfunctional mitochondria in the heart not only under normal physiological conditions, but also in response to pathological stresses. Accumulating evidence suggests that mitophagy dysregulation can induce cardiomyocyte death and cardiomyopathy."

According to the news editors, the research concluded: "In this review, we discuss what is currently known about mitophagic mechanisms, regulatory pathways, and function in the heart."

The news editors report that additional information may be obtained by contacting J. Sadoshima, Rutgers New Jersey Med Sch, Dept. of Cell Biol & Mol Med, New Brunswick, NJ 08901, United States.

Herpesvirus Diseases and Conditions -
Study Data from University of Minnesota Update Understanding of Cytomegalovirus (Cytomegalovirus Vaccines: Current Status and Future Prospects)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Herpesvirus Diseases and Conditions - Cytomegalovirus is now available. According to news reporting from Minneapolis, Minnesota, by NewsRx journalists, research stated, "Congenital human cytomegalovirus (HCMV) infection can result in
severe and permanent neurological injury in newborns, and vaccine development is accordingly a major public health priority. HCMV can also cause disease in solid organ transplant (SOT) and hematopoietic stem-cell transplant (HSCT) recipients, and a vaccine would be valuable in prevention of viremia and end-organ disease in these populations."

Financial supporters for this research include National Institute of Child Health and Human Development, National Institute of Allergy and Infectious Diseases, National Institute of Dental and Craniofacial Research.

The news correspondents obtained a quote from the research from the University of Minnesota, "Currently there is no licensed HCMV vaccine, but progress toward this goal has been made in recent clinical trials. A recombinant HCMV glycoprotein B (gB) vaccine has been shown to have some efficacy in prevention of infection in young women and adolescents, and has provided benefit to HCMV-seronegative SOT recipients. Similarly, DNA vaccines based on gB and the immunodominant T-cell target, pp65 (ppUL83), have been shown to reduce viremia in HSCT patients. This review provides an overview of HCMV vaccine candidates in various stages of development, as well as an update on the current status of ongoing clinical trials. Protective correlates of vaccine-induced immunity may be different for pregnant woman and transplant patients."

According to the news reporters, the research concluded: "As more knowledge emerges about correlates of protection, the ultimate licensure of HCMV vaccines may reflect the uniqueness of the target populations being immunized."

Our news journalists report that additional information may be obtained by contacting M.R. Schleiss, University of Minnesota, Div Pediat Infect Dis & Immunol, Dept. of Pediat, Center Infect Dis & Microbiol Translat ResMed Sch, Minneapolis, MN 55455, United States. Additional authors for this research include C.J. Bierle and M.R. Schleiss.

Drugs and Therapies - Immunotherapy

Study Data from University of Minnesota Update Understanding of Immunotherapy (Induced Pluripotent Stem Cell-Derived Natural Killer Cells for Treatment of Ovarian Cancer)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Immunotherapy are presented in a new report. According to news reporting from Minneapolis, Minnesota, by NewsRx journalists, research stated, "Natural killer (NK) cells can provide effective immunotherapy for ovarian cancer. Here, we evaluated the ability of NK cells isolated from peripheral blood (PB) and NK cells derived from induced pluripotent stem cell (iPSC) to mediate killing of ovarian cancer cells in a mouse xenograft model."

Funders for this research include Immunotherapy for Ovarian Cancer Mayo Clinic Ovarian Cancer SPORE, NIH grant, National Institutes of Health Award Number, Hematology Research Training Grant.

The news correspondents obtained a quote from the research from the University of Minnesota, "A mouse xenograft model was used to evaluate the intraperitoneal delivery of three different NK cell populations: iPSC-derived NK cells, PB-NK cells that had been activated and expanded in long-term culture, and overnight activated PB-NK cells that were isolated through CD3/CD19 depletion of PB B and T cells. Bioluminescent imaging was used to monitor tumor burden of luciferase expressing tumor lines. Tumors were allowed to establish prior to administering NK cells via intraperitoneal injection. These studies demonstrate a single dose of any of the three NK cell populations significantly reduced tumor burden. When mice were given three doses of either iPSC-NK cells or expanded PB-NK cells, the median survival improved from 73 days in mice untreated to 98 and 97 days for treated mice, respectively. From these studies, we conclude iPSC-derived NK cells mediate antiovarian cancer killing at least as well as PB-NK cells, making these cells a viable resource for immunotherapy for ovarian cancer."

According to the news reporters, the research concluded: "Due to their ability to be easily differentiated into NK cells and their long-term expansion potential, iPSCs can be used to produce large numbers of well-defined NK cells that can be banked and used to treat a large number of patients including treatment with multiple doses if necessary."

Our news journalists report that additional information may be obtained by contacting D.L. Hermanson, Dept. of Medicine (Division of Hematology, Oncology and Transplant), University of Minnesota, Minneapolis, Minnesota, United States. Additional authors for this research include L. Bendzick, L. Pribyl, V. McCullar, R.I. Vogel, J.S. Miller, M.A. Geller and D.S Kaufman.

Mitomycins

Study Data from University of Monastir Update Understanding of Mitomycins (Genotoxic and anti-genotoxic effects of esculin and its oligomer fractions against mitomycin C-induced DNA damages in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Mitomycins have been presented. According to news reporting from Monastir, Tunisia, by NewsRx journalists, research stated, "Mitomycin C is one of the most effective chemotherapeutic drugs against various solid tumors. However, despite its wide spectrum of clinical benefits, this agent is capable of inducing various types of genotoxicity."

Financial support for this research came from Ministry of Higher Education and Scientific Research of Tunisia.

The news correspondents obtained a quote from the research from the University of Monastir, "In this study, we investigated the effect of esculin and its oligomer fractions (E1, E2 and E3) against mitomycin C induced genotoxicity in liver and kidney cells isolated from Balb/C mice using the comet assay. Esculin and its oligomer fractions were not genotoxic at the tested doses (20 mg/kg and 40 mg/kg b.w). A significant decrease in DNA damages was observed, suggesting a protective role of esculin and its oligomer fractions against the genotoxicity induced by mitomycin C on liver and kidney cells."

According to the news reporters, the research concluded: "Moreover, esculin and its oligomer fractions did not induce an increase of malondialdehyde levels."

For more information on this research see: Genotoxic and anti-genotoxic effects of esculin and its oligomer fractions against mitomycin C-induced DNA damages in mice. Regulatory Toxicology and Pharmacology, 2016;82():48-52. Eye Diseases and Conditions - Myopia

Study Data from University of New South Wales Provide New Insights into Myopia (An examination of the relation between intraocular pressure, fundal stretching and myopic pathology)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Eye Diseases and Conditions - Myopia. According to news reporting out of Kensington, Australia, by NewsRx editors, the research stated, "Pathological myopia is one of the leading causes of visual impairment worldwide. Myopic development and progression is biomechanical and dominated by axial elongation."

Our news journalists obtained a quote from the research from the University of New South Wales, "This clinical perspective examines some of the stretch-related fundal changes, which are associated with axial elongation and myopic pathology. The biomechanics of stretching of the fundus appears to depend on genetically and/or visual experience-based scleral changes, which reduce its thickness and elastic modulus so that it becomes more susceptible to the distending forces of intraocular pressure. These changes include reduced collagen synthesis, altered collagen fibres, tissue loss, altered proteoglycans and increased matrix metalloproteinase activity. Such changes are associated with reduced scleral rigidity and related increased potential to stretch in response to intraocular pressure. As axial elongation progresses, the sclera appears likely to continue to reduce in thickness and in its capacity to resist intraocular pressure, especially when pressure becomes elevated. Tessellation, lacquer cracks, myopic crescents, staphylomata, chorioretinal atrophy and retinal detachment are examined within a model for stretching of the fundus. Age, refractive error and axial length, for example, are associated with increased pathological progression. Myopic pathological progression can become dominated by vascular changes and include a greater risk of loss of acuity and blindness. Measures to control myopic pathology, which successfully slow or prevent stretching of the fundus, appear to be key factors in reducing or even avoiding permanent visual loss associated with this condition. For example, limiting axial elongation and related myopic fundus pathology by inhibiting changes which reduce the elastic modulus of scleral tissue is a desirable outcome from interventions to control myopia."

According to the news editors, the research concluded: "Similarly, reducing exposure to the distending stress of elevated intraocular pressure appears to be a desirable form of intervention to control myopia, especially if myopic pathology can be reduced or prevented."

Our news journalists report that additional information may be obtained by contacting C.W. McMonnies, School of Optometry and Vision Science, University of New South Wales, Kensington, Australia.

Study Data from University of North Carolina Update Understanding of Epstein-Barr Virus (Karyotypic abnormalities associated with Epstein-Barr virus status in classical Hodgkin lymphoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Human Herpesvirus Diseases and Conditions - Epstein-Barr Virus is the subject of a report. According to news reporting from Chapel Hill, North Carolina, by NewsRx journalists, research stated, "Classical Hodgkin lymphoma (CHL) is morphologically characterized by scattered malignant Hodgkin/Reed Sternberg (HRS) cells that are far outnumbered by surrounding reactive hematolymphoid cells. Approximately half of all cases of CHL are associated with infection by Epstein Barr virus (EBV), an oncogenic herpesvirus that expresses a number of proteins thought to contribute to transformation."

The news correspondents obtained a quote from the research from the University of North Carolina, "While a small number of published studies have attempted to identify recurrent cytogenetic abnormalities in CHL, no large case series have explored karyotypic differences between EBV-positive and EBV-negative tumors. Here, we report a two-institution retrospective investigation of cytogenetic features characterizing CHL. In our cohort, cases of EBV-negative CHL were characterized by more complex routine karyotypes than their EBV-positive counterparts (24.6 versus 15.6 independent aberrations per case, P = 0.009). The increased complexity of EBV-negative cases was driven by a number of features suggestive of genomic instability, including a larger number of independent chromosomal breakpoints (P = 0.03) and apparently aneuploid autosomes (P = 0.008). Compelling but nonsignificant trends also suggest a larger modal number and increased marker chromosomes in EBV-negative cases (P = 0.13 and 0.06, respectively). While some of these differences are related to histologic subtype, others appear independent of histology."

According to the news reporters, the research concluded: "Finally, a significant subset of EBV-positive tumors has a surprisingly simple karyotype relative to what is normally seen in CHL, an observation suggesting considerable biological and genetic diversity in this disease."

Keywords for this news article include: Chapel Hill, North Carolina, United States, North and Central America, Human Herpesvirus Diseases and Conditions, Lymphatic Diseases and Conditions, Immunoproliferative Disorders, Lymphoproliferative Disorders, Tumor Virus Infections, Lymphomas, Genetics, Human Herpesvirus 4, Epstein-Barr Virus, Tumor
Study Data from University of Paris Provide New Insights into Thrombocytopenia (Long-term complications of splenectomy in adult immune thrombocytopenia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hematologic Diseases and Conditions - Thrombocytopenia. According to news reporting originating from Creteil, France, by NewsRx correspondents, research stated, "The recent large decrease in splenectomy use for chronic immune thrombocytopenia (ITP) is partly due to still-unsolved questions about long-term safety. We performed the first single-center exposed/unexposed cohort study evaluating the long-term incidence of splenectomy complications in patients with primary ITP."

Our news editors obtained a quote from the research from the University of Paris, "Overall, 83 patients who underwent splenectomy more than 10 years ago (exposed) were matched with 83 nonsplenectomized patients (unexposed) on the date of ITP diagnosis +/- 5 years, age and gender. After a median follow-up of 192 months (range 0.5-528), 43 patients (52%) achieved overall response after splenectomy. Splenectomized patients experienced more venous thromboembolism (VTE) than controls (n = 13 vs n = 2, P = 0.005). On multivariate analysis, splenectomy was an independent risk factor of VTE (hazard ratio = 4.006, P = 0.032 [95% confidence interval: 1.13-14.21]). Splenectomized patients presented more severe infections on long-term follow-up: all required hospitalization, and 5/26 (19%) infections led to severe sepsis or septic shock and to death for 3 cases (none in controls). However, the incidence of malignancy was similar in both groups, as was cardiovascular risk, which appeared to be related more to ITP than splenectomy. Finally, splenectomy did not significantly decrease overall survival."

According to the news editors, the research concluded: "Despite the risk of thrombosis and severe sepsis, splenectomy remains an effective and curative treatment for ITP."

For more information on this research see: Long-term complications of splenectomy in adult immune thrombocytopenia. Medicine, 2016;95(48):27-33. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

The news editors report that additional information may be obtained by contacting M. Mahevas, Univ Paris Est Creteil, Hopital Henri Mondor, AP HP, Center Reference Cytopenies Autoimmunes Adulte, Creteil, France. Additional authors for this research include M. Mahevas, F. Pharmacology

Study Data from University of Pittsburgh Update Knowledge of Pharmacology [New perspectives on mTOR inhibitors (rapamycin, rapalogs and TORKinibs) in transplantation]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pharmacology. According to news reporting originating from Pittsburgh, Pennsylvania, by NewsRx correspondents, research stated, "The macrolide rapamycin and its analogues (rapalogs) constitute the first generation of mammalian target of rapamycin (mTOR) inhibitors. Since the introduction of rapamycin as an immunosuppressant, there has been extensive progress in understanding its complex mechanisms of action."

Our news editors obtained a quote from the research from the University of Pittsburgh, "New insights into the function of mTOR in different immune cell types, vascular endothelial cells and neoplastic cells have opened new opportunities and challenges regarding mTOR as a pharmacological target. Currently, the two known mTOR complexes, mTOR complex (mTORC) 1 and mTORC2, are the subject of intense investigation, and the introduction of second-generation dual mTORC kinase inhibitors (TORKinibs) and gene knockout mice is helping to uncover the distinct roles of these complexes in different cell types. While the pharmacological profiling of rapalogs is advanced, much less is known about the properties of TORKinibs. A potential benefit of mTOR inhibition in transplantation is improved protection against transplant-associated viral infections compared with standard calcineurin inhibitor-based immunosuppression. Preclinical and clinical data also underscore the potentially favourable antitumour effects of mTOR inhibitors in regard to transplant-associated malignancies and as a novel treatment option for various other cancers. Many aspects of the mechanisms of action of mTOR inhibitors and their clinical implications remain unknown."

According to the news editors, the research concluded: "In this brief review we discuss new findings and perspectives of mTOR inhibitors in transplantation."

The news editors report that additional information may be obtained by contacting A.W. Thomson, University of Pittsburgh, Dept. of Immunol, Pittsburgh, PA, United States. Additional authors for this research include D. Fantus, M. Solari and A.W. Thomson.

Keywords for this news article include: Pittsburgh, Pennsylvania, United States, North and Central America, Therapy, Article Review, Pharmacology, University of Pittsburgh.

Cardiovascular Diseases and Conditions - Thrombosis

Study Data from University of Pittsburgh Update Knowledge of Thrombosis (Intracranial venous injury, thrombosis and repair as hallmarks of mild blast traumatic brain injury in rats: Lessons from histological and immunohistochemical studies of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Thrombosis is now available. According to news reporting from Pittsburgh, Pennsylvania, by NewsRx journalists, research stated, "Many previous experimental studies of blast wave effects have reported vascular and parenchymal injury in brains extracted from the skulls prior to histopathological assessment. Brain removal disrupts vasculature and structural features of the meninges that may be sources of signs and symptoms of mild traumatic brain injury, particular at lower blast overpressures (<5 psi peak)."

The news correspondents obtained a quote from the research from the University of Pittsburgh, "New method: Immunohistochemical and histopathological studies have been conducted in sections from decalcified, paraffin embedded, histologically sectioned whole rat heads. These sections preserve the entire cranial contents in situ, and permit evaluation of the inner ear, central nervous system and associated vasculature. The findings could also be correlated with mRNA expression patterns from whole brains subjected to similar treatment. Lower levels of blast wave exposure produce primarily vascular effects in rats. Messenger RNA profiles of the whole brains showed evidence of both blast intensity and time dependent effects on vascular wound healing markers. The rats exposed to 10-11 psi overpressure tended to show a similar pattern of mRNA expression changes in these vascular repair and inflammatory pathways as rats exposed to approximately 5 psi overpressure, but the changes were greater. The changes in mRNA expression after a 14-15 psi exposure were different and suggestive of more severe injury, particularly for DNA repair, lymphocyte activation and lymphocyte migration pathways. Histopathological examination of decalcified heads revealed that even 2.5-7.9 psi blast exposures produced a high prevalence of mild venous hemorrhage and thrombosis (accompanied by inflammatory markers) in the inner ear, vertebrobasilar circulation, hippocampal choroidal fissure and the veins associated with velum interpositum. Comparison with existing method(s): The sites of vascular injury would not have been included in specimens extracted from the skull prior to processing. The isolated regions of intravascular coagulation in small veins and the isolated, very small venous hemorrhages in the subarachnoid space are worthy of consideration as factors in both healing and chronic sequelae of mild blast concussion. Although small, remnants persisted in the subarachnoid space even 42 days after a single blast exposure."

According to the news reporters, the research concluded: "The high prevalence of very mild subdural and subarachnoid hemorrhage may be a target for clinical management."

For more information on this research see: Intracranial venous injury, thrombosis and repair as hallmarks of mild blast traumatic brain injury in rats: Lessons from histological and immunohistochemical studies of decalcified sectioned heads and correlative microarray analysis. *Journal of Neuroscience Methods*, 2016;272():56-68. *Journal of Neuroscience Methods* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Mosquito-Borne Diseases - Dengue Hemorrhagic Fever

Study Data from University of Science Malaysia Update Understanding of Dengue Hemorrhagic Fever [Allelic variants of cytochrome P450 monooxygenases: Constitutive and insecticide-mediated expression in a Malaysian strain of the dengue vector, ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Mosquito-Borne Diseases - Dengue Hemorrhagic Fever. According to news reporting out of Penang, Malaysia, by NewsRx editors, research stated, "Cytochrome P450s (P450s) involved in insecticide resistance reduce the efficacy of insecticide-based vector control by rendering vector control ineffective. They are recorded in many species of vectors and have various constitutive and insecticide induction profiles."

Our news journalists obtained a quote from the research from the University of Science Malaysia, "In this study, the isolation and prediction of the structure of a P450 from a strain of Aedes aegypti originating from Malaysia is reported. Quantitative mRNA expression of this gene and a previously reported P450, CYP4H28v2, in the developmental stages of the mosquito after exposure to sub-lethal concentrations of insecticides is also reported. The isolated P450, CYP4H31v2, is an allelic variant of CYP4H31 and contains several conserved motifs of P450s. The secondary structure of the protein is mostly made up of alpha helices and random coils. The tertiary structure was generated using homology modeling and was of good quality based on structure validation using protein structure assessment tools. CYP4H28v2 and CYP4H31v2 were differentially expressed in the developmental stages of the vector, with a significantly increased expression in adult males. The genes were significantly over-expressed in larvae exposed to deltamethrin and permethrin for 6 h. In the DDT-treated larvae, only CYP4H31v2 was significantly over-expressed after a 6 h exposure. Under-expression of the genes was predominant in larvae treated with the organophosphates malathion and temephos."

According to the news editors, the research concluded: "Though the functions of these P450s are unknown, their response to induction by exposure to insecticides indicates the likely involvement of these genes in insecticide tolerance."

For more information on this research see: Allelic variants of cytochrome P450

Our news journalists report that additional information may be obtained by contacting F.M.A. El-Garj, University of Sains Malaysia, Sch Distance Educ, Mol Entomol Res Grp, Minden 11800, Penang, Malaysia. Additional authors for this research include M.F.F. Wajidi and S.W. Avicor.

**Blood Diseases and Conditions - Sepsis**

**Study Data from University of South Carolina Update Understanding of Sepsis (Effectiveness of oral antibiotics for definitive therapy of Gram-negative bloodstream infections)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Blood Diseases and Conditions - Sepsis is the subject of a report. According to news reporting originating from Columbia, South Carolina, by NewsRx correspondents, research stated, "There is paucity of data evaluating intravenous-to-oral antibiotic switch options for Gram-negative bloodstream infections (BSIs). This retrospective cohort study examined the effectiveness of oral antibiotics for definitive treatment of Gram-negative BSI."

Financial support for this research came from Infectious Disease Society of America Education and Research Foundation.

Our news editors obtained a quote from the research from the University of South Carolina, "Patients with Gram-negative BSI hospitalised for <14 days at Palmetto Health Hospitals in Columbia, SC, from 1 January 2010 through 31 December 2013 and discharged on oral antibiotics were included in this study. The cohort was stratified into three groups based on bioavailability of oral antibiotics prescribed (high, >= 95%; moderate, 75-94%; and low, <75%). Kaplan-Meier analysis and multivariate Cox proportional hazards regression were used to examine treatment failure. Among the 362 patients, high, moderate and low bioavailability oral antibiotics were prescribed to 106, 179 and 77 patients, respectively, for definitive therapy of Gram-negative BSI. Mean patient age was 63 years, 217 (59.9%) were women and 254 (70.2%) had a urinary source of infection. Treatment failure rates were 2%, 12% and 14% in patients receiving oral antibiotics with high, moderate and low bioavailability, respectively (P = 0.02). Risk of treatment failure in the multivariate Cox model was higher in patients receiving antibiotics with moderate [ adjusted hazard ratio (aHR) = 5.9, 95% CI 1.6-38.5; P = 0.005] and
low bioavailability (aHR = 7.7, 95% CI 1.9-51.5; P = 0.003) compared with those receiving oral antimicrobial agents with high bioavailability. These data demonstrate the effectiveness of oral antibiotics with high bioavailability for definitive therapy of Gram-negative BSI.

According to the news editors, the research concluded: "Risk of treatment failure increases as bioavailability of the oral regimen declines."

The news editors report that additional information may be obtained by contacting M.N. Al-Hasan, University of South Carolina, Sch Med, Dept. of Med, Div Infect Dis, Columbia, SC, United States. Additional authors for this research include J.A. Justo, P.B. Bookstaver, J. Kohn, H. Albrecht and M.N. Al-Hasan.

BTB using the single comparative intradermal tuberculin (SCIT) test, with BTB-positive animals culled, and negative animals released. BTB prevalence was spatially and temporally variable, ranging from 2.3% to 54.7%. Geographic area was a strong predictor of BTB transmission in HiP, owing to relatively stable herds and home ranges. Herds experiencing more intensive and frequent captures showed reduced per capita disease transmission risk and less increase in herd prevalence over time. Disease hot spots did not expand spatially over time, and BTB prevalence in all but the hot spot areas was maintained between 10% and 15% throughout the study period. Our data suggest that HiP's test and cull programme was effective at reducing BTB transmission in buffalo, with capture effort and interval found to be the crucial components of the programme. The programme was thus successful with respect to the original goals; however, there are additional factors that should be considered in future cost/benefit analyses and decision-making.

According to the news reporters, the research concluded: "These findings may be utilized and expanded in future collaborative work between wildlife managers, veterinarians and scientists, to optimize wildlife disease control programmes and mitigate conflict at the interface of conservation, agricultural and urban areas."

Our news correspondents report that additional information may be obtained by contacting N. le Roex, University of Stellenbosch, DST NRF Center Excellence Biomed TB Res, MRC Center Mol & Cellular Biol, Div Mol Biol & Human GenetFac Hlth Sci, Cape Town, South Africa. Gram-Positive Bacteria – Enterococcus faecalis

Study Data from University of Tehran Provide New Insights into Enterococcus faecalis (The in vitro effect of antimicrobial photodynamic therapy with indocyanine green on Enterococcus faecalis: Influence of a washing vs non-washing procedure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Gram-Positive Bacteria - Enterococcus faecalis. According to news reporting originating from Tehran, Iran, by NewsRx
correspondents, research stated, "The purpose of this study was to evaluate the in vitro effect of washing and non-washing of indocyanine green (ICG) as photosensitizer (PS) on bacterial count, biofilm formation, development and degradation of Enterococcus faecalis. The antibacterial, anti-biofilm formation, anti-biofilm development and biofilm degradation of antimicrobial photodynamic therapy (aPDT) against E. faecalis was determined at concentrations of 3 to 2000 μg/mL of ICG, subject to 18 j/cm(2) dose of diode laser (808 nm) in washing and non-washing producers."

Financial support for this research came from Laser Research Center of Dentistry. Our news editors obtained a quote from the research from the University of Tehran, "Bacterial viability measurements and biofilm assays were evaluated by broth microdilution method and crystal violet assays, respectively. ICG-mediated aPDT, using 25 to 2000 μg/mL and 50 to 2000 pugimL showed significant reduction in E. faecalis growth when compared to the control in non-washing and washing producers, respectively (P <0.05). Also, ICG-mediated aPDT showed a significantly inhibitory effect on biofilm formation of E. faecalis in concentration of 6 to 2000 μg/mL and 100 to 2000 μg/mL in non-washing and washing groups (P <0.05). The biofilm development was inhibited by concentrations of 12 to 2000 μg/mL and 100 to 2000 μg/mL in non-washing and washing groups. The biofilm degradation increased from concentrations of 12 to 2000 ilgimL and 250 to 2000 μg/mL in non-washing and washing groups, respectively."

According to the news editors, the research concluded: "This study shows that the application of ICG should be accompanied by laser irradiation without being washed out to achieve better result for bacterial count reduction and anti-biofilm effects."

For more information on this research see: The in vitro effect of antimicrobial photodynamic therapy with indocyanine green on Enterococcus faecalis: Influence of a washing vs non-washing procedure. Photodiagnosis and Photodynamic Therapy, 2016;16():119-123. Photodiagnosis and Photodynamic Therapy can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Study Data from University of Texas Provide New Insights into Melanoma (Tumor-Intrinsic PD-L1 Signals Regulate Cell Growth, Pathogenesis, and Autophagy in Ovarian Cancer and Melanoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Melanoma are discussed in a new report. According to news reporting originating from San Antonio, Texas, by NewsRx correspondents, research stated, "PD-L1 antibodies produce efficacious clinical responses in diverse human cancers, but the basis for their effects remains unclear, leaving a gap in the understanding of how to rationally leverage therapeutic activity. PD-L1 is widely expressed in tumor cells, but its contributions to tumor pathogenicity are incompletely understood."

Our news editors obtained a quote from the research from the University of Texas, "In this study, we evaluated the hypothesis that PD-L1 exerts tumor cell-intrinsic signals that are critical for pathogenesis. Using RNAi methodology, we attenuated PD-L1 in the murine ovarian cell line ID8agg and the melanoma cell line B16 (termed PD-L1(lo) cells), which express basal PD-L1. We observed that PD-L1(lo) cells proliferated more weakly than control cells in vitro. As expected, PD-L1(lo) cells formed tumors in immunocompetent mice relatively more slowly, but unexpectedly, they also formed tumors more slowly in immunodeficient NSG mice. RNA sequencing analysis identified a number of genes involved in autophagy and mTOR signaling that were affected by PD-L1 expression. In support of a functional role, PD-L1 attenuation augmented autophagy and blunted the ability of autophagy inhibitors to limit proliferation in vitro and in vivo in NSG mice. PD-L1 attenuation also reduced mTORC1 activity and augmented the antiproliferative effects of the mTORC1 inhibitor rapamycin. PD-L1(lo) cells were also relatively deficient in metastasis to the lung, and we found that anti-PD-L1 administration could block tumor cell growth and metastasis in NSG mice. This therapeutic effect was observed with B16 cells but not ID8agg cells, illustrating tumor-or compartmental-specific effects in the therapeutic setting."

According to the news editors, the research concluded: "Overall, our findings extend understanding of PD-L1 functions, illustrate nonimmune effects of anti-PD-L1 immunotherapy, and suggest broader uses for PD-L1 as a biomarker for assessing cancer therapeutic responses."

For more information on this research see: Tumor-Intrinsic PD-L1 Signals Regulate Cell Growth, Pathogenesis, and Autophagy in Ovarian Cancer and Melanoma. Cancer Research, 2016;76(23):6964-6974. Cardiovascular Research

Study Data from University of Texas Southwestern Update Knowledge of Cardiovascular Research [SCCT guidelines for the performance and acquisition of coronary computed tomographic angiography: A report of the society of Cardiovascular Computed ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Research are presented in a new report. According to news originating from Dallas, Texas, by NewsRx correspondents, research stated, "In response to recent technological advancements in acquisition techniques as well as a growing body of evidence regarding the optimal performance of coronary computed tomography angiography (coronary CTA), the Society of Cardiovascular Computed Tomography Guidelines Committee has produced this update to its previously established 2009 'Guidelines for the Performance of Coronary CTA' (1)."

Our news journalists obtained a quote from the research from the University of Texas Southwestern, "The purpose of this document is to provide standards meant to ensure reliable practice methods and quality outcomes based on the best available data in order to improve the diagnostic care of patients. Society of Cardiovascular Computed Tomography Guidelines for the Interpretation is published separately (2)."

According to the news editors, the research concluded: "The Society of Cardiovascular Computed Tomography Guidelines Committee ensures compliance with all existing standards for the declaration of conflict of interest by all authors and reviewers for the purpose of clarity and transparency."

The news correspondents report that additional information may be obtained from S. Abbara, Univ Texas Southwestern Med Center Dallas, Dallas, TX 75390, United States. Study Data from University of Tokyo Provide New Insights into Measles (Development of new therapy for canine mammary cancer with recombinant measles virus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Measles are presented in a new report. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "Oncolytic virotherapy is a promising treatment strategy for cancer. We previously generated a recombinant measles virus (rMV-SLAMblind) that selectively uses a poliovirus receptor-related 4 (PVRL4/Nectin4) receptor, but not signaling lymphocyte activation molecule (SLAM)."

The news correspondents obtained a quote from the research from the University of Tokyo, "We demonstrated that the virus exerts therapeutic effects against human breast cancer cells. Here, we examined the applicability of rMV-SLAMblind to treating canine mammary cancers (CMCs). We found that the susceptibilities of host cells to rMV-SLAMblind were dependent on canine Nectin-4 expression. Nectin-4 was detected in four of nine CMC cell lines. The rMV-SLAMblind efficiently infected those four Nectin-4-positive cell lines and was cytotoxic for three of them (CF33, CHMm, and CTBm). In vivo experiment showed that the administration of rMV-SLAMblind greatly suppressed the progression of tumors in mice xenografted with a CMC cell line (CF33). Immunohistochemistry revealed that canine Nectin-4 was expressed in 45% of canine mammary tumors, and the tumor cells derived from one clinical specimen were efficiently infected with rMV-SLAMblind. These results suggest that rMV-SLAMblind infects CMC cells and displays antitumor activity in vitro, in xenografts, and ex vivo."

According to the news reporters, the research concluded: "Therefore, oncolytic virotherapy with rMV-SLAMblind can be a novel method for treating CMCs."

For more information on this research see: Development of new therapy for canine mammary cancer with recombinant measles virus. Molecular Therapy-Oncolytics, 2016;3():1-8. Molecular Therapy-Oncolytics can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA.

Oncology - Breast Cancer

Study Data from University of Toronto Update Understanding of Breast Cancer (Total cost-effectiveness of mammography screening strategies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Breast Cancer is now available. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "Breast cancer screening technology and treatment have improved over the past decade. This analysis evaluates the total cost-effectiveness of various breast cancer screening strategies in Canada."

Our news editors obtained a quote from the research from the University of Toronto, "Data and methods: Using the Wisconsin Cancer Intervention and Surveillance Monitoring Network (CISNET) breast cancer simulation model adapted to the Canadian context, costs and quality-adjusted life years (QALY) were evaluated for 11 mammography screening strategies that varied by start/stop age and screening frequency for the general population. Incremental cost-effectiveness ratios are presented, and sensitivity analyses are used to assess the robustness of model conclusions. Incremental cost-effectiveness analysis showed that triennial screening at ages 50 to 69 was the most cost-effective at $94,762 per QALY. Biennial ($97,006 per QALY) and annual ($226,278 per QALY) strategies had higher incremental ratios. The benefits and costs of screening rise with the number of screens per woman."

According to the news editors, the research concluded: "Decisions about screening strategies may be influenced by willingness to pay and the rate of recall for further examination after positive screens."

For more information on this research see: Total cost-effectiveness of mammography screening strategies. Health Reports, 2015;26(12):16-25. Health Reports can be contacted at: Statistics Canada, 100 Tunneys Pasture Driveway, Ottawa, Ontario K1A 0T6, Canada.

The news editors report that additional information may be obtained by contacting N. Mittmann, University of Toronto, Toronto, ON M5S 1A1, Canada. Additional authors for this research include N.K. Stout, P. Lee, A.N.A. Tosteson, A. Trentham-Dietz, O. Alagoz and M.J. Yaffe.

Pediatrics - Pediatric Nephrology

Study Data from University of Toronto Update Understanding of Pediatric Nephrology (C3 Glomerulopathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pediatrics - Pediatric Nephrology have been published. According to news reporting originating in Toronto, Canada, by NewsRx journalists,
research stated, "Recent advances in our understanding of the disease pathology of membranoproliferative glomerulonephritis has resulted in its re-classification as complement C3 glomerulopathy (C3G) and immune complex-mediated glomerulonephritis (IC-GN). The new consensus is based on its underlying pathomechanism, with a key pathogenetic role for the complement alternative pathway (AP), rather than on histomorphological characteristics."

The news reporters obtained a quote from the research from the University of Toronto, "In C3G, loss of AP regulation leads to predominant glomerular C3 deposition, which distinguishes C3G from IC-GN with predominant immunoglobulin G staining. Electron microscopy further subdivides C3G into C3 glomerulonephritis and dense deposit disease depending on the presence and distribution pattern of electron-dense deposits within the glomerular filter. Mutations or autoantibodies affecting the function of AP activators or regulators, in particular the decay of the C3 convertase (C3 nephritic factor), have been detected in up to 80% of C3G patients. The natural outcome of C3G is heterogeneous, but 50% of patients progress slowly and reach end-stage renal disease within 10-15 years."

According to the news reporters, the research concluded: "The new classification not only marks significant advancement in the pathogenetic understanding of this rare disease, but also opens doors towards more specific treatment with the potential for improved outcomes."

For more information on this research see: C3 Glomerulopathy. Pediatric Nephrology, 2017;32(1):43-57. Pediatric Nephrology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Pediatric Nephrology - www.springerlink.com/content/0931-041x/)

Immunology - Granulocytes

Study Data from University of Utah Provide New Insights into Granulocytes (P-Selectin Sustains Extramedullary Hematopoiesis in the Gata1 low Model of Myelofibrosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Immunology - Granulocytes are discussed in a new report. According to news reporting originating in Salt Lake City, Utah, by NewsRx journalists, research stated, "Splenomegaly is a major manifestation of primary myelofibrosis (PMF) contributing to clinical symptoms and hematologic abnormalities. The spleen from PMF patients contains increased numbers of hematopoietic stem cells (HSC) and megakaryocytes (MK)."

Funders for this research include National Cancer Institute, Associazione Italiana
Ricerca sul Cancro, Brian Rooney Fund of the Lymphoma Foundation.

The news reporters obtained a quote from the research from the University of Utah, "These MK express high levels of P-selectin (P-sel) that, by triggering neutrophil emperipolesis, may cause TGF-b release and disease progression. This hypothesis was tested by deleting the P-sel gene in the myelofibrosis mouse model carrying the hypomorphic Gata1(low) mutation that induces megakaryocyte abnormalities that recapitulate those observed in PMF. P-sel(null) Gata1(low) mice survived splenectomy and lived 3 months longer than P-sel(WT) Gata1(low) littermates and expressed limited fibrosis and osteosclerosis in the marrow or splenomegaly. Furthermore, deletion of P-sel disrupted megakaryocyte/neutrophil interactions in spleen, reduced TGF-b content, and corrected the HSC distribution that in Gata1(low) mice, as in PMF patients, is abnormally expanded in spleen. Conversely, pharmacological inhibition of TGF-b reduced P-sel expression in MK and corrected HSC distribution. Spleens, but not marrow, of Gata1(low) mice contained numerous cKIT(pos) activated fibrocytes, probably of dendritic cell origin, whose membrane protrusions interacted with MK establishing niches hosting immature cKIT(pos) hematopoietic cells. These activated fibrocytes were not detected in spleens from P-sel(null) Gata1(low) or TGF-b-inhibited Gata1(low) littermates and were observed in spleen, but not in marrow, from PMF patients."

According to the news reporters, the research concluded: "Therefore, in Gata1(low) mice, and possibly in PMF, abnormal P-sel expression in MK may mediate the pathological cell interactions that increase TGF-b content in MK and favor establishment of a microenvironment that supports myelofibrosis-related HSC in spleen."

Our news correspondents report that additional information may be obtained by contacting G.J. Spangrude, Dept. of Medicine, Division of Hematology and Hematologic Malignancies, University of Utah, Salt Lake City, Utah, United States. Additional authors for this research include D. Lewandowski, F. Martelli, M. Marra, M. Zingariello, L. Sancillo, R.A. Rana and A.R Migliaccio.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/stem.2229. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Heart Failure

Study Data from University of Virginia Provide New Insights into Heart Failure (Decreased Pulmonary Arterial Proportional Pulse Pressure After Pulmonary Artery Catheter Optimization for Advanced Heart Failure Is Associated With Adverse Clinical ...)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Failure have been published. According to news reporting from Charlottesville, Virginia, by NewsRx journalists, research stated, "This study evaluated the novel index pulmonary arterial proportional pulse pressure (PAPP) in the Evaluation Study of Congestive Heart Failure and Pulmonary Artery Catheterization Effectiveness (ESCAPE) trial. Multivariable Cox proportional hazards and logistical regression were used to model 6-month death; death, transplantation, or left ventricular assist device (DTLVAD); and DTLVAD or heart failure rehospitalization (DTLVADHF) with respect to PAPP."

The news correspondents obtained a quote from the research from the University of Virginia, "Among 175 patients with final hemodynamic data, 15.5% and 33.9%, respectively, died in optimal PAPP (PAPP >0.50) and nonoptimal PAPP (PAPP <= 0.50) groups (P =.008), and PAPP was independently associated with death, DTLVAD, and DTLVADHF (P <.01 for all outcomes). The hypothesized logistic regression model with pulmonary capillary wedge pressure, creatinine, and nonoptimal PAPP had an area under the curve of 0.818 (P <.0001) for death. Furthermore, PAPP as a continuous variable was the most powerful predictor of DTLVADHF (hazard ratio 0.793 per 0.1 increase in PAPP [95% confidence interval 0.659-0.955], chi square 8.80; P =.01) in the Cox model, with no other clinical, laboratory, or hemodynamic parameters significant after adjustment for PAPP. PAPP, a novel parameter for right-sided proportional pulse pressure, is an independent and powerful predictor of adverse clinical outcomes in advanced HF."

According to the news reporters, the research concluded: "Increased PAPP promises to be a useful therapeutic target in patients with pulmonary arterial pressure assessment."

For more information on this research see: Decreased Pulmonary Arterial Proportional Pulse Pressure After Pulmonary Artery Catheter Optimization for Advanced Heart Failure Is Associated With Adverse Clinical Outcomes. *Journal of Cardiac Failure*, 2016;22Q (12):954-961. *Journal of Cardiac Failure* can be contacted at: Churchill Livingstone Inc Medical Publishers, Curtis Center, Independence Square West, Philadelphia, PA 19106-3399, USA. Heart Disorders and Diseases - Heart Attack

Study Data from University of Washington Update Knowledge of Heart Attack (Determining witnessed status for out-of-hospital cardiac arrest)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news reporting originating in Seattle, Washington, by NewsRx journalists, research stated, "Witnessed status is considered a core variable in reporting cardiac arrest data and can be ascertained from either the emergency dispatch recording or the pre-hospital record. The purpose of this study is to compare and assess the quality and consistency of these information sources."

The news reporters obtained a quote from the research from the University of Washington, "This retrospective analysis included 1896 cases of out-of-hospital cardiac arrest occurring between September 1, 2012 and December 31, 2014. We found that there was minimal (kappa = 0.30, 95% CI 0.27-0.33) to moderate (kappa = 0.64, 95% CI 0.59-0.69) agreement between the pre-hospital record and the emergency dispatch recording when these sources of information are used to determine witnessed status. Witnessed status could not be determined from the emergency dispatch recording in 36.2% (n = 684) of eligible cases. Survival was similar regardless of the method used to determine witnessed status. Using a combination of the pre-hospital record and the emergency dispatch recording yielded the highest number of witnessed cases. The determination of witnessed status in out-of-hospital cardiac arrest may be challenging, as evidenced by the discrepancies in witnessed status when comparing different sources of information. The large number of cases where the witnessed status could not be determined from the emergency dispatch recording precludes its use as the sole source of information."

According to the news reporters, the research concluded: "It is reasonable to use the patient care record alone, however it should be recognized that there is misclassification of witnessed status regardless of the method used and this may affect the strength of association between witnessed status and survival."

Our news correspondents report that additional information may be obtained by contacting M.M. Lewis, University of Washington, Sch Med, Seattle, WA 98195, United States. Additional authors for this research include B.A. Stubbs and M.S. Eisenberg.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.resuscitation.2016.08.022. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Antifungals

Study Data from V. Ong and Co-Authors Update Knowledge of Antifungals (Preclinical Evaluation of the Stability, Safety, and Efficacy of CD101, a Novel Echinocandin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antifungals is the subject of a report. According to news reporting out of San Diego, California, by NewsRx editors, research stated, "Fungal infections pose a significant public health burden with high morbidity and mortality. CD101 is a novel echinocandin under development for the treatment and prevention of systemic Candida infections."

Our news journalists obtained a quote from the research, "Preclinical studies were conducted to evaluate the metabolic stability, plasma protein binding, pharmacokinetics, toxicity, and efficacy of CD101 at various dose levels. CD101 was stable to biotransformation in rat, monkey, and human liver microsomes and rat, monkey, dog, and human hepato-cytes. In vitro studies suggest minimal interaction with recombinant cytochrome P450 enzymes (50% inhibitory concentrations [IC(50)s] of > 10 μM). Similar to anidulafungin, CD101 bound avidly (>98%) to human, mouse, rat, and primate plasma proteins. In a 2-week repeat-dose comparison study, CD101 was well tolerated in rats (no effects on body weight, hematology, coagulation, or urinalysis). In contrast, administration of anidulafungin (at comparable exposure levels) resulted in reduced body weight, decreases in red blood cell, hemoglobin, hematocrit, mean cell volume, mean corpuscular hemoglobin, platelet, and reticulocyte counts, increases in neutrophil and eosinophil counts, polychromasia, and decreased activated partial thromboplastin time. Elevated plasma transaminases, total bilirubin, cholesterol, and globulin, dark and enlarged spleens, and single-cell hepatocyte necrosis were also observed for anidulafungin but not CD101. Hepatotoxicity may be due to the inherent chemical lability of anidulafungin generating potentially reactive intermediates. A glutathione trapping experiment confirmed the formation of a reactive species from anidulafungin, whereas CD101 did not exhibit instability or reactive intermediates. CD101 showed antifungal activity against Candida and Aspergillus infections in neutropenic mice."

According to the news editors, the research concluded: "These preclinical studies demonstrated that CD101 is chemically and metabolically stable, well tolerated with no hepatotoxicity, and efficacious as an antifungal agent."

Our news journalists report that additional information may be obtained by contacting V. Ong, Cidara Therapeut Inc, San Diego, CA 92121, United States. Additional authors for this research include G. Hough, M. Schlouser, K. Bartizal, J.M. Balkovec, K.D. James and B.R. Krishnan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1128/AAC.00701-16. This DOI is a link to an online electronic document that is either free or for purchase.
Immune System Diseases and Conditions - HIV/AIDS

Study Data from V.R. Gutlapalli et al Provide New Insights into HIV/AIDS (High levels of plasma interferon gamma and +874T/A gene polymorphism is associated with HIV-TB co-infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Immune System Diseases and Conditions - HIV/AIDS. According to news reporting originating from Hyderabad, India, by NewsRx correspondents, research stated, "Tuberculosis (TB) is one of the most frequent opportunistic infections in HIV patients leading to increased morbidity and death rate. This study was carried out to investigate the role of the cytokines IFN-gamma and TNF-alpha level and their single nucleotide polymorphisms (SNPs) in HIV-TB co-infection."

Our news editors obtained a quote from the research, "247 HIV-TB (124 HIV-pulmonary TB, 123 HIV-extra pulmonary TB), 126 HIV positive individuals without tuberculosis and 129 healthy subjects (HS) were included to measure plasma levels of IFN-gamma and TNF-alpha by sandwich ELISA and One way ANOVA statistical analysis was carried out among the groups. The SNPs of TNF-alpha-308 G/A, -238 G/A and IFN-gamma + 874 T/A were also investigated using amplification refractory mutation system polymerase chain reaction (ARMS-PCR). The frequencies between the groups were compared by Pearson's chi square statistical analysis. Plasma IFN-gamma and TNF-alpha were significantly elevated in HIV-TB and TB (p < 0.05) as compared to those in HS group. There was significant association between IFN-gamma + 874 ‘A’ allele and AA genotype in HIV-TB groups compared to HS and HIV (p < 0.05) and no such association was found for TNF-alpha-308 and -238. The plasma cytokine levels of TNF-alpha and IFN-gamma reveals no significant association with levels of IFN-gamma + 874 T/A, TNF-alpha-308 G/A and-238 G/A genotypes in any of the study groups. In conclusion, the present study revealed elevated plasma IFN-gamma and its +874 ‘A’ allele are associated with HIV-TB co-infection indicating 1.6 times increased risk for TB susceptibility."

According to the news editors, the research concluded: "Elevated TNF-alpha levels in TB and HIV-TB suggest its involvement in TB pathogenesis."

For more information on this research see: High levels of plasma interferon gamma and +874T/A gene polymorphism is associated with HIV-TB co-infection. Human Immunology, 2016;77(12):1264-1270. Drugs and Therapies - Antibiotics

Study Data from VIT University Update Knowledge of Antibiotics (Effect of chitosan molecular weight of chitosan-citrate film on site specific in vitro release of Ofloxacin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antibiotics are presented in a new report. According to news reporting originating in Tamil Nadu, India, by NewsRx journalists, research stated, "Chitosan, a biodegradable and biocompatible polysaccharide, is a potentially useful material in various fields. Chitosan films with different molecular weights (MW) of chitosan were developed followed by incorporation of Ofloxacin as a model drug by a casting/solvent evaporation technique."

The news reporters obtained a quote from the research from VIT University, "And citrate cross-linked films were prepared simply by dipping film into sodium citrate solution. The swelling ratio of citrate/chitosan film was sensitive to pH and ionic strength studied here. These films were characterized by release and swelling studies, Differential scanning colorimetry (DSC), Optical microscope coupled with Raman spectroscopy, Scanning electron colorimetry (SEM), Drug release based on cross linking time. Concentration of cross linking agent significantly influenced the in vitro release of drug as well of swelling of the films. The higher the MW of chitosan lower release rate was observed. The present study showed that MW and cross linking time of films regulated the varying swelling and drug release at pH 3.5 and pH 6.2."

According to the news reporters, the research concluded: "In addition, it indicated that the citrate/chitosan films were useful in drug delivery i.e. site-specific controlled drug release in stomach."

For more information on this research see: Effect of chitosan molecular weight of chitosan-citrate film on site specific in vitro release of Ofloxacin. *Journal of the Indian Chemical Society*, 2016;93(9):1107-1114. *Journal of the Indian Chemical Society* can be contacted at: Scientific Publ-India, 5-A, New Pali Rd, PO Box 91, Near Hotel Taj Hari Mahal, Jodhpur, 342 003, India.

**Congenital Diseases and Conditions - Congenital...**

**Study Data from Vanderbilt University Update Knowledge of Congenital Generalized Lipodystrophy (Characterization of a caveolin-1 mutation associated with both pulmonary arterial hypertension and congenital generalized lipodystrophy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Congenital Diseases and Conditions - Congenital Generalized Lipodystrophy. According to news originating from Nashville, Tennessee, by NewsRx correspondents, research stated, "Congenital generalized lipodystrophy (CGL) and pulmonary arterial hypertension (PAH) have recently been associated with mutations in the caveolin-1 (CAV1) gene, which encodes the primary structural protein of caveolae. However, little is currently known about how these CAV1 mutations impact caveolae formation or contribute to the development of disease."

Our news journalists obtained a quote from the research from Vanderbilt University, "Here, we identify a heterozygous F160X CAV1 mutation predicted to generate a C-terminally truncated mutant protein in a patient with both PAH and CGL using whole exome sequencing, and characterize the properties of CAV1, caveolae-associated proteins and caveolae in skin fibroblasts isolated from the patient. We show that morphologically defined caveolae are present in patient fibroblasts and that they function in mechanoprotection. However, they exhibited several notable defects, including enhanced accessibility of the C-terminus of wild-type CAV1 in caveolae, reduced colocalization of cavin-1 with CAV1 and decreased stability of both 8S and 70S oligomeric CAV1 complexes that are necessary for caveolae formation. These results were verified independently in reconstituted CAV1(-/-) mouse embryonic fibroblasts."

According to the news editors, the research concluded: "These findings identify defects in caveolae that may serve as contributing factors to the development of PAH and CGL and broaden our knowledge of CAV1 mutations associated with human disease."

The news correspondents report that additional information may be obtained from A.K. Kenworthy, Vanderbilt University, Dept. of Mol Physiol & Biophys, Nashville, TN 37221, United States. Additional authors for this research include C.A. Copeland, Y. Kawano, E.B. Rosenzweig, E.D. Austin, L. Shahmirzadi, S. Tang, K. Raghunathan, W.K. Chung and A.K. Kenworthy.

Central Nervous System Diseases and Conditions -

Study Data from Veterans Affairs Medical Center Provide New Insights into Brain Injuries [Microglial Activation Induced by the Alarmin S100B is Regulated by Poly(ADP-ribose) Polymerase-1]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Central Nervous System Diseases and Conditions - Brain Injuries. According to news reporting originating in San Francisco, California, by NewsRx journalists, research stated, "Brain injury resulting from stroke or trauma can be exacerbated by the release of proinflammatory cytokines, proteases, and reactive oxygen species by activated microglia. The microglial activation resulting from brain injury is mediated in part by alarmins, which are signaling molecules released from damaged cells."

The news reporters obtained a quote from the research from Veterans Affairs Medical Center, "The nuclear enzyme poly(ADP-ribose) polymerase-1 (PARP-1) has been shown to regulate microglial activation after brain injury, and here we show that signaling effects of the alarmin S100B are regulated by PARP-1. S100B is a protein localized predominantly to astrocytes. Exogenous S100B added to primary microglial cultures induced a rapid change in microglial morphology, upregulation of IL-1 beta, TNF alpha, and iNOS gene expression, and release of matrix metalloproteinase 9 and nitric oxide. Most, though not all of these effects were attenuated in PARP-1(-/-) microglia and in wild-type microglia treated with the PARP inhibitor, veliparib. Microglial activation and gene expression changes induced by S100B injected directly into brain were likewise attenuated by PARP-1 inhibition."

According to the news reporters, the research concluded: "The anti-inflammatory effects of PARP-1 inhibitors in acutely injured brain may thus be mediated in part through effects on S100B signaling pathways."

Our news correspondents report that additional information may be obtained by contacting R.A. Swanson, San Francisco VA Med Center, San Francisco, CA, United States. Additional authors for this research include H.D. Wang, S.J. Won, J. Basu, D. Kapfhamer and R.A. Swanson.

Study Data from Virginia University Medical Center Provide New Insights into Immunoglobulins (Monoclonal antibodies targeting CD38 in hematological malignancies and beyond)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immunology - Immunoglobulins. According to news reporting originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "CD38 is a multifunctional cell surface protein that has receptor as well as enzyme functions. The protein is generally expressed at low levels on various hematological and solid tissues, while plasma cells express particularly high levels of CD38."

Our news editors obtained a quote from the research from Virginia University Medical Center, "The protein is also expressed in a subset of hematological tumors, and shows especially broad and high expression levels in plasma cell tumors such as multiple myeloma (MM). Together, this triggered the development of various therapeutic CD38 antibodies, including daratumumab, isatuximab, and MOR202. Daratumumab binds a unique CD38 epitope and showed strong anti-tumor activity in preclinical models. The antibody engages diverse mechanisms of action, including complement-dependent cytotoxicity, antibody-dependent cellular cytotoxicity, antibody-dependent cellular phagocytosis, programmed cell death, modulation of enzymatic activity, and immunomodulatory activity. CD38-targeting antibodies have a favorable toxicity profile in patients, and early clinical data show a marked activity in MM, while studies in other hematological malignancies are ongoing. Daratumumab has single agent activity and a limited toxicity profile, allowing favorable combination therapies with existing as well as emerging therapies, which are currently evaluated in the clinic."

According to the news editors, the research concluded: "Finally, CD38 antibodies may have a role in the treatment of diseases beyond hematological malignancies, including solid tumors and antibody-mediated autoimmune diseases."

The news editors report that additional information may be obtained by contacting N.W. van de Donk, Dept. of Hematology, VU University Medical Center, Amsterdam, Netherlands. Additional authors for this research include M.L. Janmaat, T. Mutis, J.J. Lammerts van Bueren, T. Ahmadi, A.K. Sasser, H.M. Lokhorst and P.W Parren.

Study Data from Wake Forest University Provide New Insights into Acidosis (Deletion of proton-sensing receptor GPR4 associates with lower blood pressure and lower binding of angiotensin II receptor in SFO)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Acidosis have been published. According to news reporting from Winston Salem, North Carolina, by NewsRx journalists, research stated, "Diets rich in grains and meat and low in fruits and vegetables (acid-producing diets) associate with incident hypertension, whereas vegetarian diets associate with lower blood pressure (BP). However, the pathways that sense and mediate the effects of acid-producing diets on BP are unknown."

The news correspondents obtained a quote from the research from Wake Forest University, "Here, we examined the impact of the deletion of an acid sensor GPR4 on BP. GPR4 is a proton-sensing G protein-coupled receptor and an acid sensor in brain, kidney, and blood vessels. We found that GPR4 mRNA was higher in subfornical organ (SFO) than other brain regions. GPR4 protein was abundant in SFO and present in capillaries throughout the brain. Since SFO partakes in BP regulation through the renin-angiotensin system (RAS), we measured BP in GPR4-/- and GPR4+/+ mice and found that GPR4 deletion associated with lower systolic BP: 87 +/- 1 mmHg in GPR4-/- (n = 35) vs. 99 +/- 2 mmHg (n = 29) in GPR4+/+; P< 0.0001, irrespective of age and sex. Angiotensin II receptors detected by 125I-Sarthran binding were lower in GPR4-/- than GPR4-/- mice in SFO and in paraventricular nucleus of hypothalamus. Circulating angiotensin peptides were comparable in GPR4-/- and GPR4+/+ mice, as were water intake and excretion, serum and urine osmolality, and fractional excretion of sodium, potassium, or chloride. A mild metabolic acidosis present in GPR4-/- mice did not associate with elevated BP, implying that deficiency of GPR4 may preclude the effect of chronic acidosis on BP."

According to the news reporters, the research concluded: "Collectively, these results posit the acid sensor GPR4 as a novel component of central BP control through interactions with the RAS."

For more information on this research see: Deletion of proton-sensing receptor GPR4 associates with lower blood pressure and lower binding of angiotensin II receptor in SFO. American Journal of Physiology-Renal Physiology, 2016;311(6):F1260-F1266. American Journal of Physiology-Renal Physiology can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Our news journalists report that additional information may be obtained by contacting S. Petrovic, Wake Forest Sch Med, Hypertens & Vasc Res Center, Winston Salem, NC, United States. Additional authors for this research include E. Tommasi, D. Molina, R. Sah, K.B. Brosnihan, D. Diz and S. Petrovic.

Study Data from Washington State University Provide New Insights into Environmental Health (Retest of a Principal Components Analysis of Two Household Environmental Risk Instruments)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Environmental Health have been presented. According to news reporting originating in Spokane, Washington, by NewsRx journalists, research stated, "Household Risk Perception (HRP) and Self-Efficacy in Environmental Risk Reduction (SEERR) instruments were developed for a public health nurse-delivered intervention designed to reduce home-based, environmental health risks among rural, low-income families. The purpose of this study was to test both instruments in a second low-income population that differed geographically and economically from the original sample."

The news reporters obtained a quote from the research from Washington State University, "Participants (N = 199) were recruited from the Women, Infants, and Children (WIC) program. Paper and pencil surveys were collected at WIC sites by research-trained student nurses. Exploratory principal components analysis (PCA) was conducted, and comparisons were made to the original PCA for the purpose of data reduction. Instruments showed satisfactory Cronbach alpha values for all components. HRP components were reduced from five to four, which explained 70% of variance. The components were labeled sensed risks, unseen risks, severity of risks, and knowledge. In contrast to the original testing, environmental tobacco smoke (ETS) items was not a separate component of the HRP. The SEERR analysis demonstrated four components explaining 71% of variance, with similar patterns of items as in the first study, including a component on ETS, but some differences in item location. Although low-income populations constituted both samples, differences in demographics and risk exposures may have played a role in component and item locations. Findings provided justification for changing or reducing items, and for tailoring the instruments to population-level risks and behaviors."

According to the news reporters, the research concluded: "Although analytic refinement will continue, both instruments advance the measurement of environmental health risk perception and self-efficacy."

Our news correspondents report that additional information may be obtained by contacting G.A. Oneal, Washington State University, Coll Nursing, Spokane, WA 99210, United States. Additional authors for this research include J. Postma, T. Odom-Maryon and P. Butterfield.

Cyclohexanes

Study Data from Washington University Provide New Insights into Cyclohexanes (A Clickable Analogue of Ketamine Retains NMDA Receptor Activity, Psychoactivity, and Accumulates in Neurons)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cyclohexanes. According to news reporting out of St. Louis, Missouri, by NewsRx editors, research stated, "Ketamine is a psychotomimetic and antidepressant drug. Although antagonism of cell-surface NMDA receptors (NMDARs) may trigger ketamine's psychoactive effects, ketamine or its major metabolite norketamine could act intracellularly to produce some behavioral effects."

Our news journalists obtained a quote from the research from Washington University, "To explore the viability of this latter hypothesis, we examined intracellular accumulation of novel visualizable analogues of ketamine/norketamine. We introduced an alkyne 'click' handle into norketamine (alkyne-norketamine, A-NK) at the key nitrogen atom. Ketamine, norketamine, and A-NK, but not A-NK-amide, showed acute and persisting psychoactive effects in mice. This psychoactivity profile paralleled activity of the compounds as NMDAR channel blockers; A-NK-amide was inactive at NMDARs, and norketamine and A-NK were active but similar to 4-fold less potent than ketamine. We incubated rat hippocampal cells with 10 mu M A-NK or A-NK-amide then performed Cu2+ catalyzed cycloaddition of azide-Alexa Fluor 488, which covalently attaches the fluorophore to the alkyne moiety in the compounds. Fluorescent imaging revealed intracellular localization of A-NK but weak A-NK-amide labeling. Accumulation was not dependent on membrane potential, NMDAR expression, or NMDAR activity. Overall, the approach revealed a correlation among NMDAR activity, intracellular accumulation/retention, and behavioral effects."

According to the news editors, the research concluded: "Thus, we advance first generation chemical biology tools to aid in the identification of ketamine targets."

For more information on this research see: A Clickable Analogue of Ketamine Retains NMDA Receptor Activity, Psychoactivity, and Accumulates in Neurons. Scientific Reports, 2016;6():1-17. Cyclohexanes

Study Data from Washington University Update Knowledge of Cyclohexanes (Role of Cytochrome P4502B6 Polymorphisms in Ketamine Metabolism and Clearance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cyclohexanes is the subject of a report. According to news reporting from St. Louis, Missouri, by NewsRx journalists, research stated, "At therapeutic concentrations, cytochrome P4502B6 (CYP2B6) is the major P450 isoform catalyzing hepatic ketamine N-demethylation to norketamine in vitro. The CYP2B6 gene is highly polymorphic."

The news correspondents obtained a quote from the research from Washington University, "The most common variant allele, CYP2B6*6, is associated with diminished hepatic CYP2B6 expression and catalytic activity compared with wild-type CYP2B6*1/*1. CYP2B6.6, the protein encoded by the CYP2B6*6 allele, and liver microsomes from CYP2B6*6 carriers had diminished ketamine metabolism in vitro. This investigation tested whether humans with the CYP2B6*6 allele would have decreased clinical ketamine metabolism and clearance. Thirty volunteers with CYP2B6*1/*1, *1/*6, or *6/*6 genotypes (n = 10 each) received a subEdosing dose of oral ketamine. Plasma and urine concentrations of ketamine and the major CYP2B6-dependent metabolites were determined by mass spectrometry. Subjects' self-assessment of ketamine effects were also recorded. The primary outcome was ketamine N-demethylation, measured as the plasma norketamine/ketamine area under the curve ratio. Secondary outcomes included plasma ketamine enantiomer and metabolite area under the plasma concentration-time curve, maximum concentrations, apparent oral clearance, and metabolite formation clearances. There was no significant difference between CYP2B6 genotypes in ketamine metabolism or any of the secondary outcome measures. Subjective self-assessment did reveal some differences in energy and level of awareness among subjects. These results show that while the CYP2B6*6 polymorphism results in diminished ketamine metabolism in vitro, this allelic variant did not affect single, low-dose ketamine metabolism, clearance, and pharmacokinetics in vivo."

According to the news reporters, the research concluded: "While in vitro drug metabolism studies may be informative, clinical investigations in general are needed to validate in vitro observations."

For more information on this research see: Role of Cytochrome P4502B6 Polymorphisms in Ketamine Metabolism and Clearance. Anesthesiology, 2016;125(6):1103-1112. Anesthesiology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Study Data from Wenzhou Medical University Update Knowledge of Liver Cancer (AKT/mTOR signaling pathway is involved in salvianolic acid B-induced autophagy and apoptosis in hepatocellular carcinoma cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Liver Cancer. According to news originating from Zhejiang, People's Republic of China, by NewsRx correspondents, research stated, "Chinese medicines are emerging as an attractive new generation of anticancer drugs. Here, we explored the impact of salvianolic acid B (Sal B), the major water-soluble compounds of Danshen, on apoptosis and autophagy of human hepatocellular carcinoma cells (HCC)."

Our news journalists obtained a quote from the research from Wenzhou Medical University, "We also investigated the related molecular mechanisms. We found that Sal B exhibits potent ability to inhibit HCC cells viability in a concentration-dependent manner, and to induce apoptosis via the mitochondrial apoptosis pathway. Additionally, Sal B could also induce autophagy. Furthermore, pretreatment with the autophagy inhibitor chloroquine or 3-methyladenine showed the potential in attenuating the apoptosis rate induced by Sal B. Mechanistically, Sal B treatment inhibited the AKT/mTOR signaling cascade in vitro. Overexpression of AKT abolished the effects of Sal B on HCC cells, suggesting a critical role of the AKT/mTOR signaling pathway in Sal B-induced biological effects. Our results indicated that the mitochondrial pathway was involved in Sal B-induced apoptosis of HCC cells. Moreover, the AKT/mTOR signaling pathway was involved in Sal B-induced autophagy, which promoted apoptosis."

According to the news editors, the research concluded: "This study may provide a promising strategy for using Sal B as a chemotherapeutic agent for patients with HCC."

For more information on this research see: AKT/mTOR signaling pathway is involved in salvianolic acid B-induced autophagy and apoptosis in hepatocellular carcinoma cells. International Journal of Oncology, 2016;49(6):2538-2548. International Journal of Oncology can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

The news correspondents report that additional information may be obtained from W. Zhang, Wenzhou Med Univ, Dept. of Pharm, Affiliated Hosp 1, Wenzhou 325000, Zhejiang, People's Republic of China. **Fibroblasts**

**Study Data from Wuhan University Update Knowledge of Fibroblasts**

(MicroRNA221-3p modulates Ets-1 expression in synovial fibroblasts from patients with osteoarthritis of temporomandibular joint)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Fibroblasts. According to news originating from Wuhan, People's Republic of China, by NewsRx correspondents, research stated, "This study aimed to screen differential expression of microRNAs (miRNAs), and investigate function of the specifically selected miRNA in synovial fibroblasts from patients suffering osteoarthritis of temporomandibular joint (TMJOA). MiRNA microarray was used to select differentially expressed miRNAs between TMJOA and normal synovial fibroblasts."

Financial support for this research came from National Science Foundation of China.

Our news journalists obtained a quote from the research from Wuhan University, "The expression of screened miRNA221-3p was quantified using real-time PCR, and its specific target gene was predicted by bioinformatics. After transfection of miRNA221-3p mimics or inhibitor into synovial fibroblasts, the expression of v-Ets avian erythroblastosis virus E26 oncogene homolog 1 (Ets-1) was detected by immunohistochemistry, real-time PCR and Western blot, respectively. Dual luciferase activity was performed to identify the direct regulation of miRNA221-3p on Ets-1. Interlukin-1 beta (IL-1 beta) mimics an inflammatory situation. In TMJOA synovial fibroblasts, eight miRNAs were up-regulated and six miRNAs were down-regulated. MiRNA221-3p was the most down-expressed. A sequence in the 3'-untranslated (3'-UTR) of Ets-1 complementary to the seed sequence of miRNA221-3p. Elevated expression of Ets-1 associated with attenuation of miRNA221-3p. Over-expression of miRNA221-3p suppressed the activity of a reporter construct containing the 3'-UTR of Ets-1 transcript and inhibited the expression of Ets-1 as well as its downstream molecules, matrix metalloproteinase 1 (MMP1) and MMP9 in TMJOA synovial fibroblasts. IL-1 beta suppressed the expression of miRNA221-3p in both a dose-dependent and time-dependent manner."

According to the news editors, the research concluded: "The reduction of miRNA221-3p in synovial fibroblasts, attributed from abundance of IL-1 beta in inflamed circumstance, induces Ets-1 up-regulation and then, initiates MMP1 and MMP9 secretion, thereby leading to continuously pathological development in TMJOA."

The news correspondents report that additional information may be obtained from X. Long, Wuhan University, Sch & Hosp Stomatol, Dept. of Oral & Maxillofacial Surg, Wuhan 430079, Hubei Province, People's Republic of China. Additional authors for this research include Y. Liu, M. Deng, J. Li, H. Cai, Q. Meng, W. Fang, X. Long and J. Ke.

Study Data from X.H. Zhao et al Provide New Insights into Oncology (MiR-203 promotes the growth and migration of ovarian cancer cells by enhancing glycolytic pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology. According to news originating from Haikou, People's Republic of China, by NewsRx correspondents, research stated, "MicroRNAs (miRNAs) play an important role in the tumorigenesis of ovarian cancer. Previously, we have reported the dysregulation of miR-203 in the ovarian cancer tissues."

Financial support for this research came from China Tobacco Guangxi Industrial.

Our news journalists obtained a quote from the research, "However, the biological functions and molecular mechanisms of miR-203 in ovarian cancer remain unknown. Here, we showed that the expression of miR-203 was increased in ovarian cancer tissues compared with the adjacent non-cancerous tissues and the transcription of miR-203 was inhibited by P53. Forced expression of miR-203 in ovarian cancer promoted cell growth and migration, while depletion of miR-203 inhibited the growth and migration of ovarian cancer cells. In addition, miR-203 promoted the metastasis of ovarian cancer cells in vivo and shortened the survival of the nude mice. Mechanically, miR-203 targeted the 3'-UTR of pyruvate dehydrogenase B (PDHB) and increased the consumption of glucose and the production of lactate. Overexpression of PDHB abolished the oncogenic effects of miR-203 on the growth of ovarian cancer cells."

According to the news editors, the research concluded: "Together, our data suggested the oncogenic roles of miR-203 in ovarian cancer by promoting glycolysis, and miR-203 might be a therapeutic target for ovarian cancer."

For more information on this research see: MiR-203 promotes the growth and migration of ovarian cancer cells by enhancing glycolytic pathway. Tumor Biology, 2016;37 (11):14989-14997. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

Study Data from Xuzhou Medical College Update Knowledge of Lipopolysaccharides (Induction of heat shock protein 27 by bicyclol attenuates D-galactosamine/lipopolysaccharide-induced liver injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Lipopolysaccharides are discussed in a new report. According to news reporting from Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Heat shock proteins (Hsps) are critical for cell survival under adverse environmental conditions. Bicyclol is a novel hepatoprotectant that has been shown to protect against liver injury by inducing Hsps, including Hsp27 and Hsp70."

Financial support for this research came from National Natural Science Foundation of China, China.

The news correspondents obtained a quote from the research from Xuzhou Medical College, "Although the role of Hsp70 in protecting against acute hepatic failure has been clearly explored, the precise function of Hsp27 in this setting is poorly defined. This study was undertaken to evaluate the role of Hsp27 in bicyclol-mediated hepatoprotection. Both primary hepatocytes and bone marrow-derived macrophages were subjected to bicyclol treatment, followed by detection of Hsp27 expression. Adenoviruses containing the mouse Hsp27 coding sequence or shRNA interference sequence targeting Hsp27 were used to manipulate Hsp27 expression in the liver before the mice were treated with bicyclol and/or confronted with D-galactosamine/lipopolysaccharide (Galn/LPS)-induced acute liver damage. Only hepatocytes increased their Hsp27 expression after bicyclol treatment and the time course of bicyclol-induced Hsp27 expression in hepatocytes was in line with the in vivo results. Although high dose bicyclol could protect against liver failure without Hsp27, the effect of bicyclol given at a low dose was dependent on Hsp27 induction. Adenovirus-mediated transduction of Hsp27 protected against acute liver damage and partially replicated the protective effect afforded by bicyclol. These results demonstrated that bicyclol induced Hsp27 expression in hepatocytes, which was essential to bicyclol-mediated hepatoprotection."

According to the news reporters, the research concluded: "Overexpression of Hsp27 in hepatocytes could confer remarkable protection against acute liver damage."

Our news journalists report that additional information may be obtained by contacting Y.G. Song, Affiliated Huaian Hosp, Xuzhou Medical College, Dept. of Thyroid & Breast Ontol Surg, Huaian 223001, Jiangsu, People's Republic of China. Additional authors for this research include D.W. Li, Y.X. Wang, A.J. Sun, Y.X. Lu, Xin-Ding, Ming-Zhang, Y.G. Song and X.D. Huang.

Study Data from Y. Ito and Co-Authors Update Knowledge of Vasculitis
(Successful treatment of Bordetella bronchiseptica pneumonia by minocycline in anti-neutrophil cytoplasmic antibodies-associated vasculitis patient)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Vasculitis. According to news reporting originating from Shizuoka, Japan, by NewsRx correspondents, research stated, "Bordetella bronchiseptica is a bacterial pathogen usually isolated from animals and rarely causes human infections. There are, however, some reports that B. bronchiseptica causes human respiratory infections in immunocompromised patients or those with underlying respiratory diseases, although there is a lack of treatment guidelines."

Our news editors obtained a quote from the research, "An 80-year-old woman was admitted to our hospital to treat anti-neutrophil cytoplasmic antibodies-associated vasculitis. On the 16th day after admission, she complained of a productive cough with right pleuritic pain and had low-grade fever. After chest CT scans, we diagnosed pneumonia. Gram stain of her sputum revealed moderate levels of gram-negative coccobacilli, which was later identified as B. bronchiseptica by mass spectrometry. According to the result of minimum inhibitory concentration, we successfully treated the pneumonia with minocycline."

According to the news editors, the research concluded: "This case suggests that B. bronchiseptica pneumonia can be treated by minocycline if the minimum inhibitory concentration is less than 0.25 µg/mL."

For more information on this research see: Successful treatment of Bordetella bronchiseptica pneumonia by minocycline in anti-neutrophil cytoplasmic antibodies-associated vasculitis patient. *Journal of Infection and Chemotherapy*, 2016;22(12):808-810. *Journal of Infection and Chemotherapy* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Oncology - Lung Cancer

Study Data from Yale University Update Knowledge of Lung Cancer (Outcomes of a Highly Selective Surgical Approach to Oligometastatic Lung Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Lung Cancer. According to news reporting originating from New Haven, Connecticut, by NewsRx correspondents, research stated, "A highly selected subset of patients with oligometastatic non-small cell lung cancer (NSCLC) will be cured after all sites of established disease (primary and metastases) have been eliminated by surgery or radiation (ie, 'curative intent' approach). Mediastinal lymph node metastases (N2) have been found retrospectively to predict a poor prognosis in this setting (5-year survival of 4% for N2-positive versus 31% for N2-negative)."

Our news editors obtained a quote from the research from Yale University, "Hence, our institution has programmatically limited the use of curative intent local therapy to oligometastatic NSCLC patients confirmed to be free of N2 disease. However, it is unclear whether the exclusion of N2-positive patients is an effective prospective selection step to aggressively treat oligometastatic NSCLC. A prospectively maintained institutional tumor registry was reviewed for oligometastatic stage IV NSCLC patients evaluated for curative intent treatment from 2005 to 2014. All synchronous oligometastatic NSCLC cases were evaluated by invasive mediastinal staging before treatment. Twenty-two patients without N2 disease underwent curative intent treatment, and 13 patients with N2 disease were treated palliatively. The groups were similar by bivariate analyses. The N2-negative patients treated with curative intent had a superior 5-year survival compared with N2-positive patients treated palliatively (58% versus 0%, respectively; p = 0.028). Using invasive mediastinal staging to exclude N2 disease has a role in surgical decision making and achieving long-term survival among oligometastatic NSCLC patients."

According to the news editors, the research concluded: "Further study is warranted to determine whether a subset of patients with N2 disease also have the potential for long-term survival with local therapy."

The news editors report that additional information may be obtained by contacting D.J. Boffa, Yale University, Sch Med, Dept. of Thorac Surg, New Haven, CT, United States. Additional authors for this research include J.E. Rosen, M.C. Salazar and D.J. Boffa.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.athoracsur.2016.04.086. This DOI is a link to an online electronic document that is either free or for purchase.

Study Data from Yamaguchi University Provide New Insights into Aminoglycosides (Quercetin protects against hair cell loss in the zebrafish lateral line and guinea pig cochlea)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Aminoglycosides is now available. According to news originating from Yamaguchi, Japan, by NewsRx correspondents, research stated, "Eighteen supplement drugs were screened using hair cells to determine a protective effect against the adverse effects of neomycin by using the zebrafish lateral line. The zebrafish were administered the supplement drugs 1 h before neomycin exposure."

Our news journalists obtained a quote from the research from Yamaguchi University, "One hour later, animals were fixed in paraformaldehyde. Dose-response curves were generated to evaluate the protective effect on hair cells. The screen identified 3 supplements (quercetin, catechin and tannic acid). Three minutes after exposure to neomycin, increased antioxidant activity was found in the lateral line hair cells, as determined by the analysis of oxidative stress. Quercetin decreases antioxidant activity. The identified drugs were also investigated to determine whether they protect the cochlea against noise-induced hearing loss in guinea pigs. The drugs were administered via the intraperitoneal route in the guinea pigs 3 days before and 4 days after noise exposure. Seven days after noise exposure (130-dB sound pressure level for 3 h), the auditory brainstem response threshold shifts were assessed. We observed that the auditory brainstem response threshold shift was significantly less in the quercetin group than in the vehicle control group."

According to the news editors, the research concluded: "The results of our study indicate that screening drugs using zebrafish can determine additional protective drugs for the inner ear."

For more information on this research see: Quercetin protects against hair cell loss in the zebrafish lateral line and guinea pig cochlea. Hearing Research, 2016;342():80-85. Hearing Research can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Hearing Research - www.journals.elsevier.com/hearing-research/)

The news correspondents report that additional information may be obtained from Y. Hirose, Yamaguchi University, Dept. of Otolaryngol, Grad Sch Med, Ube, Yamaguchi 7558505, Japan. Additional authors for this research include K. Sugahara, E. Kanagawa, Y. Takemoto, M. Hashimoto and H. Yamashita.

Study Data from Yang Ming National University Update Knowledge of Colon Cancer (Serum CA125 concentration as a predictor of peritoneal dissemination of colorectal cancer in men and women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting from Taipei, Taiwan, by NewsRx journalists, research stated, "Peritoneal dissemination (PD) of cancer is difficult to diagnose. Previous reports have shown that carbohydrate antigen 125 (CA125) is a sensitive marker of PD of gastric cancer."

The news correspondents obtained a quote from the research from Yang Ming National University, "However, CA125 has not been evaluated as a marker of colorectal cancer (CRC), and its accuracy in men is controversial. The aim of this study was to compare the ability of CA125 and carcinoembryonic antigen (CEA) to predict PD of CRC in men and women. Preoperative CA125 and CEA concentrations were measured in 853 people (510 men, 343 women) over 10 years. PD was confirmed intraoperatively in 57 patients. The predictive ability was compared between CA125 and CEA. Compared with CEA, CA125 concentration had a lower sensitivity, higher specificity, and diagnostic accuracy, and significantly greater area under the curve. Further analysis of CA125's sensitivity and specificity among CEA-negative group (n=514) showed acceptable sensitivity (57.1%) and good specificity (92.0%). In men and women, CA125 concentration did not increase with stage from I to IV unless PD was present (P <0.001). CEA concentration was increased in women with metastasis with PD (P <0.001) or without PD (P <0.001), but was increased only in men with metastasis without PD (P <0.01). CA125 concentration correlated with PD grade for men and women, but CEA concentration correlated with grade only in women. When analyzed according to the primary tumor site, CA125 concentration in men did not differ between patients with the primary site in the right or left colon, or the rectum, regardless of PD status. By contrast, CA125 concentration differed between PD-positive and PD-negative patients with cancer in the right (P <0.001) or left (P <0.001) colon but not in the rectum. CEA concentration in men did not differ according to the primary site or PD status. In women, CA125 and CEA concentrations differed significantly between the PD-positive and PD-negative groups in patients with the primary tumor in the right (P <0.001) or left (P <0.001) colon; tumor sites did not differ between the PD-positive and PD-negative groups."

According to the news reporters, the research concluded: "These findings suggest that CA125 is a better tumor marker than CEA for predicting PD of CRC in both men and women."

For more information on this research see: Serum CA125 concentration as a predictor of peritoneal dissemination of colorectal cancer in men and women. Medicine, 2016;95(47):60-65. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

**Oncology - Thyroid Cancer**

**Study Data from Yonsei University Update Knowledge of Thyroid Cancer [c-Met-Mediated Reactivation of PI3K/AKT Signaling Contributes to Insensitivity of BRAF(V600E) Mutant Thyroid Cancer to BRAF Inhibition]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Thyroid Cancer are presented in a new report. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "BRAF (V600E) mutation is the most commonly detected genetic alteration in thyroid cancer. Unlike its high treatment response to selective BRAF inhibitor (PLX4032) in metastatic melanoma, the treatment response in thyroid cancer is reported to be low."

The news reporters obtained a quote from the research from Yonsei University, "The purpose of this study is to investigate the resistance mechanism responsible for this low treatment response to BRAF inhibitor in order to maximize the effect of targeted therapy. We examined the expression of feedback regulation mechanisms and alterations in the upper signal transduction pathway in thyroid cancer cell lines harboring BRAF mutation. Also, we investigated the effect of dual inhibition from combinatorial therapy. Two thyroid cancer cell lines, 8505C (anaplastic thyroid cancer) and BCPAP (papillary thyroid cancer) were selected and treated with PLX4032 and its drug sensitivity were examined and compared. Further investigation on the changes in signals responsible for the different treatment response to PLX4032 was carried out and the same experiment was performed on orthotopic xenograft mouse models. Unlike BCPAP cells, 8505C cells presented drug resistance to PLX4032 treatment and this was mainly due to increased expression of c-Met. Effective inhibitions of c-Met, p-AKT, and p-ERK were achieved after dual treatment with BRAF inhibitor (PLX4032) and c-Met inhibitor (PHA665752). Similar results were confirmed by in vivo study with orthotopic xenograft mouse model. c-Met-mediated reactivation of the PI3K/AKT pathway and MAPK pathway contributes to the relative insensitivity of BRAF (V600E) mutant anaplastic thyroid cancer cells to PLX4032."

According to the news reporters, the research concluded: "Dual inhibition of BRAF and c-Met leads to sustained treatment response."

Our news correspondents report that additional information may be obtained by contacting Y.W. Koh, Yonsei University, Coll Med, Dept. of Otorhinolaryngol, Seoul, South Korea. Additional authors for this research include H.J. Na, Y.J. Yang, H.J. Kwon, J.W. Chang,

Nutritional and Metabolic Diseases and Conditions...

Study Data from Z. Sayeed and Co-Authors Update Knowledge of Obesity (Comparing In-Hospital Total Joint Arthroplasty Outcomes and Resource Consumption Among Underweight and Morbidly Obese Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Obesity have been presented. According to news reporting originating in Springfield, Illinois, by NewsRx journalists, research stated, "As orthopedic surgeons search for objective measures that predict total joint arthroplasty (TJA) outcomes, body mass index may aid in risk stratification. The purpose of this study was to compare in-hospital TJA outcomes and resource consumption amongst underweight (body mass index <= 19 kg/m(2)) and morbidly obese patients (>= 40 kg/m(2))."

The news reporters obtained a quote from the research, "Discharge data from 2006 to 2012 National Inpatient Sample were used for this study. A total of 1503 total hip arthroplasty (THA) and 956 total knee arthroplasty (TKA) patients were divided into 2 cohorts, underweight (<= 19 kg/m(2)) and morbidly obese (>= 40 kg/m(2)). Patients were matched by gender and 27 comorbidities by use of Elixhauser Comorbidity Index. Patients were compared for 13 in-hospital postoperative complications, length of stay, total hospital charge, and disposition. Multivariate analyses were generated by SAS software. Significance was assigned at P value <.05. Underweight patients undergoing primary TJA had higher risk for developing postoperative anemia compared with morbidly obese patients (TKA: odds ratio [ OR], 3.1; 95% CI, 2.3-4.1; THA: OR, 1.8; 95% CI, 1.5-2.3). Underweight THA candidates displayed greater risk for deep venous thrombosis (75.36% vs 24.64%; OR, 3.1; 95% CI, 1.1-8.4). Underweight TJA patients were charged more (TKA: USD 51,368.90 vs USD 40,128.80, P = .001, THA: USD 57,451.8 vs USD 42,776.9, P< .001) compared to the morbidly obese patients. Length of stay was significantly longer for underweight THA patients (4.6 days vs 3.5 days, P = .008) compared to morbidly obese counterparts."

According to the news reporters, the research concluded: "Our results indicate underweight, compared to morbidly obese, TJA patients are at a greater risk for postoperative anemia and consume more resources."

Our news correspondents report that additional information may be obtained by

Oncology - Liver Cancer

Study Data from Zhejiang University Provide New Insights into Liver Cancer (Synchronous occurrence of a hepatic myelolipoma and two hepatocellular carcinomas)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Liver Cancer. According to news originating from Hangzhou, People's Republic of China, by NewsRx correspondents, research stated, "Myelolipoma is a rare tumor composed of fat and bone marrow components, most of which are located in the adrenal gland. Myelolipoma in the liver is extremely rare."

Our news journalists obtained a quote from the research from Zhejiang University, "To date, only 10 cases have been reported in the English-language medical literature. In one of these cases, the hepatic myelolipoma was found within a hepatocellular carcinoma (HCC). In the present study, we report the first case of the synchronous occurrence of hepatic myelolipoma and HCCs in different liver sections of one patient, a 26-year-old female who was admitted to our hospital because of a 4-d history of upper abdominal pain. The unenhanced computed tomography (CT) images showed a well-defined low-density mass with adipose components in the right liver lobe, 4.2 cm x 4.1 cm in size. Two inhomogeneous low-density masses were found in the left liver lobe, 8.6 cm x 7.7 cm and 2.6 cm x 2.6 cm in size. The masses in both the right and left liver lobes were heterogeneously enhanced in the contrast-enhanced CT images. Based on the results of the imaging examination, the mass in the right liver lobe was preliminarily considered to be a hamartoma, and the two masses in the left liver were preliminarily considered to be HCCs. We performed a right hepatectomy, a left hepatic lobectomy, and a cholecystectomy."

According to the news editors, the research concluded: "Microscopic and immunohistochemical results revealed that the tumor in the right liver lobe was a hepatic myelolipoma, and that the two tumors in the left liver lobe were HCCs."

The news correspondents report that additional information may be obtained from W.L. Wang, Zhejiang University, Collaborat Innovat Center Diag & Treatment Infect Di, Hangzhou 310003, Zhejiang, People's Republic of China. Additional authors for this research include H.Y. Xie, L. Zhou, S.S. Zheng and W.L. Wang.

**Immune System Diseases and Conditions - Graft-...**

**Study Data from Zhengzhou University Update Understanding of Graft-Versus-Host Disease (Transforming growth factor-b1 polymorphisms and graft-versus-host disease risk: a meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - Graft-Versus-Host Disease. According to news reporting originating in Zhengzhou, People's Republic of China, by NewsRx journalists, research stated, "Some studies have demonstrated that transforming growth factor (TGF)-b polymorphisms may have an important role in the pathological process of graft-versus-host disease (GVHD). However, the results are not consistent."

The news reporters obtained a quote from the research from Zhengzhou University, "Thus, we performed a meta-analysis. Online databases were searched to obtain relevant articles published up until May 2015. Odds ratios (ORs) with 95% confidence intervals (CIs) were used to assess the strength of associations. Donors (OR=0.56; 95%CI, 0.32-0.98; p=0.04) and recipients (OR=0.73; 95%CI, 0.63-0.85; p=0.0001) with TGF-b1 rs1800469 polymorphism showed decreased GVHD risk, respectively. Donors with TGF-b1 rs1800470 polymorphism were also observed to have lower GVHD risk (OR=0.65; 95%CI, 0.46-0.94; p=0.02). However, TGF-b1 rs1800470 polymorphism in recipients was not associated with GVHD risk (OR=1.28; 95%CI, 0.81-2.01; p=0.29). No significant heterogeneity was found in the meta-analysis."

According to the news reporters, the research concluded: "This meta-analysis suggests that donors or recipients with TGF-b1 rs1800469 polymorphism and donors with TGF-b1 rs1800470 polymorphism might be associated with reduced GVHD risk."

Our news correspondents report that additional information may be obtained by contacting L. Zhang, Dept. of Clinical Laboratory, The Fifth Affiliated Hospital of Zhengzhou University, Zhengzhou, Henan, People's Republic of China. Additional authors for this research include L. Mao and J. Xu.

Oncology - Gliomas

**Study Findings from Aligarh Muslim University Provide New Insights into Gliomas (Potential role of Shh-Gli1-BMI1 signaling pathway nexus in glioma chemoresistance)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gliomas. According to news reporting from Aligarh, India, by NewsRx journalists, research stated, "Chemoresistance is a common hurdle for the proper treatment of gliomas. The role of Shh-Gli1 signaling in glioma progression has been reported."

Financial support for this research came from Department of Biotechnology, Govt. of India, New Delhi.

The news correspondents obtained a quote from the research from Aligarh Muslim University, "However, its role in glioma chemoresistance has not been well studied yet. In this work, we found that Shh-Gli1 signaling regulates the expression of one stem cell marker, BMI1 (B cell-specific Moloney murine leukemia virus), in glioma. Interestingly, we also demonstrated high expression of MRP1 (multi-drug resistance protein 1) in glioma. MRP1 expression was decreased by BMI1 siRNA and Shh-Gli1 cell signaling specific inhibitor GANT61 in our experiments. GANT61 very efficiently inhibited cell colony growth in glioma cell lines, compared to temozolomide. Moreover, a synergic effect of GANT61 and temozolomide drastically decreased the LD50 of temozolomide in the cell colony experiments. Therefore, our results suggest that there is a potential nexus of Shh-Gli1-BMI1 cell signaling to regulate MRP1 and to promote chemoresistance in glioma."

According to the news reporters, the research concluded: "Henceforth, our study opens the possibility of facing new targets, Gli1 and BMI1, for the effective treatment of glioma suppression of chemoresistance with adjuvant therapy of GANT61 and temozolomide."

Our news journalists report that additional information may be obtained by contacting M.H. Shahi, Aligarh Muslim University, Fac Med, Interdisciplinary Brain Res Center, Aligarh 202002, UP, India. Additional authors for this research include S. Farheen, M.P.M. Mariyath and J.S. Castresana.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s13277-016-5365-7. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Aligarh, India, Asia, Temozolomide
Dermatology - Cosmetic Dermatology

Study Findings from Autonomous University Broaden Understanding of Cosmetic Dermatology (Relationship between transient receptor potential vanilloid-1 expression and the intensity of sensitive skin symptoms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Dermatology - Cosmetic Dermatology have been published. According to news reporting originating from San Luis Potosi, Mexico, by NewsRx correspondents, research stated, "Sensitive skin (SS) is a hyper-reactive condition of the skin secondary to external factors, without objective signs of lesion. Its pathogenesis is still under investigation."

Our news editors obtained a quote from the research from Autonomous University, "Transient receptor potential vanilloid-1 (TRPV1) is a cation channel that responds to low pH and is related to nociception, neurogenic inflammation, and pruritus. To determine the expression of TRPV1 in subjects with SS and correlate it with the degree of symptoms and skin pigmentation. We included 31 subjects self-diagnosed as having SS. Colorimetric values were obtained for assessment of skin phototype, and the lactic acid stinging test (LAST) was performed. Two skin biopsies from the nasolabial fold of each volunteer were obtained. Qualitative analysis of TRPV1 was carried out with immunohistochemistry. Quantitative analysis of TRPV1 was carried out with qRT-PCR. LAST was positive in 74% of the subjects, 56% of those having tan and brown skin. Immunohistochemistry staining for TRPV1 was greater in positive subjects (P = 0.03), but showed no correlation with the intensity of symptoms. Positive subjects also had higher TRPV1 mRNA expression compared to negative subjects (P < 0.001). This expression showed a positive correlation with the intensity of referred symptoms (R = 0.75, P < 0.001) and skin pigmentation (R = 0.63, P < 0.001). TRPV1 expression is upregulated in subjects with sensitive skin, and it correlates with the intensity of the symptoms."

According to the news editors, the research concluded: "Our findings suggest a role for this receptor in the pathogenesis of sensitive skin syndrome."

The news editors report that additional information may be obtained by contacting J.P. Castanedo-Cazares, Univ Autonoma San Luis Potosi, Hosp Cent Dr Ignacio Morones Prieto, Dept. of Dermatol, San Luis Potosi, Mexico. Additional authors for this research include B. Torres-Alvarez, D. Cortes-Garcia, D. Hernandez-Blanco, C. Fuentes-Ahumada and J.P. Castanedo-Cazares.
Immunology - Immunoglobulins

Study Findings from B. Liu et al Provide New Insights into Immunoglobulins [A Novel Fusion of ALT-803 (Interleukin (IL)-15 Superagonist) with an Antibody Demonstrates Antigen-specific Antitumor Responses]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immunology - Immunoglobulins. According to news reporting originating from Miramar, Florida, by NewsRx correspondents, research stated, "IL-15 and its receptor (IL-15R) are co-expressed on antigen-presenting cells, allowing transpresentation of IL-15 to immune cells bearing IL-2R(C) and stimulation of effector immune responses. We reported previously that the high-affinity interactions between an IL-15 superagonist (IL-15N72D) and the extracellular IL-15R sushi domain (IL-15RSu) could be exploited to create a functional scaffold for the design of multivalent disease-targeted complexes."

Financial support for this research came from National Institutes of Health.

Our news editors obtained a quote from the research, "The IL-15N72DIL-15RSuFc complex, also known as ALT-803, is a multimeric complex constructed by fusing IL-15N72DIL-15RSu to the Fc domain of IgG1. ALT-803 is an IL-15 superagonist complex that has been developed as a potent antitumor immunotherapeutic agent and is in clinical trials."

According to the news editors, the research concluded: "Here we describe the creation of a novel fusion molecule, 2B8T2M, using the ALT-803 scaffold fused to four single chains of the tumor-targeting monoclonal antibody rituximab."

The news editors report that additional information may be obtained by contacting H.C. Wong, Altor BioSci Corp, Miramar, FL 33025, United States. Additional authors for this research include L. Kong, K.P. Han, H. Hong, W.D. Marcus, X.Y. Chen, E.K. Jeng, S. Alter, X.Y. Zhu, M.P. Rubinstein, S.X. Shi, P.R. Rhode, W.B. Cai and H.C. Wong.

Study Findings from Baylor University College of Medicine Provide New Insights into Clinical Trials and Studies (Pilot study of chronic maternal hyperoxygenation and effect on aortic and mitral valve annular dimensions in fetuses with left)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "Acute maternal hyperoxygenation (AMH) results in increased fetal left heart blood flow. Our aim was to perform a pilot study to determine the safety, feasibility and direction and magnitude of effect of chronic maternal hyperoxygenation (CMH) on mitral and aortic valve annular dimensions in fetuses with left heart hypoplasia (LHH) after CMH."

The news correspondents obtained a quote from the research from the Baylor University College of Medicine, "Gravidae with fetal LHH were eligible for inclusion in a prospective evaluation of CMH. LHH was defined as: sum of aortic and mitral valve annuli Z-scores <-4.5, arch flow reversal and left-to-right or bidirectional atrial level shunting without hypoplastic left heart syndrome or severe aortic stenosis. Gravidae with an affected fetus and with >= 10% increase in aortic/combined cardiac output flow after 10 min of AMH at 8L/min 100% fraction of inspired oxygen were offered enrollment. Nine gravidae were enrolled from February 2014 to January 2015. The goal therapy was >= 8 h daily CMH from enrollment until delivery. Gravidae who were cared for from July 2012 to October 2014 with fetal LHH and no CMH were identified as historical controls (n=9). Rates of growth in aortic and mitral annuli over the final trimester were compared between groups using longitudinal regression. There were no significant maternal or fetal complications in the CMH cohort. Mean gestational age at study initiation was 29.6 +/- 3.2weeks for the intervention group and 28.4 +/- 1.8weeks for controls (P=0.35). Mean relative increase in aortic/combined cardiac output after AMH was 35.3% (range, 18.1-47.9%). Median number of hours per day on CMH therapy was 9.3 (range, 6.5-14.6) and median duration of CMH was 48 (range, 33-84) days. Mean mitral annular growth was 0.19 +/- 0.05 mm/week compared with 0.14 +/- 0.03 mm/week in CMH vs controls (mean difference 0.05 +/- 0.03 mm/week, P=0.33). Mean aortic annular growth was 0.14 +/- 0.03 mm/week compared with 0.13 +/- 0.03 mm/week in CMH vs controls (mean difference 0.01 +/- 0.03 mm/week, P=0.75). More than 9 h CMH daily (n=6) was associated with better growth of the aortic annulus in intervention fetuses (0.16 +/- 0.03 vs 0.08 +/- 0.02 mm/week, P=0.014). CMH is both safe and feasible for continued research."

According to the news reporters, the research concluded: "In this pilot study, the effect estimates of annular growth, using the studied method of delivery and dose of oxygen, were small."

For more information on this research see: Pilot study of chronic maternal hyperoxygenation and effect on aortic and mitral valve annular dimensions in fetuses with left heart hypoplasia. Ultrasound in Obstetrics & Gynecology, 2016;48(3):365-372. Ultrasound in Obstetrics & Gynecology
Drugs and Therapies - Niclosamide Therapy

Study Findings from Beckman Institute for Advanced Science and Technology Provide New Insights into Niclosamide Therapy (Defined Host-Guest Chemistry on Nanocarbon for Sustained Inhibition of Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Niclosamide Therapy. According to news originating from Urbana, Illinois, by NewsRx correspondents, research stated, "Signal transducer and activator of transcription factor 3 (STAT-3) is known to be overexpressed in cancer stem cells. Poor solubility and variable drug absorption are linked to low bioavailability and decreased efficacy."

Financial support for this research came from University of Illinois at Urbana-Champaign and Children's Discovery Institute.

Our news journalists obtained a quote from the research from Beckman Institute for Advanced Science and Technology, "Many of the drugs regulating STAT-3 expression lack aqueous solubility; hence hindering efficient bioavailability. A theranostics nanoplatform based on luminescent carbon particles decorated with cucurbit[6]uril is introduced for enhancing the solubility of niclosamide, a STAT-3 inhibitor. The host-guest chemistry between cucurbit[6] uril and niclosamide makes the delivery of the hydrophobic drug feasible while carbon nanoparticles enhance cellular internalization. Extensive physicochemical characterizations confirm successful synthesis. Subsequently, the host-guest chemistry of niclosamide and cucurbit[6] uril is studied experimentally and computationally. In vitro assessments in human breast cancer cells indicate approximately twofold enhancement in IC50 of drug. Fourier transform infrared and fluorescence imaging demonstrate efficient cellular internalization. Furthermore, the catalytic biodegradation of the nanoplatforms occur upon exposure to human myeloperoxidase in short time. In vivo studies on athymic mice with MCF-7 xenograft indicate the size of tumor in the treatment group is half of the controls after 40 d. Immunohistochemistry corroborates the downregulation of STAT-3 phosphorylation."

According to the news editors, the research concluded: "Overall, the host-guest chemistry on nanocarbon acts as a novel arsenal for STAT-3 inhibition."

The news correspondents report that additional information may be obtained from D. Pan, Beckman Inst Adv Sci & Technol, Inst Sustainabil Energy & Environm, Dept. of Mat Sci & Engn, Urbana, IL 61801, United States. Additional authors for this research include S.K. Misra, P. Mukherjee, A. Ostadhossein, E. Daza, S. Tiwari, S. Mittal, M.C. Gryka, R. Bhargava and D. Pan.

Genetic Diseases and Conditions - Down Syndrome

Study Findings from California Department of Public Health Provide New Insights into Down Syndrome (Observed Rate of Down Syndrome in Twin Pregnancies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Genetic Diseases and Conditions - Down Syndrome are presented in a new report. According to news reporting out of Richmond, California, by NewsRx editors, research stated, "To evaluate the observed incidence of Down syndrome in twins compared with that expected based on maternal age-matched singletons, which is the current clinical approach. This was a retrospective review of California Prenatal Screening Program participants with expected delivery dates between July 1995 and December 2012."

Our news journalists obtained a quote from the research from the California Department of Public Health, "Cases confirmed prenatally or postnatally with a genetic imbalance leading to phenotypic Down syndrome (trisomy 21, mosaic trisomy 21, or translocations) were included. Pregnancies conceived with ovum donation and women older than 45 years were excluded. We compared the observed Down syndrome incidence per pregnancy for twins with expected incidence by extrapolating from singleton data and expected zygosity as is the current clinical approach. This extrapolation assumes that monozygotic pregnancies have equivalent Down syndrome risk per pregnancy relative to maternal age-matched singletons and dizygotic pregnancies have twice the risk of at least one affected fetus. Zygosity for affected cases was presumed to be monozygotic with Down syndrome concordance and dizygotic with Down syndrome discordance. Counts were compared using cumulative Poisson distributions. Of 77,279 twin pregnancies, 182 (0.2%) had at least one fetus with Down syndrome confirmed by karyotype. The ratio of observed-to-expected Down syndrome incidence per pregnancy was 33.6%, 75.2%, and 70.0% for monozygotic, dizygotic, and all twins, respectively (P <.001 for all comparisons). Considering maternal age subgroups and twin
zygosity, a significantly lower-than-expected Down syndrome incidence was seen for women aged 25 to 45 years with monozygotic pregnancies and overall for women aged 25 to 45 years with dizygotic pregnancies. The observed incidence of Down syndrome in twin pregnancies is lower than expected, most notably for monozygotic pregnancies and with increasing maternal age."

According to the news editors, the research concluded: "Risk-based counseling can strongly affect women's choices regarding testing and management during pregnancy, so an understanding of the true Down syndrome risk in twin gestations is crucial."

For more information on this research see: Observed Rate of Down Syndrome in Twin Pregnancies. Obstetrics and Gynecology, 2016;128(5):1127-1133. Obstetrics and Gynecology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Obstetrics and Gynecology - journals.lww.com/greenjournal/pages/default.aspx)

Our news journalists report that additional information may be obtained by contacting T.N. Sparks, Calif Dept. of Public Hlth, Genet Dis Screening Program, Richmond, CA, United States. Additional authors for this research include M.E. Norton, M. Flessel, S. Goldman and R.J. Currier.

Shellfish Immunology

Study Findings from Cancer Research Institute Broaden Understanding of Shellfish Immunology [Identification and characteristic of three members of the Clq/TNF-related proteins (CTRPs) superfamily in Eudontomyzon morii]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Shellfish Immunology are discussed in a new report. According to news reporting from Dongguan, People's Republic of China, by NewsRx journalists, research stated, "Clq is the target recognition protein of the classical complement pathway and a major connecting, link between innate and acquired immunity. C1q and the multifunctional tumor necrosis factor (TNF) ligand family is of similar crystal structures, are designated the Clq/TNF-related proteins (CTRPs) superfamily."

The news correspondents obtained a quote from the research from Cancer Research Institute, "They are involved in processes as diverse as host defense, inflammation, apoptosis, autoimmunity, cell differentiation, organogenesis, hibernation and insulinresistant obesity. In this study, three members of the CTRPs superfamily were isolated and characterized in Yalu River lampreys (Eudontomyzon morii), and are respectively named LaClqC, LaCTRP1, LaCTRP9. The full-length cDNAs of ClqC-like (LaClqAL), CTRP1-like (LaCIRP1), and LIRP9-like (LaCTRP9) consist of 723, 762 and 825 bp of nucleotide sequence encoding
polypeptides of 241, 254 and 275 amino acids, respectively. All-three proteins share three common domains: a signal peptide at the N terminus, a collagenous domain (characteristic Gly-X-Y repeats), and a C-terminal globular domain."

According to the news reporters, the research concluded: "In addition, the higher expression level of the three proteins in heart by RT-PCR and real-time PCR tissue profiling implied that they might involve in immune response or injury repair of the heart in lamprey."

For more information on this research see: Identification and characteristic of three members of the Clq/TNF-related proteins (CTRP5) superfamily in Eudontomyzon morii. *Fish & Shellfish Immunology*, 2016;59():233-240. *Fish & Shellfish Immunology* can be contacted at: Academic Press Ltd- Elsevier Science Ltd, 24-28 Oval Rd, London NW1 7DX, England. **Drug Abuse**

**Study Findings from Catholic University of Leuven Broaden Understanding of Drug Abuse (A Bivariate Genetic Analysis of Drug Abuse Ascertained Through Medical and Criminal Registries in Swedish Twins, Siblings and Half-Siblings)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drug Abuse. According to news originating from Leuven, Belgium, by NewsRx correspondents, research stated, "Using Swedish nationwide registry data, the authors investigated the correlation of genetic and environmental risk factors in the etiology of drug abuse as ascertained from medical and criminal registries by modeling twin and sibling data. Medical drug abuse was defined using public inpatient and outpatient records, while criminal drug abuse was ascertained through legal records."

Financial supporters for this research include National Institute on Drug Abuse (US), National Institute on Drug Abuse, NIDA.

Our news journalists obtained a quote from the research from the Catholic University of Leuven, "Twin, full and half sibling pairs were obtained from the national twin and genealogical registers. Information about sibling pair residence within the same household was obtained from Statistics Sweden. Standard bivariate genetic structural equation modeling was applied to the population-based data on drug abuse ascertained through medical and crime registries, using OpenMx. Analyses of all possible pairs of twins (MZ: N = 4482; DZ: N = 9838 pairs), full- (N = 1,278,086) and half-siblings (paternal: N = 7767; maternal N = 70,553) who grew up together suggested that factors explaining familial resemblance for drug abuse as defined through medical or criminal registries were mostly the same. Results showed substantial heritability and moderate contributions of shared environmental factors to drug abuse; both were
higher in males versus females, and higher for drug abuse ascertained through criminal than medical records. Because of the low prevalence of both assessments of drug abuse, having access to population data was crucial to obtain stable estimates. Using objective registry data, the authors found that drug abuse—whether ascertained through medical versus criminal records—was highly heritable. Furthermore, shared environmental factors contributed significantly to the liability of drug abuse."

According to the news editors, the research concluded: "Genetic and shared environmental risk factors for these two forms of drug abuse were highly correlated."

For more information on this research see: A Bivariate Genetic Analysis of Drug Abuse Ascertained Through Medical and Criminal Registries in Swedish Twins, Siblings and Half-Siblings. Behavior Genetics, 2016;46(6):735-741. Behavior Genetics can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Behavior Genetics - www.springerlink.com/content/0001-8244/)

The news correspondents report that additional information may be obtained from H.H. Maes, Catholic University of Leuven, Dept. of Kinesiol, Leuven, Belgium. Cardiovascular Diseases and Conditions - ...

Study Findings from Center for Disease Control and Prevention Provide New Insights into Hypertension (Improved Blood Pressure Control to Reduce Cardiovascular Disease Morbidity and Mortality: The Standardized Hypertension Treatment and ...

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Hypertension is now available. According to news reporting from Atlanta, Georgia, by NewsRx journalists, research stated, "Hypertension is the leading remediable risk factor for cardiovascular disease, affecting more than 1 billion people worldwide, and is responsible for more than 10 million preventable deaths globally each year. While hypertension can be successfully diagnosed and treated, only one in seven persons with hypertension have controlled blood pressure."

The news correspondents obtained a quote from the research from Center for Disease Control and Prevention, "To meet the challenge of improving the control of hypertension, particularly in low- and middle-income countries, the authors developed the Standardized Hypertension Treatment and Prevention Project, which involves a health systems-strengthening approach that advocates for standardized hypertension management using evidence-based interventions. These interventions include the use of standardized treatment protocols, a core set of medications along with improved procurement mechanisms to increase the availability and
affordability of these medications, registries for cohort monitoring and evaluation, patient empowerment, team-based care (task shifting), and community engagement."

According to the news reporters, the research concluded: "With political will and strong partnerships, this approach provides the groundwork to reduce high blood pressure and cardiovascular disease-related morbidity and mortality."

Our news journalists report that additional information may be obtained by contacting P. Patel, Center Dis Control & Prevent, Atlanta, GA 30329, United States. Additional authors for this research include P. Ordunez, D. DiPette, M.C. Escobar, T. Hassell, F. Wyss, A. Hennis, S. Asma and S. Angell.

**Embryo Transfer**

**Study Findings from Chaim Sheba Medical Center Provide New Insights into Embryo Transfer (Clinical pregnancy rate following frozen embryo transfer is higher with blastocysts vitrified on day 5 than on day 6)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Embryo Transfer. According to news reporting out of Ramat Gan, Israel, by NewsRx editors, research stated, "The aim of this study was to compare the pregnancy rates between good quality blastocysts vitrified on day 6 versus blastocysts vitrified on day 5 after fertilization. This is a retrospective cohort study of 791 freeze-thaw cycles of blastocysts vitrified either on day 5 or on day 6 and transferred between January 2012 and October 2015."

Our news journalists obtained a quote from the research from Chaim Sheba Medical Center, "Five hundred and thirty-seven cycles included blastocysts vitrified on day 5, and 254 cycles included blastocysts vitrified on day 6. The age of the patients and the proportion of embryos that survived the thawing process were comparable between the two groups. More good quality embryos were transferred in the group in which blastocysts were vitrified on day 6 (1.2 vs. 1.3, p = 0.005), but the clinical pregnancy rate (44 vs. 33 %, p = 0.002) and the ongoing pregnancy rate (41 vs. 28 %, p < 0.001) were higher in the group in which blastocysts were vitrified on day 5. Multivariate regression analysis adjusting for patient's age, number of good quality embryos transferred (ae <yen >3BB), and treatment protocol demonstrated that the day 6 vitrified group had a significantly lower clinical pregnancy rate compared to the day 5 vitrified
group (OR 0.54, 95 % CI 0.38-0.76)."

According to the news editors, the research concluded: "The clinical pregnancy rate following frozen embryo transfer is significantly lower with blastocysts vitrified on day 6 compared to blastocysts vitrified on day 5."

For more information on this research see: Clinical pregnancy rate following frozen embryo transfer is higher with blastocysts vitrified on day 5 than on day 6. Journal of Assisted Reproduction and Genetics, 2016;33(12):1553-1557. Oncology - Pancreatic Cancer

Study Findings from Charles University Broaden Understanding of Pancreatic Cancer (Early detection of pancreatic cancer: impact of high-resolution imaging methods and biomarkers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Pancreatic Cancer. According to news reporting originating from Prague, Czech Republic, by NewsRx correspondents, research stated, "High-resolution imaging methods (HRIMs) and biomarkers present the second step of pancreatic cancer (PC) diagnostics in at-risk individuals. These include patients with positive risk factors, early symptoms, nonresponders to the initial antidiabetic therapy, patients older than 50 years of age with new-onset unstable diabetes requiring insulin as well as patients with long-term insulin-non-dependent diabetes and recent (up to 6 months) failure of antidiabetic therapy."

Our news editors obtained a quote from the research from Charles University, "The procedures should be started without delay and the co-operation between the primary and tertiary medical centers is highly desirable. An early indication of HRIMs and biomarkers is a prerequisite for the diagnosis of a resectable PC."

According to the news editors, the research concluded: "This publication reviews the recent contribution of HRIMs and biomarkers toward an early diagnosis of PC."

For more information on this research see: Early detection of pancreatic cancer: impact of high-resolution imaging methods and biomarkers. European Journal of Gastroenterology & Hepatology, 2016;28(12):e33-e43. European Journal of Gastroenterology & Hepatology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001
Cytoplasmic Structures

**Study Findings from China Pharmaceutical University Broaden Understanding of Cytoplasmic Structures (Triptolide disrupts the actin-based Sertoli-germ cells adherens junctions by inhibiting Rho GTPases expression)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cytoplasmic Structures. According to news reporting out of Jiangsu, People's Republic of China, by NewsRx editors, research stated, "Triptolide (TP), derived from the medicinal plant Triterygium wilfordii Hook. f. (TWHF), is a diterpene triepoxide with variety biological and pharmacological activities. However, TP has been restricted in clinical application due to its narrow therapeutic window especially in reproductive system."

Financial supporters for this research include Major Scientific and Technological Special Project for Significant New Drugs Creation, National Natural Science Foundation of China, Fundamental Research Funds for the Central Universities, 333 High Level Project of Jiangsu Province, Project Program of Jiangsu Key Laboratory of Drug Screening.

Our news journalists obtained a quote from the research from China Pharmaceutical University, "During spermatogenesis, Sertoli cell cytoskeleton plays an essential role in facilitating germ cell movement and cell-cell actin-based adherens junctions (AJ). At Sertoli cell-spermatid interface, the anchoring device is a kind of AJ, known as ectoplasmic specializations (ES). In this study, we demonstrate that beta-actin, an important component of cytoskeleton, has been significantly down-regulated after TP treatment TP can inhibit the expression of Rho GTPase such as, RhoA, RhoB, Cdc42 and Rack. Downstream of Rho GTPase, Rho-associated protein kinase (ROCKS) gene expressions were also suppressed by TP. F-actin immunofluorescence proved that TP disrupts Sertoli cells cytoskeleton network. As a result of beta-actin down-regulation, TP treatment increased expression of testin, which indicating ES has been disassembled."

According to the news editors, the research concluded: "In summary, this report illustrates that TP induces cytoskeleton dysfunction and disrupts cell cell adherens junctions via inhibition of Rho GTPases."

For more information on this research see: Triptolide disrupts the actin-based

Our news journalists report that additional information may be obtained by contacting L.Y. Zhang, China Pharmaceutical University, State Key Lab Nat Med, Nanjing 210009, Jiangsu, People's Republic of China. Additional authors for this research include F. Zhao, Z.M. Lv, W.Q. Shi, L.Y. Zhang and M. Yan.

**Silicon Dioxide**

**Study Findings from Chinese Academy of Sciences Provide New Insights into Silicon Dioxide [Treatment of groundwater containing Mn (II), Fe(II), As(III) and Sb(III) by bioaugmented quartz-sand filters]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Silicon Dioxide is the subject of a report. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "High concentrations of iron (Fe(II)) and manganese (Mn(II)) often occur simultaneously in groundwater. Previously, we demonstrated that Fe(II) and Mn(II) could be oxidized to biogenic Fe-Mn oxides (BFMO) via aeration and microbial oxidation, and the formed BFMO could further oxidize and adsorb other pollutants (e.g., arsenic (As(III)) and antimony (Sb(III)))."

Funders for this research include National Natural Science Foundation of China, National Water Pollution Control and Treatment Science and Technology.

Our news journalists obtained a quote from the research from the Chinese Academy of Sciences, "To apply this finding to groundwater remediation, we established four quartz-sand columns for treating groundwater containing Fe(II), Mn(II), As(III), and Sb(III). A Mn-oxidizing bacterium (Pseudomonas sp. QJX-1) was inoculated into two parallel bioaugmented columns. Long-term treatment (120 d) showed that bioaugmentation accelerated the formation of Fe-Mn oxides, resulting in an increase in As and Sb removal. The bioaugmented columns also exhibited higher overall treatment effect and anti-shock load capacity than that of the non-bioaugmented columns. To clarify the causal relationship between the microbial community and treatment effect, we compared the biomass of active bacteria (reverse-transcribed real-time PCR), bacterial community composition (Miseq 16S rRNA sequencing) and community function (metagenomic sequencing) between the bioaugmented and non-bioaugmented columns. Results indicated that the QJX1 strain grew steadily and attached onto the filter material surface in the bioaugmented columns. In general, the inoculated strain did not significantly alter the
composition of the indigenous bacterial community, but did improve the relative abundances of xenobiotic metabolism genes and Mn oxidation gene."

According to the news editors, the research concluded: "Thus, bioaugmentation intensified microbial degradation/utilization for the direct removal of pollutants and increased the formation of Fe-Mn oxides for the indirect removal of pollutants."

For more information on this research see: Treatment of groundwater containing Mn (II), Fe(II), As(III) and Sb(III) by bioaugmented quartz-sand filters. *Water Research*, 2016;106 ():126-134. *Water Research* can be contacted at: Pergamon-Elsevier Science Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, England. **Bone Research**

**Study Findings from Chinese University of Hong Kong Provide New Insights into Bone Research (Osthole Promotes Endochondral Ossification and Accelerates Fracture Healing in Mice)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Bone Research are presented in a new report. According to news originating from Hong Kong, People's Republic of China, by NewsRx correspondents, research stated, "Osthole has been found to restore bone mass in preclinical osteoporotic models. In the present study, we investigated the effects of osthole on bone fracture repair in mice."

Our news journalists obtained a quote from the research from the Chinese University of Hong Kong, "Adult C57BL/6 mice were subjected to transverse femoral fractures and administrated orally with 20 mg/kg osthole and vehicle solvent daily from week 1 post-operation. Fracture callus were analyzed by plain radiography, micro-computed tomography, histology, molecular imaging and immunohistochemistry and tartrate-resistant acid phosphatase staining. Results demonstrated that osthole treatment enhanced removal of cartilage and bony union during reparative stage without significant interfering on remodeling process. In vivo molecular imaging showed bone formation rate of the treatment group was almost twofold of control group at week 2 post-operation. Osthole augmented the expression of alkaline phosphatase and collagen type X in hypertrophic chondrocytes as well as expression of bone morphogenetic protein-2, osteocalcin and alkaline phosphatase in osteoblastic cells, indicating it promoted mineralization of hypertrophic cartilage and woven bone growth simultaneously during endochondral healing."
According to the news editors, the research concluded: "In summary, osthole promotes endochondral ossification via upregulation of maturation osteogenic marker genes in chondrocytes and subsequently accelerates fracture repair and bony fusion."

For more information on this research see: Osthole Promotes Endochondral Ossification and Accelerates Fracture Healing in Mice. *Calcified Tissue International*, 2016;99 (6):649-660. *Calcified Tissue International* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. **Human Herpesvirus Diseases and Conditions -**

**Study Findings from Chonbuk National University Provide New Insights into Epstein-Barr Virus (Splenic infarction associated with acute infectious mononucleosis due to Epstein-Barr virus infection)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Human Herpesvirus Diseases and Conditions - Epstein-Barr Virus. According to news reporting from Jeonju, South Korea, by NewsRx journalists, research stated, "The purpose of this study was to report a case of a previously healthy 20-year-old woman diagnosed with splenic infarction following infectious mononucleosis (IM) by Epstein-Barr virus (EBV) infection and to perform the first systematic review of the clinical characteristics of splenic infarction associated with IM. A systematic review was conducted using English, French, and Japanese literatures of splenic infarction associated with IM due to EBV infection published between 1961 and 2015 in PubMed Medline."

The news correspondents obtained a quote from the research from Chonbuk National University, "A total of 19 cases were extracted from the collected articles. Left upper quadrant (LUQ) pain was observed in 15 (79%) patients. Splenectomy was performed in five (26%) cases, among which four patients presented with stable vital signs. Splenic rupture was accompanied in two (10%) patients. The median time from the onset of IM symptoms to the diagnosis of splenic infarction was 5 days (range, 1-25 days). Fourteen (74%) of 19 patients experienced improvement through medical treatment, and there were no deaths. Splenic infarction associated with IM due to EBV infection can show a favorable clinical outcome after medical treatment."

According to the news reporters, the research concluded: "Clinicians should consider the possibility of splenic infarction when patients with IM experience LUQ pain. J. Med. Virol. 89:332-336, 2017."

For more information on this research see: Splenic infarction associated with acute

Our news journalists report that additional information may be obtained by contacting J.H. Hwang, Chonbuk National University, Chonbuk Natl Univ Hosp, Res Inst Clin Med, Jeonju, South Korea. Additional authors for this research include D.Y. Baek, S.M. Oh, J.H. Hwang, C.S. Lee and J.H. Hwang.

**Cardiovascular Diseases and Conditions**

**Study Findings from Chung Ang University Broaden Understanding of Atherosclerosis (Relation of serum homocysteine levels to cerebral artery calcification and atherosclerosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Atherosclerosis are discussed in a new report. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Elevated serum homocysteine level is known to be associated with increased risk of vascular event due to endothelial senescence. We investigated the association between serum homocysteine level and cerebral arteriosclerosis status including intracranial vascular calcification and atherosclerosis burden."

The news correspondents obtained a quote from the research from Chung Ang University, "We identified 1193 consecutive patients (mean age = 68.6 +/- 12.7, 537 female patients) who were admitted with acute cerebral infarction or transient ischemic attack from a single university medical center. The patients were categorized into three groups according to their serum homocysteine level. Cerebral artery calcification was assessed from the cavernous portion of both internal carotid arteries, and cerebral atherosclerosis burden was derived as the sum of stenosis degree of major intracranial arteries from brain computed tomography angiography. The mean homocysteine level was 14.1 +/- 6.2 mu mol/ L, and intracranial cerebral artery calcification was present in 974 patients (81.6%), with 339 cases of advanced calcification (28.4%). The prevalence of cerebral artery calcification, advanced cerebral artery calcification and cerebral atherosclerosis burden showed increasing tendency throughout the homocysteine tertiles. Multivariable logistic regression analysis including age, sex, vascular risk factors, serum C-reactive protein, estimated glomerular filtration rate and homocysteine tertile disclosed that the highest serum homocysteine tertile was an independent predictor of advanced cerebral artery calcification (odds ratio = 1.45, confidence interval = 1.02-2.05) and advanced cerebral atherosclerosis (odds ratio = 1.42, confidence interval = 1.01-1.99) compared to the
lowest group. An elevated serum homocysteine level was independently associated with intracranial arterial calcification and atherosclerosis burden."

According to the news reporters, the research concluded: "Future studies are warranted to test whether lowering serum homocysteine can delay cerebral arteriosclerotic changes."

For more information on this research see: Relation of serum homocysteine levels to cerebral artery calcification and atherosclerosis. *Atherosclerosis*, 2016;254():200-204. *Atherosclerosis* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. **Nutritional and Metabolic Diseases and Conditions...**

**Study Findings from Deakin University Provide New Insights into Obesity (Whole of Systems Trial of Prevention Strategies for Childhood Obesity: WHO STOPS Childhood Obesity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting from Melbourne, Australia, by NewsRx journalists, research stated, "Community-based initiatives show promise for preventing childhood obesity. They are characterized by community leaders and members working together to address complex local drivers of energy balance."

The news correspondents obtained a quote from the research from Deakin University, "To present a protocol for a stepped wedge cluster randomized trial in ten communities in the Great South Coast Region of Victoria, Australia to test whether it is possible to: (1) strengthen community action for childhood obesity prevention, and (2) measure the impact of increased action on risk factors for childhood obesity. The WHO STOPS intervention involves a facilitated community engagement process that: creates an agreed systems map of childhood obesity causes for a community; identifies intervention opportunities through leveraging the dynamic aspects of the system; and, converts these understandings into community-built, systems-oriented action plans. Ten communities will be randomized (1:1) to intervention or control in year one and all communities will be included by year three. The primary outcome is childhood obesity prevalence among grade two (ages 7-8 y), grade four (9-10 y) and grade six (11-12 y) students measured using our established community-led..."
monitoring system (69% school and 93% student participation rate in government and independent schools). An additional group of 13 external communities from other regions of Victoria with no specific interventions will provide an external comparison. These communities will also allow us to assess diffusion of the intervention to control communities during the first three years of the trial."

According to the news reporters, the research concluded: "This trial will test effectiveness, over a five-year period, of community-owned, -supported and -led strategies designed to address complex and dynamic causes of childhood obesity."

Our news journalists report that additional information may be obtained by contacting S. Allender, Deakin University, Fac Hlth, World Hlth Organization Collaborating Center Obes Prevent, Global Obes Center GLOBE, Melbourne, Vic 3125, Australia. Additional authors for this research include L. Millar, P. Hovmand, C. Bell, M. Moodie, R. Carter, B. Swinburn, C. Strugnell, J. Lowe, K. de la Haye, L. Orellana and S. Morgan.

Genetics

Study Findings from Department of Biochemistry & Molecular Biology Broaden Understanding of Genetics (Immunomodulatory Function of the Tumor Suppressor p53 in Host Immune Response and the Tumor Microenvironment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Genetics are discussed in a new report. According to news reporting out of Augusta, Georgia, by NewsRx editors, research stated, "The tumor suppressor p53 is the most frequently mutated gene in human cancers. Most of the mutations are missense leading to loss of p53 function in inducing apoptosis and senescence."

Our news journalists obtained a quote from the research from the Department of Biochemistry & Molecular Biology, "In addition to these autonomous effects of p53 inactivation/dysfunction on tumorigenesis, compelling evidence suggests that p53 mutation/inactivation also leads to gain-of-function or activation of non-autonomous pathways, which either directly or indirectly promote tumorigenesis. Experimental and clinical results suggest that p53 dysfunction fuels pro-tumor inflammation and serves as an immunological gain-of-function driver of tumorigenesis via skewing immune landscape of the tumor microenvironment (TME). It is now increasingly appreciated that p53 dysfunction in various cellular compartments of the TME leads to immunosuppression and immune evasion. Although our understanding of the cellular and molecular processes that link p53 activity to host immune regulation is still incomplete, it is clear that activating/reactivating the p53 pathway in the TME..."
also represents a compelling immunological strategy to reverse immunosuppression and enhance antitumor immunity."

According to the news editors, the research concluded: "Here, we review our current understanding of the potential cellular and molecular mechanisms by which p53 participates in immune regulation and discuss how targeting the p53 pathway can be exploited to alter the immunological landscape of tumors for maximizing therapeutic outcome."

For more information on this research see: Immunomodulatory Function of the Tumor Suppressor p53 in Host Immune Response and the Tumor Microenvironment. *International Journal of Molecular Sciences*, 2016;17(11):2522-2537. *International Journal of Molecular Sciences* can be contacted at: MdpI Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

**Mycobacterium Infections - Latent Tuberculosis**

**Study Findings from Department of Respiratory Medicine Provide New Insights into Latent Tuberculosis (Baseline abnormal liver function tests are more important than age in the development of isoniazid-induced hepatotoxicity for patients receiving …)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Mycobacterium Infections - Latent Tuberculosis. According to news originating from Sydney, Australia, by NewsRx correspondents, research stated, "One of the cornerstones of Australia's public health programmes to eliminate tuberculosis (TB) is the identification and treatment of latent tuberculosis infection (LTBI). The main aim of this study is to determine the demographics, compliance, completion rates and adverse events of patients on preventive therapy (PT) for LTBI at our institution."

Our news journalists obtained a quote from the research from the Department of Respiratory Medicine, "The secondary aim is to determine the rates of isoniazid (INH) hepatotoxicity and identify any contributory factors. The method used was an audit using medical records of 100 consecutive patients (2010-2014) treated with PT for LTBI. Seventy-two patients with confirmed LTBI started 9 months of INH and 22 started 4 months of rifampicin (rifampicin). The median age was 30 years. Half the patients were born in high TB-prevalence countries. Fifty-six per cent were contacts of index cases with confirmed TB, and 26% were pre-immunosuppression. Seventy-seven per cent completed PT with adequate compliance. Thirty-three per cent on INH and 23% on RIF experienced some liver function test (LFT) abnormality while on treatment. INH was ceased in 3% due to asymptomatic hepatic dysfunction (transaminases >5x upper limit of normal). No patients had permanent liver damage. Significant risk factors for liver dysfunction during PT were risk factors for liver disease (ch(3)(2)=8.7; p=
0.03) or abnormal pre-therapy LFT (ch(3)(2)=22.4; p<0.001). No patients developed active TB. The completion rate of 77% and rate of INH-induced hepatic dysfunction of 3% is comparable with the literature. We found no age association with the risk of INH-induced hepatic dysfunction; however, there was a significant and linear association with the degree of liver function abnormality during INH therapy and the presence of abnormal baseline LFT."

According to the news editors, the research concluded: "Routine LFT monitoring allowed early cessation of INH in those with significant but asymptomatic hepatitis who did not meet criteria for ATS/CDC LFT monitoring."

For more information on this research see: Baseline abnormal liver function tests are more important than age in the development of isoniazid-induced hepatotoxicity for patients receiving preventive therapy for latent tuberculosis infection. Internal Medicine Journal, 2016;46(3):281-7. (Wiley-Blackwell - www.wiley.com/: Internal Medicine Journal - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1445-5994)

Oncology - Lung Cancer

Study Findings from Department of Thoracic Surgery Broaden Understanding of Lung Cancer (Video-assisted thoracoscopic lobectomy for elderly nonsmall cell lung cancer: Short-term and long-term outcomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Lung cancer is the leading cause of cancer-related death worldwide, and the number of elderly patients with nonsmall-cell lung cancer (NSCLC) has risen with increasing life-expectancy. To evaluate safety and efficacy of thoracoscopic lobectomy for NSCLC patients above 75 years old."

The news reporters obtained a quote from the research from the Department of Thoracic Surgery, "We reviewed the data of 795 consecutive patients with NSCLC, who underwent video-assisted thoracoscopic lobectomy from January 2006 to December 2013. Patients were divided into two groups: The elderly group aged at least 75 years old (n=54), the contrast group aged <75 years old (n=741). The general characteristic, comorbidity, intraoperative observations, complications, operative mortality and long-term survival were compared between the two groups. The elderly group had a higher incidence of squamous cell
carcinoma (40.74% vs. 29.69%) and a lower incidence of adenocarcinoma (37.04% vs. 52.63%) than the contrast group (p=0.083). The ratio of smoking (61.11% vs. 41.97%), preoperative comorbidities (62.96% vs. 38.06%), perioperative blood transfusion (25.93% vs. 13.50%) and thoracic intubation indwelling time (10.3 vs. 8.2 days) in the elderly group were higher (p <0.01). There was no significant difference in duration of surgery (222.9 vs. 226.6 min), intraoperative blood loss (299.8 vs. 253.5 min), hospital stay (18.2 vs. 15.8 days) or postoperative hospital stay (10.3 vs. 8.4 days) between the two groups. Postoperative morbidities occurred more frequently in the elderly group than the contrast group (24.07% vs. 12.01%, p=0.018). Thirty-day mortality rate of two groups showed no significant difference (1.85% vs. 0.40%, p=0.246). The overall survival and recurrence-free survival in the elderly group were comparable with the contrast group (p=0.114 and 0.092, respectively).

According to the news reporters, the research concluded: "Video-assisted thoracoscopic lobectomy is a safe and reliable approach with acceptable short-and long-term outcome in the elderly."

Our news correspondents report that additional information may be obtained by contacting D. Liu, Dept. of Thoracic Surgery, China-Japan Friendship Hospital, Beijing, People's Republic of China. Additional authors for this research include C. Liang, Y. Guo, B. Shi, Y. Tian, Z. Song and D. Liu.

Macrolides

Study Findings from Emory University Broaden Understanding of Macrolides (Phosphatase inhibition increases AQP2 accumulation in the rat IMCD apical plasma membrane)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Macrolides have been published. According to news reporting from Atlanta, Georgia, by NewsRx journalists, research stated, "Vasopressin triggers the phosphorylation and apical plasma membrane accumulation of aquaporin 2 (AQP2), and it plays an essential role in urine concentration. Vasopressin, acting through protein kinase A, phosphorylates AQP2."

The news correspondents obtained a quote from the research from Emory University, "However, the phosphorylation state of AQP2 could also be affected by the action of protein phosphatases (PPs). Rat inner medullas (IM) were incubated with calyculin (PP1 and PP2A inhibitor, 50 nM) or tacrolimus (PP2B inhibitor, 100 nM). Calyculin did not affect total AQP2 protein abundance (by Western blot) but did significantly increase the abundances of pS256-
AQP2 and pS264-AQP2. It did not change pS261-AQP2 or pS269-AQP2. Calyculin significantly enhanced the membrane accumulation (by biotinylation) of total AQP2, pS256-AQP2, and pS264-AQP2. Likewise, immunohistochemistry showed an increase in the apical plasma membrane association of pS256-AQP2 and pS264-AQP2 in calyculin-treated rat IM. Tacrolimus also did not change total AQP2 abundance but significantly increased the abundances of pS261-AQP2 and pS264-AQP2. In contrast to calyculin, tacrolimus did not change the amount of total AQP2 in the plasma membrane (by biotinylation and immunohistochemistry). Tacrolimus did increase the expression of pS264-AQP2 in the apical plasma membrane (by immunohistochemistry).

According to the news reporters, the research concluded: "PP1/PP2A regulates the phosphorylation and apical plasma membrane accumulation of AQP2 differently than PP2B. Serine-264 of AQP2 is a phosphorylation site that is regulated by both PP1/PP2A and PP2B. This dual regulatory pathway may suggest a previously unappreciated role for multiple phosphatases in the regulation of urine concentration."

Our news journalists report that additional information may be obtained by contacting J.D. Klein, Emory University, Sch Med, Dept. of Physiol, Atlanta, GA 30322, United States. Additional authors for this research include B.X. Yang, J.A. Ruiz, O. Efe, T.O. Ilori, J.M. Sands and J.D. Klein.

Drugs and Therapies - Antifungals

Study Findings from Faculty of Pharmaceutical Sciences Provide New Insights into Antifungals (Activation of p38 Mitogen-Activated Protein Kinase by Clotrimazole Induces Multidrug Resistance-Associated Protein 3 Activation through a Novel ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antifungals is the subject of a report. According to news reporting originating in Miyagi, Japan, by NewsRx journalists, research stated, "Multidrug resistance-associated protein 3 (MRP3) is a basolaterally localized transporter in the liver and contributes to the transport of various metabolites such as conjugates of endogenous compounds and drugs from hepatocytes. MRP3 expression in the human liver is low under normal physiologic conditions but is induced by drug treatment."

The news reporters obtained a quote from the research from the Faculty of Pharmaceutical Sciences, "Although several studies have identified a region necessary for the basal transcription of MRP3, no region that responds to drugs has been reported. To identify the xenobiotic-responsive elements of MRP3, we constructed a luciferase reporter plasmid containing the MRP3 5’-flanking region up to 210 kb upstream from the transcription start site.
Among typical nuclear receptor ligands, clotrimazole dramatically enhanced MRP3 reporter activity in HepG2 cells, whereas rifampicin had no effect. We then conducted MRP3 reporter assays with deletion or mutation constructs to identify a clotrimazole-responsive element. The element was located approximately 26.8 kb upstream from the MRP3 transcription start site. Overexpression of the pregnane X receptor did not enhance clotrimazole-mediated transcription. We found that clotrimazole was toxic to HepG2 cells and we therefore investigated whether mitogen-activated protein kinase (MAPK) activation is involved in the transactivation of MRP3 by clotrimazole. p38 MAPK inhibitor SB203580 [4-(4-fluorophenyl)-2-(4-methylsulfinylphenyl)-5-(4-pyridyl)-1H-imidazole] suppressed MRP3 mRNA expression induced by clotrimazole, whereas c-Jun N-terminal kinase inhibitor SP600125 (1,9pyrazolooanthrone) and extracellular signal-regulated kinase inhibitor PD98059 [2-(2-amino-3-methoxyphenyl)-4H-1-benzopyran-4-one] did not. Phosphorylated p38 MAPK was detected in HepG2 cells treated with clotrimazole.

According to the news reporters, the research concluded: "These results suggest that activation of the p38 MAPK pathway induces the transcriptional activation of MRP3."

Study Findings from Federal University Provide New Insights into Bariatric Surgery (The FKBP5 polymorphism rs1360780 is associated with lower weight loss after bariatric surgery: 26 months of follow-up)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
Researchers detail new data in Surgery - Bariatric Surgery. According to news reporting originating from Porto Alegre, Brazil, by NewsRx correspondents, research stated, "Bariatric surgery is the most effective treatment choice for severe obesity. Recent literature indicates that FK506-binding protein 51 (FKBP51) could play a role in energy homeostasis, influencing adipogenesis and weight."

Our news editors obtained a quote from the research from Federal University, "To evaluate if the presence of the T allele of the FKBP5 SNP rs1360780, associated with increased FKBP51 expression, could influence weight loss after bariatric surgery. Hospital de Clinicas de Porto Alegre, Brazil. Forty-two patients awaiting bariatric surgery were included, and the presence of the FKBP5 rs1360780 polymorphism was evaluated. During the postoperative period, a 26-month follow-up of weight loss was performed (n = 42, 36, 35, 35, and 30, from the first to fifth postoperative evaluation, respectively; loss to follow-up: 28.6%). Carriers of the T allele presented significantly lower weight loss compared with patients with the C/C genotype after the 12th to 14th month follow-up period. Differences in weight loss between genotypes ranged from 14.2% to 19.9% of excess weight loss (P = .045 and .004, respectively) and from 7.6% to 9.0% of total weight loss (P = .002 for both comparisons). Furthermore, carriers of the T allele also presented an earlier cessation of weight loss after surgery. The presence of the T allele of the FKBP5 SNP rs1360780 was associated with weight loss after bariatric surgery."

According to the news editors, the research concluded: "Bariatric surgery can interact with genes involved in metabolic regulation, leading to different weight loss outcomes."

For more information on this research see: The FKBP5 polymorphism rs1360780 is associated with lower weight loss after bariatric surgery: 26 months of follow-up. Cardiovascular Diseases and Conditions --

Study Findings from Federal University Provide New Insights into Hypertension (Prognostic Importance of Ambulatory Blood Pressure Monitoring in Resistant Hypertension: Is It All that Matters?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Hypertension are presented in a new report. According to news reporting out of Rio de Janeiro, Brazil, by
NewsRx editors, research stated, "Purpose of Review This article reviews the current knowledge on the prognostic importance of ambulatory blood pressure (BP) monitoring parameters in patients with apparent treatment-resistant hypertension. Although mean 24-h ambulatory BPs have been consistently established as better cardiovascular risk predictors than clinic (office) BPs in several clinical settings, and ambulatory BP monitoring is generally indicated in patients with resistant hypertension; there were only five previous longitudinal prospective studies that specifically evaluated the prognostic importance of ambulatory BP monitoring parameters in resistant hypertensive patients."

Our news journalists obtained a quote from the research from Federal University, "These studies are carefully reviewed here. In conjunction, they demonstrated that office BP levels have little, if any, prognostic value in resistant hypertensive patients. Otherwise, several ambulatory BP monitoring parameters are strong cardiovascular risk predictors, particularly nighttime sleep BPs and the non-dipping pattern. Most relevant, the ambulatory BP monitoring diagnosis of true resistant hypertension (i.e., patients with uncontrolled ambulatory BPs, either daytime or nighttime) doubled the risk of future occurrence of major cardiovascular events in contrast to patients with white-coat resistant hypertension (i.e., with controlled ambulatory BPs despite uncontrolled office BPs)."

According to the news editors, the research concluded: "This review reinforces the pivotal role of serial ambulatory BP monitoring examinations in the clinical management of patients with resistant hypertension."

For more information on this research see: Prognostic Importance of Ambulatory Blood Pressure Monitoring in Resistant Hypertension: Is It All that Matters? Current Hypertension Reports, 2016;18(12):3-10. Current Hypertension Reports can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Study Findings from Fred Hutchinson Cancer Research Center Broaden Understanding of Obesity (Subjective mood and energy levels of healthy weight and overweight/obese healthy adults on high-and low-glycemic load experimental diets)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Obesity are presented in a new report. According to news reporting out of Seattle, Washington, by NewsRx editors, research stated, "Emerging evidence suggests a positive association of diet and obesity with depression. Researchers have examined several diet-mood hypotheses, including
investigating the extent to which carbohydrates may impact mood."

Financial support for this research came from NIH/NCI.

Our news journalists obtained a quote from the research from Fred Hutchinson Cancer Research Center, "There is limited research on how glycemic load, a characteristic of carbohydrates, impacts mood in healthy adults. Eighty-two healthy weight and overweight/obese, but otherwise healthy, adults enrolled in a randomized, crossover controlled feeding study testing low-compared to high-glycemic load diets. All participants completed self-report mood and energy level questionnaires during each arm of the intervention. Diets were isocaloric and were matched by macronutrient content as a percent of total energy. Mood was assessed with the Profile of Mood States (POMS) subscales; tension-anxiety, depression-dejection, anger-hostility, vigor-activity, fatigue-inertia, and confusion-bewilderment, total mood disturbance (TMD), and negative affect (NA) in addition to the Center for Epidemiological Studies - Depression (CES-D) scale at baseline and end of both 28-day feeding periods. Linear mixed models tested the intervention effect on mood, controlling for baseline POMS and CES-D scores, diet type, diet sequence, feeding period, sex, and percent body fat classification. The consumption of the high-glycemic load diet resulted in a 38% higher score for depressive symptoms on the CES-D (P = 0.002) compared to the low-glycemic load diet as well as 55% higher score for TMD (P = 0.05), and 26% higher score for fatigue/inertia (P = 0.04). In subgroup analyses, the overweight/obese participants had 40% higher scores on the CES-D scale compared to healthy weight participants (P = 0.05)."

According to the news editors, the research concluded: "A high-glycemic load diet was associated with higher depression symptoms, total mood disturbance, and fatigue compared to a low-glycemic load diet especially in overweight/obese, but otherwise healthy, adults."

Our news journalists report that additional information may be obtained by contacting K.L. Breymeyer, Fred Hutchinson Cane Res Center, Div Public Hlth Sci, Seattle, WA 98109, United States. Additional authors for this research include J.W. Lampe, B.A. McGregor and M.L. Neuhouser.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.appet.2016.08.008. This DOI is a link to an online electronic document that is either free or for purchase.

**Study Findings from Free University Broaden Understanding of Adrenal Cortical Steroids**

**Drugs and Therapies - Adrenal Cortical Steroids**

**Ethyl cellulose nanocarriers and nanocrystals differentially deliver dexamethasone into intact, tape-stripped or**

---
sodium lauryl sulfate-exposed ex vivo human ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Adrenal Cortical Steroids. According to news reporting from Berlin, Germany, by NewsRx journalists, research stated, "Understanding penetration not only in intact, but also in lesional skin with impaired skin barrier function is important, in order to explore the surplus value of nanoparticle-based drug delivery for anti-inflammatory dermatotherapy. Herein, short-term ex vivo cultures of (i) intact human skin, (ii) skin pretreated with tape-strippings and (iii) skin pre-exposed to sodium lauryl sulfate (SLS) were used to assess the penetration of dexamethasone (Dex)."

Financial support for this research came from Deutsche Forschungsgemeinschaft (DFG)/German Research Foundation.

The news correspondents obtained a quote from the research from Free University, "Intradermal microdialysis was utilized for up to 24 h after drug application as commercial cream, nanocrystals or ethyl cellulose nanocarriers applied at the therapeutic concentration of 0.05%, respectively. In addition, Dex was assessed in culture media and extracts from stratum corneum, epidermis and dermis after 24 h, and the results were compared to those in heat-separated split skin from studies in Franz diffusion cells. Providing fast drug release, nanocrystals significantly accelerated the penetration of Dex. In contrast to the application of cream and ethyl cellulose nanocarriers, Dex was already detectable in eluates after 6 h when applying nanocrystals on intact skin. Disruption of the skin barrier further accelerated and enhanced the penetration. Encapsulation in ethyl cellulose nanocarriers delayed Dex penetration. Interestingly, for all formulations highly increased concentrations in the dialysate were observed in tape-stripped skin, whereas the extent of enhancement was less in SLS-exposed skin. The results were confirmed in tissue extracts and were in line with the predictions made by in vitro release studies and ex vivo Franz diffusion cell experiments. The use of 45 kDa probes further enabled the collection of inflammatory cytokines. However, the estimation of glucocorticoid efficacy by Interleukin (IL)-6 and IL-8 analysis was limited due to the trauma induced by the probe insertion."

According to the news reporters, the research concluded: "Ex vivo intradermal microdialysis combined with culture media analysis provides an effective, skin-sparing method for preclinical assessment of novel drug delivery systems at therapeutic doses in models of diseased skin."

For more information on this research see: Ethyl cellulose nanocarriers and nanocrystals differentially deliver dexamethasone into intact, tape-stripped or sodium lauryl sulfate-exposed ex vivo human skin - assessment by intradermal microdialysis and extraction from the different skin layers. *Journal of Controlled Release*, 2016;242():25-34. *Journal of Controlled Release* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Study Findings from French National Institute of Health and Medical Research (INSERM) Broaden Understanding of Helicobacter pylori (Role of the N-Acetylmuramoyl-L-Alanyl Amidase, AmiA, of Helicobacter pylori in Peptidoglycan Metabolism, ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - Helicobacter pylori. According to news reporting out of Paris, France, by NewsRx editors, research stated, "The human gastric pathogen, Helicobacter pylori, is becoming increasingly resistant to most available antibiotics. Peptidoglycan (PG) metabolism is essential to eubacteria, hence, an excellent target for the development of new therapeutic strategies."

Our news journalists obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "However, our knowledge on PG metabolism in H. pylori remains poor. We have further characterized an isogenic mutant of the amiA gene encoding a N-acetylmuramoyl-L-alanyl amidase. The amiA mutant displayed long chains of unseparated cells, an impaired motility despite the presence of intact flagella and a tolerance to amoxicillin. Interestingly, the amiA mutant was impaired in colonizing the mouse stomach suggesting that AmiA is a valid target in H. pylori for the development of new antibiotics. Using reverse phase high-pressure liquid chromatography, we analyzed the PG muropeptide composition and glycan chain length distribution of strain 26695 and its amiA mutant. The analysis showed that H. pylori lacked muropeptides with a degree of cross-linking higher than dimeric muropeptides. The amiA mutant was also characterized by a decrease of muropeptides carrying 1,6-anhydro-N-acetylmuramic acid residues, which represent the ends of the glycan chains. This correlated with an increase of very long glycan strands in the amiA mutant. It is suggested that these longer glycan strands are trademarks of the division site."

According to the news editors, the research concluded: "Taken together, we show that the low redundancy on genes involved in PG maturation supports H. pylori as an attractive alternative model to study PG metabolism and cell shape regulation."

Our news journalists report that additional information may be obtained by contacting I.G. Boneca, INSEMR, Equipe Avenir, Paris, France. Additional authors for this research include C. Ecobichon, N. Pouradier, J.C. Rousselle, A. Namane and I.G. Boneca.

Dysostosis

Study Findings from French National Institute of Health and Medical Research (INSERM) Provide New Insights into Dysostosis (Mandibular Dysostosis without Microphthalmia Caused by OTX2 Deletion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Dysostosis. According to news originating from Nantes, France, by NewsRx correspondents, research stated, "Mutations in OTX2 are mostly identified in patients with anophthalmia/microphthalmia with variable severity. The OTX2 homeobox gene plays a crucial role in craniofacial morphogenesis during early embryo development."

Our news journalists obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "We report for the first time a patient with a mandibular dysostosis caused by a 120 kb deletion including the entire coding sequence of OTX2, identified by array CGH. No ocular malformations were identified after extended ophthalmologic examination."

According to the news editors, the research concluded: "Our data refine the clinical spectrum associated with OTX2 mutations and suggests that OTX2 haploinsufficiency should be considered as a possible cause for isolated mandibular dysostosis."

The news correspondents report that additional information may be obtained from B. Isidor, INSERM, Lab Physiopathol Resorpt Osseuse & Therapie Tumeu, Nantes, France. Additional authors for this research include S. Bordereau, A. Bleriot, O. Pichon, D. Poulain, A. Briand, C. Le Caignec and B. Isidor.

Obstructive Sleep Apnea

Study Findings from G. Ernst et al Provide New Insights into Obstructive Sleep Apnea [Difference between apnea-hypopnea index (AHI) and oxygen desaturation index (ODI): proportional increase associated with degree of obesity]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Obstructive Sleep Apnea. According to news reporting from Buenos Aires, Argentina, by NewsRx journalists, research stated, "Obesity is one of the main predisposing factors for obstructive sleep apnea (OSA) hypopnea syndrome. It has been described that body mass index (BMI) influences the accuracy of oxygen desaturation index (ODI) for the diagnosis of OSA by polysomnography (PSG)."

Financial support for this research came from No funding was received for this research.

The news correspondents obtained a quote from the research, "We analyzed the relationship between traditional indicators: apnea-hypopnea index (AHI) and ODI in a population at high risk for OSA, by respiratory polygraphy (RP) and PSG. This is a retrospective study of 1898 patients with suspicion of OSA, from which 1053 underwent RP and 582 underwent PSG with OSA. We compared results considering gender, age, and degree of obesity. This study included 1333 records of patients with OSA-more than 80 % of whom were overweight or obese. We observed that AHI and ODI increased progressively with obesity grade and said increase was associated with BMI only in men. The evaluation of the agreement between AHI and ODI found a difference between normal weight and obese patients, regardless of gender. Study findings contribute to understand the role of oximetry in the diagnosis of OSA in obese patients. Our results were observed using full PSG and a simplified home method."

According to the news reporters, the research concluded: "The correlation between these indicators could improve our clinical interpretation of OSA severity among obese patients when abbreviated tests are used."

For more information on this research see: Difference between apnea-hypopnea index (AHI) and oxygen desaturation index (ODI): proportional increase associated with degree of obesity. *Sleep and Breathing*, 2016;20(4):1175-1183. *Sleep and Breathing* can be contacted at: Springer Heidelberg, Tiergartenstrasse 17, D-69121 Heidelberg, Germany. **Mycobacterium Infections - Tuberculosis**

**Study Findings from Global Health Institute Provide New Insights into Tuberculosis (Characterization of DprE1-Mediated Benzothiazinone Resistance in Mycobacterium tuberculosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Mycobacterium Infections - Tuberculosis. According to news reporting originating from Lausanne, Switzerland, by NewsRx correspondents, research stated, "Benzothiazinones (BTZs) are a class of compounds found to be extremely potent against both drug-susceptible and drug-resistant Mycobacterium tuberculosis strains. The potency of BTZs is explained by their specificity for their target decaprenylphosphoryl-D-ribose oxidase (DprE1), in particular by covalent binding of the activated form of the compound to the critical cysteine 387 residue of the enzyme."

Our news editors obtained a quote from the research from Global Health Institute, "To probe the role of C387, we used promiscuous site-directed mutagenesis to introduce other codons at this position into dprE1 of M. tuberculosis. The resultant viable BTZ-resistant mutants were characterized in vitro, ex vivo, and biochemically to gain insight into the effects of these mutations on DprE1 function and on M. tuberculosis. Five different mutations (C387G, C387A, C387S, C387N, and C387T) conferred various levels of resistance to BTZ and exhibited different phenotypes. The C387G and C387N mutations resulted in a lower growth rate of the mycobacterium on solid medium, which could be attributed to the significant decrease in the catalytic efficiency of the DprE1 enzyme. All five mutations rendered the mycobacterium less cytotoxic to macrophages. Finally, differences in the potencies of covalent and noncovalent DprE1 inhibitors in the presence of C387 mutations were revealed by enzymatic assays. As expected from the mechanism of action, the covalent inhibitor PBTZ169 only partially inhibited the mutant DprE1 enzymes compared to the near-complete inhibition with a noncovalent DprE1 inhibitor, Ty38c."

According to the news editors, the research concluded: "This study emphasizes the importance of the C387 residue for DprE1 activity and for the killing action of covalent inhibitors such as BTZs and other recently identified nitroaromatic inhibitors."

The news editors report that additional information may be obtained by contacting S.T. Cole, Ecole Polytechnic Fed Lausanne, Global Hlth Inst, Lausanne, Switzerland. Additional authors for this research include B. Lechartier, G.S. Kolly, S. Boy-Rottger, J. Neres, J. Rybniker, A. Lupien, C. Sala, J. Piton and S.T. Cole.

Oncology - Pancreatic Cancer

Study Findings from Guangdong General Hospital Provide New Insights into Pancreatic Cancer (Association and Intragenic Single-Nucleotide Polymorphism Interactions of the XRCC1 Polymorphisms for Pancreatic Cancer Susceptibility)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Pancreatic Cancer are presented in a new report. According to news reporting originating from Guangzhou, People's Republic of China, by NewsRx correspondents, research stated, "X-ray repair cross-complementing group 1 (XRCC1) gene is an important candidate gene for influencing human cancer risks. This study examined the main and interactive effect of 9 single-nucleotide polymorphisms (SNPs) (Arg194Trp, Arg280His, Arg399Gln, c.1254C >T, c.1517G >C, c.1471G >A, C310T, 539del542, and T1915C) of XRCC1 in contribution to pancreatic cancer (PC)."

Our news editors obtained a quote from the research from Guangdong General Hospital, "A total of 298 PC patients and 298 healthy controls were enrolled. Selected SNPs in XRCC1 were genotyped. The generalized multifactor dimensionality reduction method investigated gene-gene interactions. Single-locus analyses showed that, in the codominant model, the G0 genotype of 539del542 might have a higher risk for PC (odds ratio [OR], 1.47; 95% confidence interval [95% CI], 1.05-2.08). For T1915C polymorphism, the TC and CC genotypes both had a higher risk for PC (OR, 1.76; 95% CI, 1.25-2.48; OR, 1.83; 95% CI, 1.05-3.19, respectively); and a similar result was observed in the dominant model (OR, 1.77; 95% CI, 1.28-2.46). A tendency of association between Arg280His and PC was also detected in the dominant model (OR, 0.70; 95% CI, 0.48-1.00). Furthermore, the generalized multifactor dimensionality reduction method showed that the 4-locus model was significant, involving Arg280His, 539del542, T1915C, and c.1517G >C (p <0.05)."

According to the news editors, the research concluded: "Thus, XRCC1 polymorphisms may contribute to the risk of PC independently or in an interactive manner."

For more information on this research see: Association and Intragenic Single-Nucleotide Polymorphism Interactions of the XRCC1 Polymorphisms for Pancreatic Cancer Susceptibility. Pancreas, 2016;45(4):546-51. (Lippincott Williams and Wilkins - www.lww.com; Pancreas - journals.lww.com/pancreasjournal/pages/default.aspx)

The news editors report that additional information may be obtained by contacting B.H. Hou, From the Dept. of General Surgery, Guangdong General Hospital, Guangdong Academy of Medical Sciences, Guangzhou, People's Republic of China. Additional authors for this research include Z.X. Jian, P. Cui, S.J. Li, R.Q. Tian and J.R Ou.

Study Findings from Harvard School of Medicine Provide New Insights into Oncology (Acquired Resistance to First-Line Afatinib and the Challenges of Prearranged Progression Biopsies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology is now available. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "The mechanisms of acquired resistance to the irreversible EGFR inhibitor afatinib are not well documented. We performed this prospective clinical trial to determine the prevalence of the mutation T790M in afatinib-resistant patients."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "Eligible patients had EGFR mutations; they were tyrosine kinase inhibitor-naive and were treated with afatinib, 40 mg daily. At enrollment, patients consented to a future repeat biopsy at the time of acquired resistance. A total of 24 patients were enrolled. The objective response rate was 58% (95% confidence interval [CI]: 37-78) with a median progression-free survival of 11.4 months (95% CI: 5.9-13.7) and median overall survival of 20.8 months (95% CI: 15.1-40.5). Of the 24 patients enrolled, 23 progressed and only 14 completed repeat biopsy at time of progression, with 11 samples sufficient for molecular analysis. Of those 11 patients, four (36% [95% CI: 10.9-69.2]) harbored T790M. T790M is likely a common resistance mechanism in patients treated with first-line afatinib."

According to the news editors, the research concluded: "Although repeat biopsies at progression are crucial in elucidating resistance mechanisms, this study suggests that clinical and technical issues often limit their feasibility, highlighting the importance of developing noninvasive tumor-genotyping strategies."

Our news journalists report that additional information may be obtained by contacting L.V. Sequist, Harvard Med Sch, Boston, MA, United States. Additional authors for this research include D. Gerber, J.F. Gainor, R.S. Heist, J.S. Temel, A.T. Shaw, P. Fidias, A. Muzikansky, J.A. Engelman and L.V. Sequist.

Heart Disorders and Diseases - Heart Failure

Study Findings from Heart and Vascular Institute Broaden Understanding of Heart Failure (Increased mortality with elevated plasma endothelin-1 in acute heart failure: an ASCEND-HF biomarker substudy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Heart Failure have been presented. According to news reporting out of Cleveland, Ohio, by NewsRx editors, research stated, "Endothelin-1 (ET-1) is an endogenous vasoconstrictor implicated in pulmonary and systemic hypertension, as well as ventricular dysfunction, through effects on vascular smooth muscle, the kidneys, and cardiomyocytes. We aimed to determine the association between serial ET-1 levels and acute heart failure patient outcomes."

Financial support for this research came from Scios Inc. Janssen Research & Development LLC.

Our news journalists obtained a quote from the research from Heart and Vascular Institute, "We measured plasma ET-1 at baseline, 48-72 h, and 30 days in a cohort of 872 patients hospitalized with acute heart failure from the ASCEND-HF trial (randomized to nesiritide vs. placebo), and its association with 30-day mortality, 180-day mortality, in-hospital death or worsening heart failure, and 30-day mortality or rehospitalization. Median ET-1 was 7.6 [interquartile range (IQR) 5.9-10] pg/mL at baseline, 6.3 (IQR 4.9-8.1) pg/mL at 48-72 h, and 5.9 (IQR 4.7-7.9) pg/mL at 30 days (p <0.001). Baseline and 48-72 h ET-1 were found to be independently associated with 180-day mortality in a multivariable analysis [hazard ratio (HR) 1.6, 95% confidence interval (CI) 1.3-2.0, p<0.001 and HR 1.5, 95% CI 1.2-1.9, p=0.001, respectively, log-transformed]. ET-1 that was measured at 48-72 h was also independently associated with death or worsening heart failure prior to discharge [odds ratio (OR) 1.6, 95% CI 1.03-2.4, p=0.03]. These independent associations remained significant after including NT-proBNP in the multivariable analysis."

According to the news editors, the research concluded: "We observed an independent association between elevated ET-1 and short-term in-hospital clinical outcomes and 180-day mortality in hospitalized patients with acute heart failure ET-1 provided additional prognostic information which was incremental to that yielded by NT-proBNP."

Our news journalists report that additional information may be obtained by contacting A.L. Perez, Heart and Vascular Institute, Cleveland Clinic, Cleveland, OH, United States. Additional authors for this research include J.L. Grodin, Y. Wu, A.F. Hernandez, J. Butler, M. Metra, G.M. Felker, A.A. Voors, J.J. McMurray, P.W. Armstrong, R.C. Starling, C.M. O'Connor and W.H Tang.

Study Findings from Hiroshima University Broaden Understanding of Esophageal Cancer (Role of definitive chemoradiotherapy using docetaxel and 5-fluorouracil in patients with unresectable locally advanced esophageal squamous cell carcinoma: a ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Esophageal Cancer. According to news reporting out of Hiroshima, Japan, by NewsRx editors, research stated, "Definitive chemoradiotherapy (CRT) with docetaxel (DOC) and 5-fluorouracil (5-FU) is a unique regimen for esophageal cancer. In this prospective phase II study, antitumor effect and safety of CRT using DOC and 5-FU for inoperable locally advanced esophageal cancer were evaluated."

Our news journalists obtained a quote from the research from Hiroshima University, "DOC 7.5mg/m(2) was infused on days 1, 8, 22, and 29. 5-FU 250mg/m(2)/day was infused continuously on days 1-5, 8-12, 15-19, 22-26, 29-33, 36-40, and 43-45. Radiotherapy was given to 66Gy in 33 fractions. Eleven patients with thoracic and five with cervical esophageal cancer were eligible. All patients had esophageal squamous cell carcinoma (ESCC). The response rate was 94%, with complete response in five patients (31%) and partial response in 10 (63%). Hematologic toxicity was mild; only one patient (6%) had Grade 1 leukopenia. Nonhematologic Grade 3 or higher adverse events were esophagitis (31%), anorexia (6%), and esophago-bronchial fistula (6%). No treatment-related deaths occurred. The median time to progression was 20 months and overall 3-year and 5-year survival were 44% and 31%, respectively. Definitive CRT using DOC and 5-FU could be performed safely, and it demonstrated a favorable antitumor effect for ESCC."

According to the news editors, the research concluded: "This regimen might be indicated in patients in whom it is desirable to avoid myelosuppression and progression of renal impairment."

Our news journalists report that additional information may be obtained by contacting M. Okada, Hiroshima University, Res Inst Radian Biol & Med, Dept. of Surg Oncol, Hiroshima, Japan. Additional authors for this research include Y. Hamai, M. Emi, Y. Murakami, M. Kenjo, Y. Nagata and M. Okada.

Oncology - Colon Cancer

Study Findings from Hong Kong Baptist University Broaden Understanding of Colon Cancer [Determination of amino acids in colon cancer cells by using UHPLC-MS/MS and [U-C-13(5)]-glutamine as the isotope tracer]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week-- Investigators discuss new findings in Oncology - Colon Cancer. According to news reporting out of Hong Kong, People's Republic of China, by NewsRx editors, research stated, "Rapid and simple quantitative analysis of intracellular metabolites is a critical tool for monitoring the alteration of biologically significant metabolites in cell lines or in vivo. We established an ultra-high performance liquid chromatography (UHPLC) method, equipped with hydrophilic interaction liquid chromatography (HILIC) column coupled to tandem mass spectrometry (MS/MS) for the simultaneous determination of 19 amino acids and 2 related derivatives in human cell lines."

Our news journalists obtained a quote from the research from Hong Kong Baptist University, "Chromatographic separation was achieved within 20 min using a BEH amide column, with aqueous mobile phase containing 20 mM ammonium acetate and 20 mM ammonium hydroxide, and acetonitrile as the organic mobile phase. Amino acids were analyzed in positive ion multiple reaction monitoring (MRM) mode without the need of derivatization. Intra- and inter-day precisions were less than 13.7%. The method was successfully applied to simultaneously detect the 21 compounds in a human colon cancer cell line DLD1. Moreover, metabolite fate of glutamine-derived carbons into amino acids in DLD1 cells was successfully traced by using [U-(13)C5]glutamine as the isotope tracer. Metabolic consequences of glutaminolysis inhibition on amino acid metabolism were evaluated."

According to the news editors, the research concluded: "Analysis of C-12- and U-C-13-labeled amino acids revealed the significantly decreased incorporation of [U-(13)C5]-glutamine derived carbons into aspartate, alanine and ornithine, indicating impaired metabolic flux via the tricarboxylic acid cycle and the urea cycle."

For more information on this research see: Determination of amino acids in colon cancer cells by using UHPLC-MS/MS and [U-C-13(5)]-glutamine as the isotope tracer. Talanta, 2017;162():285-292. Study Findings from Huazhong University of Science and Technology Provide New Insights into Bladder Cancer (Pre-instillation of tumor microparticles enhances intravesical chemotherapy of nonmuscle-invasive bladder cancer through a lysosomal ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Bladder Cancer is now available. According to news reporting out of Wuhan, People's Republic of China, by NewsRx editors, research stated, "Nonmuscle-invasive bladder cancer (NMIBC) is treated with transurethral resection followed by intravesical chemotherapy. However, drug-resistant tumorigenic cells cannot be eliminated, leading to half of the treated cancers recur with increased stage and grade."

Financial supporters for this research include National Basic Research Program of China, National Science Fund for Distinguished Young Scholars of China, National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from the Huazhong University of Science and Technology, "Innovative approaches to enhance drug sensitivity and eradicate tumorigenic cells in NMIBC treatment are urgently needed. Here, we show that pre-instillation of tumor cell-derived microparticles (T-MP) as natural biomaterials markedly enhance the inhibitory effects of intravesical chemotherapy on growth and hematuria occurrence of orthotopic bladder cancer in mice. We provide evidence that T-MPs enter and increase the pH value of lysosomes from 4.6 to 5.6, leading to the migration of drug-loaded lysosomes along microtubule tracks toward the nucleus and discharging the drugs whereby for the entry of the nucleus."

According to the news editors, the research concluded: "We propose that T-MPs may function as a potent sensitizer for augmenting NMIBC chemotherapy with unprecedented clinical benefits."

For more information on this research see: Pre-instillation of tumor microparticles enhances intravesical chemotherapy of nonmuscle-invasive bladder cancer through a lysosomal pathway. Biomaterials, 2017;113();93-104. Biomaterials can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. Cardiovascular Diseases and Conditions -...

Study Findings from Indiana University School of Medicine Broaden Understanding of Hypertension (Treating hypertension in hemodialysis improves symptoms seemingly unrelated to volume excess)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Hypertension is the subject of a report. According to news originating from Indianapolis, Indiana, by NewsRx editors, the research stated, "Among hemodialysis patients, probing dry weight is an effective strategy for improving control of hypertension. Whether controlling hypertension improves or worsens symptoms among such patients remains unclear."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from the Indiana University School of Medicine, "The purpose of the study was to develop a tool to evaluate symptoms and examine the relationship of the change in these symptoms with blood pressure (BP) control. Among patients participating in the Hemodialysis Patients Treated with Atenolol or Lisinopril (HDPAL) randomized controlled trial, a confirmatory factor analysis (CFA) was performed to establish the relationship between symptoms and organ systems. Next, the change in symptom scores pertaining to organ systems was analyzed using a mixed model. Finally, the independent effect of lowering home BP on change in symptoms was evaluated. Among 133 participants where symptoms were available at baseline, CFA revealed four level 1 domains: gastrointestinal symptoms, dialysis-related symptoms, cardiovascular symptoms and general symptoms. All except dialysis-related symptoms were ascribed to uremia (level 2 domain). Uremic symptoms improved over 6 months and then increased. Dialysis-related symptoms (fatigue, cramps and orthostatic dizziness) did not worsen despite lowering home BP. Probing dry weight was independently associated with an improvement in cardiovascular symptoms such as shortness of breath. Reducing BP through the use of a strategy that includes volume control and medication improves symptoms seemingly unrelated to volume excess."

According to the news editors, the research concluded: "In long-term hemodialysis patients, treating hypertension using home BP measurements may improve well-being."

The news correspondents report that additional information may be obtained from R. Agarwal, Indiana University School of Medicine and Richard L Roudebush Veterans Affairs Administration Medical Center, Indianapolis, IN, United States.

Gram-Positive Bacteria - Staphylococcus aureus

Study Findings from Indiana University School of Medicine Broaden Understanding of Staphylococcus aureus (Topical Prostaglandin E Analog Restores Defective Dendritic Cell-Mediated Th17 Host Defense Against Methicillin-Resistant Staphylococcus ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Positive Bacteria - Staphylococcus aureus. According to news reporting originating from Indianapolis, Indiana, by NewsRx correspondents, research stated, "People with diabetes are more prone to Staphylococcus aureus skin infection than healthy individuals. Control of S. aureus infection depends on dendritic cell (DC)-induced T-helper 17 (Th17)-mediated neutrophil recruitment and bacterial clearance. DC ingestion of infected apoptotic cells (IACs) drive prostaglandin E-2 (PGE(2)) secretion to generate Th17 cells."

Our news editors obtained a quote from the research from the Indiana University School of Medicine, "We speculated that hyperglycemia inhibits skin DC migration to the lymph nodes and impairs the Th17 differentiation that accounts for poor skin host defense in diabetic mice. Diabetic mice showed increased skin lesion size and bacterial load and decreased PGE2 secretion and Th17 cells compared with nondiabetic mice after methicillin-resistant S. aureus (MRSA) infection. Bone marrow-derived DCs (BMDCs) cultured in high glucose (25 mmol/L) exhibited decreased Ptges mRNA expression, PGE2 production, lower CCR7-dependent DC migration, and diminished maturation after recognition of MRSA-IACs than BMDCs cultured in low glucose (5 mmol/L). Similar events were observed in DCs from diabetic mice infected with MRSA. Topical treatment of diabetic mice with the PGE analog misoprostol improved host defense against MRSA skin infection by restoring DC migration to draining lymph nodes, Th17 differentiation, and increased antimicrobial peptide expression."

According to the news editors, the research concluded: "These findings identify a novel mechanism involved in poor skin host defense in diabetes and propose a targeted strategy to restore skin host defense in diabetes."

The news editors report that additional information may be obtained by contacting C.H. Serezani, Indiana Univ Sch Med, Dept. of Microbiol & Immunol, Indianapolis, IN 46202, United States. Additional authors for this research include S.L. Brandt, A. Pineros, N.L. Glosson-Byers, S. Wang, Y.M. Son, A.I. Medeiros and C.H. Serezani.

Study Findings from Indiana University-Purdue University Provide New Insights into Zoledronate Therapy (Zoledronate treatment has different effects in mouse strains with contrasting baseline bone mechanical phenotypes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Zoledronate Therapy are discussed in a new report. According to news originating from Indianapolis, Indiana, by NewsRx correspondents, research stated, "Two strains of mice with distinct bone morphologies and mechanical properties were treated with zoledronate. Our results show a different response to drug treatment in the two strains providing evidence that baseline properties of structure/material may influence response to zoledronate."

Funders for this research include National Institute of Arthritis and Musculoskeletal and Skin Diseases, National Institute of Diabetes and Digestive and Kidney Diseases, National Institutes of Health.

Our news journalists obtained a quote from the research from Indiana University-Purdue University, "Bisphosphonates are highly effective in reducing fracture risk, yet some individuals treated with these agents still experience fracture. The goal of this study was to test the hypothesis that genotype influences the effect of zoledronate on bone mechanical properties. Skeletally mature male mice from genetic backgrounds known to have distinct baseline post-yield properties (C57/B6, high post-yield displacement; A/J, low post-yield displacement) were treated for 8 weeks with saline (VEH) or zoledronate (ZOL, 0.06 mg/kg subcutaneously once every 4 weeks) in a 2 x 2 study design. Ex vivo mu CT and mechanical testing (4-pt bending) were conducted on the femur to assess morphological and mechanical differences. Significant drug and/or genotype effects were found for several mechanical properties and significant drug x genotype interactions were found for measures of strength (ultimate force) and brittleness (total displacement, strain to failure). Treatment with ZOL affected bone biomechanical measures of brittleness (total displacement (-25 %) and strain to failure (-23 %)) in B6 mice significantly differently than in A/J mice. This was driven by unique drug x genotype effects on bone geometry in B6 animals yet likely also reflected changes to the tissue properties."

According to the news editors, the research concluded: "These data may support the concept that properties of the bone geometry and/or tissue at the time of treatment initiation play a role in determining the bone's mechanical response to zoledronate treatment."
